Cover Design: Christine Nay

Revision History
15 November 2010—Revision 2
4 June 2010—Revision 1

The information in this document is current as of the date listed in the revision history.

SOFTWARE LICENSE

The terms and conditions for using this software are described in the software license contained in the acknowledgment to your purchase order or, to the extent applicable, to any reseller agreement or end-user purchase agreement executed between you and Juniper Networks. By using this software, you indicate that you understand and agree to be bound by those terms and conditions.

Generally speaking, the software license restricts the manner in which you are permitted to use the software and may contain prohibitions against certain uses. The software license may state conditions under which the license is automatically terminated. You should consult the license for further details.

For complete product documentation, please see the Juniper Networks Web site at www.juniper.net/techpubs.

END USER LICENSE AGREEMENT

READ THIS END USER LICENSE AGREEMENT ("AGREEMENT") BEFORE DOWNLOADING, INSTALLING, OR USING THE SOFTWARE. BY DOWNLOADING, INSTALLING, OR USING THE SOFTWARE OR OTHERWISE EXPRESSING YOUR AGREEMENT TO THE TERMS CONTAINED HEREIN, YOU (AS CUSTOMER OR IF YOU ARE NOT THE CUSTOMER, AS A REPRESENTATIVE/AGENT AUTHORIZED TO BIND THE CUSTOMER) CONSENT TO BE BOUND BY THIS AGREEMENT. IF YOU DO NOT OR CANNOT AGREE TO THE TERMS CONTAINED HEREIN, THEN (A) DO NOT DOWNLOAD, INSTALL, OR USE THE SOFTWARE, AND (B) YOU MAY CONTACT JUNIPER NETWORKS REGARDING LICENSE TERMS.

1. **The Parties.** The parties to this Agreement are (i) Juniper Networks, Inc. (if the Customer's principal office is located in the Americas) or Juniper Networks (Cayman) Limited (if the Customer's principal office is located outside the Americas) (such applicable entity being referred to herein as "Juniper"), and (ii) the person or organization that originally purchased from Juniper or an authorized Juniper reseller the applicable license(s) for use of the Software ("Customer") (collectively, the "Parties").

2. **The Software.** In this Agreement, "Software" means the program modules and features of the Juniper or Juniper-supplied software, for which Customer has paid the applicable license or support fees to Juniper or an authorized Juniper reseller, or which was embedded by Juniper in equipment which Customer purchased from Juniper or an authorized Juniper reseller. "Software" also includes updates, upgrades and new releases of such software. "Embedded Software" means Software which Juniper has embedded in or loaded onto the Juniper equipment and any updates, upgrades, additions or replacements which are subsequently embedded in or loaded onto the equipment.

3. **License Grant.** Subject to payment of the applicable fees and the limitations and restrictions set forth herein, Juniper grants to Customer a non-exclusive and non-transferable license, without right to sublicense, to use the Software, in executable form only, subject to the following use restrictions:

a. Customer shall use Embedded Software solely as embedded in, and for execution on, Juniper equipment originally purchased by Customer from Juniper or an authorized Juniper reseller.

b. Customer shall use the Software on a single hardware chassis having a single processing unit, or as many chassis or processing units for which Customer has paid the applicable license fees; provided, however, with respect to the Steel-Belted Radius or Odyssey Access Client software only, Customer shall use such Software on a single computer containing a single physical random access memory space and containing any number of processors. Use of the Steel-Belted Radius or IMS AAA software on multiple computers or virtual machines (e.g., Solaris zones) requires multiple licenses, regardless of whether such computers or virtualizations are physically contained on a single chassis.

c. Product purchase documents, paper or electronic user documentation, and/or the particular licenses purchased by Customer may specify limits to Customer's use of the Software. Such limits may restrict use to a maximum number of seats, registered endpoints, concurrent users, sessions, calls, connections, subscribers, clusters, nodes, realms, devices, links, ports or transactions, or require the purchase of separate licenses to use particular features, functionalities, services, applications, operations, or capabilities, or provide throughput, performance, configuration, bandwidth, interface, processing, temporal, or geographical limits. In addition, such limits may restrict the use of the Software to managing certain kinds of networks or require the Software to be used only in conjunction with other specific Software. Customer's use of the Software shall be subject to all such limitations and purchase of all applicable licenses.

d. For any trial copy of the Software, Customer's right to use the Software expires 30 days after download, installation or use of the Software. Customer may operate the Software after the 30-day trial period only if Customer pays for a license to do so. Customer may not extend or create an additional trial period by re-installing the Software after the 30-day trial period.

e. The Global Enterprise Edition of the Steel-Belted Radius software may be used by Customer only to manage access to Customer's enterprise network. Specifically, service provider customers are expressly prohibited from using the Global Enterprise Edition of the Steel-Belted Radius software to support any commercial network access services.

The foregoing license is not transferable or assignable by Customer. No license is granted herein to any user who did not originally purchase the applicable license(s) for the Software from Juniper or an authorized Juniper reseller.

4. **Use Prohibitions.** Notwithstanding the foregoing, the license provided herein does not permit the Customer to, and Customer agrees not to and shall not: (a) modify, unbundle, reverse engineer, or create derivative works based on the Software; (b) make unauthorized

copies of the Software (except as necessary for backup purposes); (c) rent, sell, transfer, or grant any rights in and to any copy of the Software, in any form, to any third party; (d) remove any proprietary notices, labels, or marks on or in any copy of the Software or any product in which the Software is embedded; (e) distribute any copy of the Software to any third party, including as may be embedded in Juniper equipment sold in the secondhand market; (f) use any 'locked' or key-restricted feature, function, service, application, operation, or capability without first purchasing the applicable license(s) and obtaining a valid key from Juniper, even if such feature, function, service, application, operation, or capability is enabled without a key; (g) distribute any key for the Software provided by Juniper to any third party; (h) use the Software in any manner that extends or is broader than the uses purchased by Customer from Juniper or an authorized Juniper reseller; (i) use Embedded Software on non-Juniper equipment; (j) use Embedded Software (or make it available for use) on Juniper equipment that the Customer did not originally purchase from Juniper or an authorized Juniper reseller; (k) disclose the results of testing or benchmarking of the Software to any third party without the prior written consent of Juniper; or (l) use the Software in any manner other than as expressly provided herein.

5. **Audit.** Customer shall maintain accurate records as necessary to verify compliance with this Agreement. Upon request by Juniper, Customer shall furnish such records to Juniper and certify its compliance with this Agreement.

6. **Confidentiality.** The Parties agree that aspects of the Software and associated documentation are the confidential property of Juniper. As such, Customer shall exercise all reasonable commercial efforts to maintain the Software and associated documentation in confidence, which at a minimum includes restricting access to the Software to Customer employees and contractors having a need to use the Software for Customer's internal business purposes.

7. **Ownership.** Juniper and Juniper's licensors, respectively, retain ownership of all right, title, and interest (including copyright) in and to the Software, associated documentation, and all copies of the Software. Nothing in this Agreement constitutes a transfer or conveyance of any right, title, or interest in the Software or associated documentation, or a sale of the Software, associated documentation, or copies of the Software.

8. **Warranty, Limitation of Liability, Disclaimer of Warranty.** The warranty applicable to the Software shall be as set forth in the warranty statement that accompanies the Software (the "Warranty Statement"). Nothing in this Agreement shall give rise to any obligation to support the Software. Support services may be purchased separately. Any such support shall be governed by a separate, written support services agreement. TO THE MAXIMUM EXTENT PERMITTED BY LAW, JUNIPER SHALL NOT BE LIABLE FOR ANY LOST PROFITS, LOSS OF DATA, OR COSTS OR PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES, OR FOR ANY SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THIS AGREEMENT, THE SOFTWARE, OR ANY JUNIPER OR JUNIPER-SUPPLIED SOFTWARE. IN NO EVENT SHALL JUNIPER BE LIABLE FOR DAMAGES ARISING FROM UNAUTHORIZED OR IMPROPER USE OF ANY JUNIPER OR JUNIPER-SUPPLIED SOFTWARE. EXCEPT AS EXPRESSLY PROVIDED IN THE WARRANTY STATEMENT TO THE EXTENT PERMITTED BY LAW, JUNIPER DISCLAIMS ANY AND ALL WARRANTIES IN AND TO THE SOFTWARE (WHETHER EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE), INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NONINFRINGEMENT. IN NO EVENT DOES JUNIPER WARRANT THAT THE SOFTWARE, OR ANY EQUIPMENT OR NETWORK RUNNING THE SOFTWARE, WILL OPERATE WITHOUT ERROR OR INTERRUPTION, OR WILL BE FREE OF VULNERABILITY TO INTRUSION OR ATTACK. In no event shall Juniper's or its suppliers' or licensors' liability to Customer, whether in contract, tort (including negligence), breach of warranty, or otherwise, exceed the price paid by Customer for the Software that gave rise to the claim, or if the Software is embedded in another Juniper product, the price paid by Customer for such other product. Customer acknowledges and agrees that Juniper has set its prices and entered into this Agreement in reliance upon the disclaimers of warranty and the limitations of liability set forth herein, that the same reflect an allocation of risk between the Parties (including the risk that a contract remedy may fail of its essential purpose and cause consequential loss), and that the same form an essential basis of the bargain between the Parties.

9. **Termination.** Any breach of this Agreement or failure by Customer to pay any applicable fees due shall result in automatic termination of the license granted herein. Upon such termination, Customer shall destroy or return to Juniper all copies of the Software and related documentation in Customer's possession or control.

10. **Taxes.** All license fees payable under this agreement are exclusive of tax. Customer shall be responsible for paying Taxes arising from the purchase of the license, or importation or use of the Software. If applicable, valid exemption documentation for each taxing jurisdiction shall be provided to Juniper prior to invoicing, and Customer shall promptly notify Juniper if their exemption is revoked or modified. All payments made by Customer shall be net of any applicable withholding tax. Customer will provide reasonable assistance to Juniper in connection with such withholding taxes by promptly: providing Juniper with valid tax receipts and other required documentation showing Customer's payment of any withholding taxes; completing appropriate applications that would reduce the amount of withholding tax to be paid; and notifying and assisting Juniper in any audit or tax proceeding related to transactions hereunder. Customer shall comply with all applicable tax laws and regulations, and Customer will promptly pay or reimburse Juniper for all costs and damages related to any liability incurred by Juniper as a result of Customer's non-compliance or delay with its responsibilities herein. Customer's obligations under this Section shall survive termination or expiration of this Agreement.

11. **Export.** Customer agrees to comply with all applicable export laws and restrictions and regulations of any United States and any applicable foreign agency or authority, and not to export or re-export the Software or any direct product thereof in violation of any such

restrictions, laws or regulations, or without all necessary approvals. Customer shall be liable for any such violations. The version of the Software supplied to Customer may contain encryption or other capabilities restricting Customer's ability to export the Software without an export license.

12. **Commercial Computer Software.** The Software is "commercial computer software" and is provided with restricted rights. Use, duplication, or disclosure by the United States government is subject to restrictions set forth in this Agreement and as provided in DFARS 227.7201 through 227.7202-4, FAR 12.212, FAR 27.405(b)(2), FAR 52.227-19, or FAR 52.227-14(ALT III) as applicable.

13. **Interface Information.** To the extent required by applicable law, and at Customer's written request, Juniper shall provide Customer with the interface information needed to achieve interoperability between the Software and another independently created program, on payment of applicable fee, if any. Customer shall observe strict obligations of confidentiality with respect to such information and shall use such information in compliance with any applicable terms and conditions upon which Juniper makes such information available.

14. **Third Party Software.** Any licensor of Juniper whose software is embedded in the Software and any supplier of Juniper whose products or technology are embedded in (or services are accessed by) the Software shall be a third party beneficiary with respect to this Agreement, and such licensor or vendor shall have the right to enforce this Agreement in its own name as if it were Juniper. In addition, certain third party software may be provided with the Software and is subject to the accompanying license(s), if any, of its respective owner(s). To the extent portions of the Software are distributed under and subject to open source licenses obligating Juniper to make the source code for such portions publicly available (such as the GNU General Public License ("GPL") or the GNU Library General Public License ("LGPL")), Juniper will make such source code portions (including Juniper modifications, as appropriate) available upon request for a period of up to three years from the date of distribution. Such request can be made in writing to Juniper Networks, Inc., 1194 N. Mathilda Ave., Sunnyvale, CA 94089, ATTN: General Counsel. You may obtain a copy of the GPL at http://www.gnu.org/licenses/gpl.html, and a copy of the LGPL at http://www.gnu.org/licenses/lgpl.html .

15. **Miscellaneous.** This Agreement shall be governed by the laws of the State of California without reference to its conflicts of laws principles. The provisions of the U.N. Convention for the International Sale of Goods shall not apply to this Agreement. For any disputes arising under this Agreement, the Parties hereby consent to the personal and exclusive jurisdiction of, and venue in, the state and federal courts within Santa Clara County, California. This Agreement constitutes the entire and sole agreement between Juniper and the Customer with respect to the Software, and supersedes all prior and contemporaneous agreements relating to the Software, whether oral or written (including any inconsistent terms contained in a purchase order), except that the terms of a separate written agreement executed by an authorized Juniper representative and Customer shall govern to the extent such terms are inconsistent or conflict with terms contained herein. No modification to this Agreement nor any waiver of any rights hereunder shall be effective unless expressly assented to in writing by the party to be charged. If any portion of this Agreement is held invalid, the Parties agree that such invalidity shall not affect the validity of the remainder of this Agreement. This Agreement and associated documentation has been written in the English language, and the Parties agree that the English version will govern. (For Canada: Les parties aux présentés confirment leur volonté que cette convention de même que tous les documents y compris tout avis qui s'y rattaché, soient redigés en langue anglaise. (Translation: The parties confirm that this Agreement and all related documentation is and will be in the English language)).

About This Guide

How to Use This Guide

This guide, the *Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS*, provides the following information about Juniper Networks Junos Operating System (Junos OS) for J-EX Series switches: software feature descriptions, configuration examples and tasks, management and monitoring instructions, and reference information.

To download the Dell PowerConnect J-EX Series documentation listed in Table 1 on page lxix, see the following Dell support website:

http://www.support.dell.com/manuals

Table 1: List of J-EX Series Guides for Junos OS Release 10.3

Title	Description
Dell PowerConnect J-Series J-EX4200 Ethernet Switch Hardware Guide	Component descriptions, site preparation, installation, replacement, and safety and compliance information for J-EX4200 switches
Dell PowerConnect J-Series J-EX8208 Ethernet Switch Hardware Guide	Component descriptions, site preparation, installation, replacement, and safety and compliance information for J-EX8208 switches
Dell PowerConnect J-Series J-EX8216 Ethernet Switch Hardware Guide	Component descriptions, site preparation, installation, replacement, and safety and compliance information for J-EX8216 switches
Dell PowerConnect J-Series Ethernet Switch Complete Software Guide for Junos OS	Software feature descriptions, configuration examples, and tasks for Juniper Networks Junos OS for J-EX Series switches

To download additional Junos OS documentation for J-EX Series and all other PowerConnect J-Series products, see the following Juniper Networks support website: http://www.juniper.net/techpubs/.

If the information in the latest release notes differs from the information in the documentation, follow the release notes.

Downloading Software

You can download Junos OS for J-EX Series switches from the Download Software area at http://www.support.dell.com/ . To download the software, you must have a Juniper Networks user account. For information about obtaining an account, see http://www.support.dell.com.

Documentation Conventions

Table 2: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.

Table 3: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the **configure** command: user@host> **configure**
`Fixed-width text like this`	Represents output that appears on the terminal screen.	`user@host>` **show chassis alarms** `No alarms currently active`
Italic text like this	• Introduces important new terms. • Identifies book names. • Identifies RFC and Internet draft titles.	• A policy *term* is a named structure that defines match conditions and actions. • *Junos OS System Basics Configuration Guide* • RFC 1997, *BGP Communities Attribute*
Italic text like this	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# **set system domain-name** *domain-name*
Plain text like this	Represents names of configuration statements, commands, files, and directories; IP addresses; configuration hierarchy levels; or labels on routing platform components.	• To configure a stub area, include the **stub** statement at the **[edit protocols ospf area area-id]** hierarchy level. • The console port is labeled **CONSOLE**.
< > (angle brackets)	Enclose optional keywords or variables.	**stub <default-metric** ***metric*****>;**

Table 3: Text and Syntax Conventions *(continued)*

Convention	Description	Examples
| (pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	**broadcast | multicast** (***string1*** **|** ***string2*** **|** ***string3***)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	**rsvp { # Required for dynamic MPLS only**
[ ] (square brackets)	Enclose a variable for which you can substitute one or more values.	**community name members [** ***community-ids*** **]**

Indention and braces ({ })	Identify a level in the configuration hierarchy.	[edit]
		routing-options {
		  static {
		  route default {
		  nexthop *address*;
		  retain;
		  }
		  }
		}

; (semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
J-Web GUI Conventions		
Bold text like this	Represents J-Web graphical user interface (GUI) items you click or select.	• In the Logical Interfaces box, select **All Interfaces**. • To cancel the configuration, click **Cancel**.
> (bold right angle bracket)	Separates levels in a hierarchy of J-Web selections.	In the configuration editor hierarchy, select **Protocols>Ospf**.

Repair and Warranty

CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that came with the product.

For more information, see the “Getting Help” chapter in your hardware guide.

Requesting Technical Support

For technical support, see http://www.support.dell.com. For more information, see “Getting Help” in the hardware guide for your Dell PowerConnect J-EX Series Ethernet Switch.

PART 1

Junos OS for J-EX Series Switches Product Overview

CHAPTER 1

Software Overview

J-EX Series Switch Software Features Overview

The following tables list the software features for J-EX Series Switches and the switches on which they are supported:

Table 4: Access Control Features

Feature	J-EX4200 Switches	J-EX8200 Switches
802.1X authentication	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Authentication fallback	Junos OS 10.3R1	Not supported
Captive portal authentication	Junos OS 10.2 or earlier	Not supported
Dynamic allocation of ternary content addressable memory (TCAM) memory to firewall filters	Junos OS 10.2 or earlier	Junos OS 10.3R1
Dynamic firewall filters for 802.1X authentication	Junos OS 10.2 or earlier	Not supported
Firewall filters and rate limiting	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
For a list of supported firewall filter match conditions and actions, see “Firewall Filter Match Conditions and Actions for J-EX Series Switches” on page 2728.		
Firewall filters on LAGs	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Firewall filter on loopback interface	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Firewall filters with IPv6	Junos OS 10.2 or earlier	Junos OS 10.3R1
MAC RADIUS authentication	Junos OS 10.2 or earlier	Junos OS 10.3R1
Policing	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Server fail fallback	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
TACACS+	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 5: Administration Features

Feature	J-EX4200 Switches	J-EX8200 Switches
System logging (syslog) over IPv6	Junos OS 10.2 or earlier	Not supported
System logging (syslog) over IPv4	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
System snapshot	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 6: Class-of-Service (CoS) Features

Feature	J-EX4200 Switches	J-EX8200 Switches
Class of service (CoS)—Class-based queuing with prioritization	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 6: Class-of-Service (CoS) Features *(continued)*

Feature	J-EX4200 Switches	J-EX8200 Switches
CoS—DSCP, IEEE 801.p, and IP precedence packet rewrites on routed VLAN interfaces (RVIs)	Junos OS 10.2 or earlier	Not supported
CoS—Interface-specific classifiers on routed VLAN interfaces (RVIs)	Junos OS 10.2 or earlier	Not supported
CoS—multidestination	Not applicable	Junos OS 10.2 or earlier
CoS support on LAGs	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
CoS support on routed VLAN interfaces (RVIs)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Interface-specific CoS rewrite rules	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Junos OS EZQoS for CoS	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Port shaping and queue shaping	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Remarking of bridged packets	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 7: High Availability and Resiliency Features

Feature	J-EX4200 Switches	J-EX8200 Switches
Graceful protocol restart for BGP	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Graceful protocol restart for IS-IS	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Graceful protocol restart for OSPF	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Graceful Routing Engine switchover (GRES) for J-EX4200 Virtual Chassis configurations	Junos OS 10.2 or earlier	Not applicable
GRES for ARP entries	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
GRES for the forwarding database	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
GRES for port security	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Link Aggregation Control Protocol (LACP)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
LACP support for dual-homing applications in data centers	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Link aggregation groups (LAGs)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Link aggregation groups (LAGs) over Virtual Chassis ports (VCPs)	Junos OS 10.2 or earlier	Not applicable

Table 7: High Availability and Resiliency Features *(continued)*

Feature	J-EX4200 Switches	J-EX8200 Switches
Redundant trunk groups	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Virtual Router Redundancy Protocol (VRRP)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
VRRP for IPv6 (except authentication type and authentication key)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Virtual Chassis • Atomic software upgrade • Fast failover • Split and merge	Junos OS 10.2 or earlier	Not applicable
Virtual Chassis • Automatic software update on prospective member switches • Front-panel configuration of uplink module ports as Virtual Chassis ports (VCPs)	Junos OS 10.2 or earlier	Not applicable
Virtual Chassis • Autoprovisioning of Virtual Chassis ports (VCPs)	Junos OS 10.2 or earlier	Not applicable
Virtual Chassis • Support for SFP uplink module ports	Junos OS 10.2 or earlier	Not applicable

Table 8: Interfaces Features

Feature	J-EX4200 Switches	J-EX8200 Switches
Digital optical monitoring (DOM)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Interface-range support	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Power over Ethernet (PoE)	Junos OS 10.2 or earlier	Not applicable
Power over Ethernet Plus (PoE+)	Not supported	Not supported
PoE power management mode	Junos OS 10.2 or earlier	Not supported
Unicast reverse-path forwarding (RPF)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
VLAN-tagged Layer 3 subinterfaces	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 9: IP Address Management Features

Feature	J-EX4200 Switches	J-EX8200 Switches
DHCP server and relay with option 82 for Layer 2 VLANs	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
DHCPv6 and IPv6 DNS	Junos OS 10.2 or earlier	Not supported
Local DHCP server	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Static addresses	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 10: IPv6 Features

Feature	J-EX4200 Switches	J-EX8200 Switches
A separate software license is required for IPv6. See “Understanding Software Licenses for the J-EX Series Switch” on page 65.		
IPv6 (except multicast protocols)	Junos OS 10.2 or earlier	Not supported
IPv6 CoS (multi-field classification and rewrite, scheduling based on TC),	Junos OS 10.2 or earlier	Not supported
IPv6 multicast protocols (PIM, MLDv1/v2)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
IPv6 Management and Services	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
IPv6 Path MTU Discovery	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 11: Layer 2 Network Protocols Features

Feature	J-EX4200 Switches	J-EX8200 Switches
802.1Q VLAN tagging	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
BPDU protection for spanning-tree protocols	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
GARP VLAN Registration Protocol (GVRP)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Layer 2 protocol tunneling (L2PT)	Junos OS 10.2 or earlier	Not supported
Link Layer Discovery Protocol (LLDP)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) with voice over IP (VoIP) integration	Junos OS 10.2 or earlier	Not supported
Loop protection for spanning-tree protocols	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
MAC-based VLAN	Junos OS 10.2 or earlier	Not supported
Multiple VLAN Registration Protocol (MVRP)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 11: Layer 2 Network Protocols Features *(continued)*

Feature	J-EX4200 Switches	J-EX8200 Switches
Private VLANs (PVLANs)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Proxy ARP—restricted	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Proxy ARP—unrestricted	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Proxy ARP per VLAN	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Q-in-Q tunneling	Junos OS 10.2 or earlier	Not supported
Q-in-Q VLAN extended support for multiple S-VLANs per access interface, firewall-filter-based VLAN assignment, and routed VLAN interfaces (RVIs)	Junos OS 10.2 or earlier	Not supported
Root protection for spanning-tree protocols	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Spanning tree: • Spanning Tree Protocol (STP) • Rapid Spanning Tree Protocol (RSTP) • Multiple Spanning Tree Protocol (MSTP)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Spanning tree: • VLAN Spanning Tree Protocol (VSTP)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
RSTP and VSTP concurrent configuration	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Storm control	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Unknown Layer 2 unicast forwarding	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
VLAN ID translation	Junos OS 10.2 or earlier	Not supported
VLAN range	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier

Table 12: Layer 3 Protocols Features

Feature	J-EX4200 Switches	J-EX8200 Switches
Bidirectional Forwarding Detection (BFD)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
Border Gateway Protocol (BGP)	Junos OS 10.2 or earlier	Junos OS 10.2 or earlier
A separate software license is required for BGP and MBGP. See “Understanding Software Licenses for the J-EX Series Switch” on page 65.

Security Features for J-EX Series Switches Overview

Juniper Networks Junos operating system (Junos OS) is a network operating system that has been hardened through the separation of control forwarding and services planes, with each function running in protected memory. The control-plane CPU is protected by rate limiting, routing policy, and firewall filters to ensure switch uptime even under severe attack. In addition, the switches fully integrate with the Juniper Networks Unified Access Control (UAC) product to provide both standards-based 802.1X port-level access and Layer 2 through Layer 4 policy enforcement based on user identity. Access port security features such as dynamic Address Resolution Protocol (ARP) inspection, DHCP snooping, and MAC limiting are controlled through a single Junos OS CLI command.

J-EX Series Switches provide the following hardware and software security features:

Console Port—Allows use of the console port to connect to the Routing Engine through an RJ-45 cable. You then use the command-line interface (CLI) to configure the switch.

Out-of-Band Management—A dedicated management Ethernet port on the rear panel allows out-of-band management.

Software Images—All Junos OS images are signed by Juniper Networks certificate authority (CA) with public key infrastructure (PKI).

User Authentication, Authorization, and Accounting (AAA)—Features include:

- User and group accounts with password encryption and authentication.
- Access privilege levels configurable for login classes and user templates.

- RADIUS authentication, TACACS+ authentication, or both, for authenticating users who attempt to access the switch.
- Auditing of configuration changes through system logging or RADIUS/TACACS+.

802.1X Authentication—Provides network access control. Supplicants (hosts) are authenticated when they initially connect to a LAN. Authenticating supplicants before they receive an IP address from a DHCP server prevents unauthorized supplicants from gaining access to the LAN. J-EX Series switches support Extensible Authentication Protocol (EAP) methods, including EAP-MD5, EAP-TLS, EAP-TTLS, and EAP-PEAP.

Port Security—Access port security features include:

- DHCP snooping—Filters and blocks ingress DHCP server messages on untrusted ports; builds and maintains an IP-address/MAC-address binding database (called the DHCP snooping database).
- Dynamic ARP inspection (DAI)—Prevents ARP spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons.
- MAC limiting—Protects against flooding of the Ethernet switching table.
- MAC move limiting—Detects MAC movement and MAC spoofing on access ports.
- Trusted DHCP server—With a DHCP server on a trusted port, protects against rogue DHCP servers sending leases.
- IP source guard—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. The source IP address in the packet sent from an untrusted access interface is validated against the source MAC address in the DHCP snooping database. The packet is allowed for further processing if the source IP address to source MAC address binding is valid; if the binding is not valid, the packet is discarded.
- DHCP option 82—Also known as the DHCP relay agent information option. Helps protect the J-EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.
- Unrestricted proxy ARP—The switch responds to all ARP messages with its own MAC address. Hosts that are connected to the switch's interfaces cannot communicate directly with other hosts. Instead, all communications between hosts go through the switch.
- Restricted proxy ARP—The switch does not respond to an ARP request if the physical networks of the source and target of the ARP request are the same. It does not matter whether the destination host has the same IP address as the incoming interface or a different (remote) IP address. An ARP request for a broadcast address elicits no reply.

Device Security—Storm control permits the switch to monitor unknown unicast and broadcast traffic and drop packets, or shut down, or temporarily disable the interface when a specified traffic level is exceeded, thus preventing packets from proliferating and degrading the LAN. You can enable storm control on access interfaces or trunk interfaces.

Firewall Filters—Allow auditing of various types of security violations, including attempts to access the switch from unauthorized locations. Firewall filters can detect such attempts and create audit log entries when they occur. The filters can also restrict access by limiting traffic to source and destination MAC addresses, specific protocols, or, in combination with policers, to specified data rates to prevent denial of service (DoS) attacks.

Policers—Provide rate-limiting capability to control the amount of traffic that enters an interface, which acts to counter DoS attacks.

Encryption Standards—Supported standards include:

- 128-, 192-, and 256-bit Advanced Encryption Standard (AES)
- 56-bit Data Encryption Standard (DES) and 168-bit 3DES

High Availability Features for J-EX Series Switches Overview

High availability refers to the hardware and software components that provide redundancy and reliability for packet-based communications. This topic covers the following high availability features of J-EX Series Switches:

VRRP

You can configure the Virtual Router Redundancy Protocol (VRRP) or VRRP for IPv6 on Gigabit Ethernet interfaces, 10-Gigabit Ethernet interfaces, and logical interfaces on J-EX Series switches. When VRRP is configured, the switches act as virtual routing platforms. VRRP enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. The VRRP routing platforms share the IP address corresponding to the default route configured on the hosts. At any time, one of the VRRP routing platforms is the master (active) and the others are backups. If the master routing platform fails, one of the backup routing platforms becomes the new master, providing a virtual default routing platform

and enabling traffic on the LAN to be routed without relying on a single routing platform. Using VRRP, a backup J-EX Series switch can take over a failed default switch within a few seconds. This is done with minimum loss of VRRP traffic and without any interaction with the hosts.

For more information on VRRP, see "Understanding VRRP on J-EX Series Switches" on page 1425.

Graceful Protocol Restart

With standard implementations of routing protocols, any service interruption requires an affected switch to recalculate adjacencies with neighboring switches, restore routing table entries, and update other protocol-specific information. An unprotected restart of a switch can result in forwarding delays, route flapping, wait times stemming from protocol reconvergence, and even dropped packets. Graceful protocol restart allows a restarting switch and its neighbors to continue forwarding packets without disrupting network performance. Because neighboring switches assist in the restart (these neighbors are called helper switches), the restarting switch can quickly resume full operation without recalculating algorithms from scratch.

On J-EX Series switches, graceful protocol restart can be applied to aggregate and static routes and for routing protocols (BGP, IS-IS, OSPF, and RIP).

Graceful protocol restart works similarly for the different routing protocols. The main benefits of graceful protocol restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful protocol restart thus allows a switch to pass through intermediate convergence states that are hidden from the rest of the network. Most graceful restart implementations define two types of switches—the restarting switch and the helper switch. The restarting switch requires rapid restoration of forwarding state information so that it can resume the forwarding of network traffic. The helper switch assists the restarting switch in this process. Individual graceful restart configuration statements typically apply to either the restarting switch or the helper switch.

Redundant Routing Engines

Two to ten J-EX4200 switches can be interconnected to create a Virtual Chassis configuration that operates as a single network entity. Every Virtual Chassis configuration has a master and a backup. The master acts as the master Routing Engine and the backup acts as the backup Routing Engine. The Routing Engine provides the following functionality:

- Runs various routing protocols
- Provides the forwarding table to the Packet Forwarding Engines (PFEs) in all the member switches of the Virtual Chassis configuration
- Runs other management and control processes for the entire Virtual Chassis configuration

The master Routing Engine, which is in the master of the Virtual Chassis configuration, runs Junos OS in the master role. It receives and transmits routing information, builds and maintains routing tables, communicates with interfaces and Packet Forwarding

Engine components of the member switches, and has full control over the Virtual Chassis configuration.

The backup Routing Engine, which is in the backup of the Virtual Chassis configuration, runs Junos OS in the backup role. It stays in sync with the master Routing Engine in terms of protocol states, forwarding tables, and so forth. If the master becomes unavailable, the backup Routing Engine takes over the functions that the master Routing Engine performs.

Graceful Routing Engine Switchover

You can configure graceful Routing Engine switchover (GRES) in a Virtual Chassis configuration, allowing the configuration to switch from the master Routing Engine in the master to the backup Routing Engine in the backup with minimal interruption to network communications. When you configure GRES, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and forwarding state. Any updates to the master Routing Engine are replicated to the backup Routing Engine as soon as they occur. If the kernel on the master Routing Engine stops operating, the master Routing Engine experiences a hardware failure, or the administrator initiates a manual switchover, mastership switches to the backup Routing Engine.

When the backup Routing Engine assumes mastership in a redundant failover configuration (that is, when graceful Routing Engine switchover is not enabled), the Packet Forwarding Engines initialize their state to boot up state before they connect to the new master Routing Engine. In contrast, in a graceful switchover configuration, the Packet Forwarding Engines do not reinitialize their state, but resynchronize their state with the new master Routing Engine. The interruption to the traffic is minimal.

Virtual Chassis Software Upgrade and Failover Features

J-EX4200 switches provide these features for increased resiliency in Virtual Chassis configurations:

- Virtual Chassis atomic software upgrade—When you upgrade software in a Virtual Chassis configuration, the upgrade will either succeed or fail on all member switches, preventing the situation in which only some of the Virtual Chassis member switches are upgraded.
- Virtual Chassis fast failover—A hardware-assisted failover mechanism that automatically reroutes traffic and reduces traffic loss in the event of a link failure.
- Virtual Chassis split and merge—If there is a disruption to the Virtual Chassis configuration due to member switches failing or being removed from the configuration, the Virtual Chassis configuration splits into two separate Virtual Chassis.

Link Aggregation

You can combine multiple physical Ethernet ports to form a logical point-to-point link, known as a *link aggregation group (LAG)* or *bundle*. A LAG provides more bandwidth than a single Ethernet link can provide. Additionally, link aggregation provides network

redundancy by load-balancing traffic across all available links. If one of the links should fail, the system automatically load-balances traffic across all remaining links.

You can select up to eight Ethernet interfaces and include them within a LAG. In a J-EX4200 Virtual Chassis configuration, the interfaces that form a LAG can be on different members of the Virtual Chassis. See "Understanding Virtual Chassis Configurations and Link Aggregation" on page 702.

Understanding Software Infrastructure and Processes

Each switch runs Junos OS for J-EX Series Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

NOTE:

To access the J-Web interface, your management device must have the following software installed:

- Operating system: Microsoft Windows XP Service Pack 3
- Browser version: One of the following. Other browsers might work but are not supported by J-Series platforms.
  - Microsoft Internet Explorer version 7.0
  - Mozilla Firefox version 3.0
- Additional requirements:
  - Only English-language browsers are supported.
  - The browser and the network must be able to receive and process HTTP/1.1 gzip compressed data.

- Routing Engine and Packet Forwarding Engine on page 22
- Junos OS Processes on page 23

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network

- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of Junos OS, for added flexibility.

Table 20 on page 23 describes the primary Junos OS processes.

Table 20: Junos OS Processes

Process	Name	Description
Chassis process	chassisd	Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.
Ethernet switching process	eswd	Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces. Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.
Forwarding process	pfem	Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Management process	mgd	Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the switch. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.

Table 20: Junos OS Processes *(continued)*

Process	Name	Description
Routing protocol process	rpd	Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.

CHAPTER 2

Supported Hardware

J-EX4200 Switches Hardware Overview

J-EX Series Switches provide scalable connectivity for the enterprise market, including branch offices, campus locations, and data centers. The switches run under Junos OS, which provides Layer 2 and Layer 3 switching, routing, and security services. The same Junos OS code base that runs on J-EX Series switches also runs on all Dell PowerConnect J-SRX Series Services Gateways.

J-EX4200 Switches

J-EX4200 switches provide connectivity for medium- and high-density environments and scalability for growing networks. These switches can be deployed wherever you need a high density of Gigabit Ethernet ports (24 to 480 ports) or redundancy. Typically, J-EX4200 switches are used in large branch offices, campus wiring closets, and data centers where they can be positioned as the top device in a rack to provide connectivity for all the devices in the rack.

You can connect individual J-EX4200 switches together to form one unit and manage the unit as a single chassis, called a *Virtual Chassis*. You can add more member switches to the Virtual Chassis as needed, up to a total of 10 members.

J-EX4200 switches are available in models with 24 or 48 ports and with 8 ports equipped for PoE. All models provide ports that have 10/100/1000Base-T Gigabit Ethernet connectors and optional 1-gigabit small form-factor pluggable (SFP) transceivers or 10-gigabit small form-factor pluggable (SFP+) transceivers for use with fiber connections.

Additionally, a 24-port model provides 100Base-FX/1000Base-X SFP ports. This model is typically used as a small distribution switch.

All J-EX4200 switches have dedicated 64-Gbps Virtual Chassis ports that allow you to connect the switches to each other. You can also use optional uplink module ports to connect members of a Virtual Chassis across multiple wiring closets.

To provide carrier-class reliability, J-EX4200 switches include:

- Dual redundant power supplies that are field-replaceable and hot-swappable. An optional additional connection to an external power source is also available.
- A field-replaceable fan tray with three fans. The switch remains operational if a single fan fails.
- Redundant Routing Engines in a Virtual Chassis configuration. This redundancy enables GRES (graceful Routing Engine switchover) and nonstop active routing.
- Junos OS with its modular design that enables failed system processes to gracefully restart.

Uplink Modules

Optional uplink modules are available for all J-EX4200 switches. Uplink modules provide four 1-gigabit small form-factor pluggable (SFP) transceivers or two 10-gigabit small form-factor pluggable (SFP+) transceivers. You can use SFP or SFP+ ports to connect an access switch to a distribution switch or to interconnect member switches of a Virtual Chassis across multiple wiring closets.

Power over Ethernet (PoE) Ports

PoE ports provide electrical current to devices through the network cables so that separate power cords for devices such as IP phones, wireless access points, and security cameras are unnecessary. J-EX4200 switches have partial (8-port) PoE capability.

J-EX4200 Switch Models

The J-EX4200 switch is available with 24 or 48 ports and with partial Power over Ethernet (PoE) capability. Table 21 on page 26 lists the J-EX4200 switch models.

Table 21: J-EX4200 Switch Models

Model	Ports	Number of PoE-enabled Ports	Power Supply (Minimum)
J-EX4200-24T	24 Gigabit Ethernet	First 8 ports	320 W
J-EX4200-48T	48 Gigabit Ethernet	First 8 ports	320 W
J-EX4200-24F	24 small form-factor pluggable (SFP) transceivers	Not applicable	320 W

J-EX8208 Switch Hardware Overview

Dell PowerConnect J-Series J-EX8208 Ethernet Switches provide high performance, scalable connectivity, and carrier-class reliability for high-density environments such as campus-aggregation and data-center networks. The J-EX8208 switch is a modular system that provides high availability and redundancy for all major hardware components, including Routing Engines, switch fabric, fan tray, and power supplies.

You can manage J-EX8208 switches using the same Junos OS interfaces that you use for other Junos OS platforms—the Junos OS command-line interface (CLI) and the J-Web graphical interface.

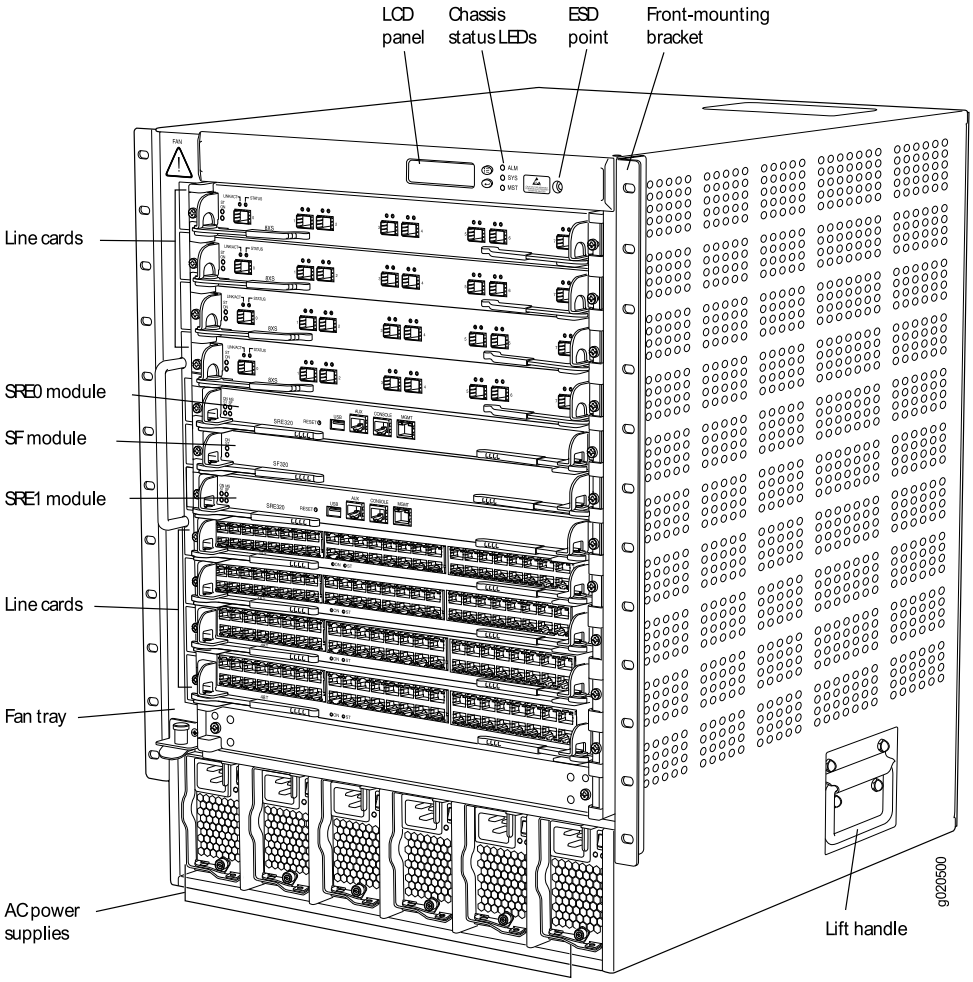
Software

The Dell PowerConnect J-EX Series Switches—PowerConnect J-EX4200 Ethernet Switches and PowerConnect J-EX8200 Ethernet Switches—run under Junos OS, which provides Layer 2 and Layer 3 switching, routing, and security services. The same Junos OS code base that runs on J-EX Series switches also runs on Dell PowerConnect J-SRX Series Services Gateways.

Chassis Physical Specifications

The J-EX8208 switch is 14 rack units (14 U) in size (1/3 rack); three J-EX8208 switches can fit in a standard 42 U rack. Each J-EX8208 switch is designed to optimize rack space and cabling. See Figure 1 on page 28.

Figure 1: J-EX8208 Switch



The J-EX8208 switch has a chassis-level LCD panel that displays Routing Engine and switch fabric status as well as chassis components' alarm information for rapid problem identification. The LCD panel provides a user-friendly interface for performing initial switch configuration, rolling back a configuration, or restoring the switch to its default settings. See LCD Panel in a J-EX8200 Switch.

The J-EX8208 chassis backplane distributes the data, control, and management signals to various system components along with distributing power throughout the system.

See Chassis Physical Specifications of a J-EX8208 Switch.

Routing Engines and Switch Fabric

Switching functionality, system management, and system control functions of a J-EX8208 switch are performed by the Switch Fabric and Routing Engine (SRE) module. See Switch Fabric and Routing Engine (SRE) Module in a J-EX8208 Switch. An SRE module contains a Routing Engine and switch fabric. The SRE modules are installed in the front of the chassis in the slots labeled SRE0 and SRE1. See Slot Numbering for a J-EX8208 Switch.

A base configuration J-EX8208 switch has one SRE module. A redundant configuration J-EX8208 switch has a second SRE module. See J-EX8208 Switch Configurations.

The Switch Fabric (SF) module, working with the SRE module, provides the necessary switching functionality to a base configuration J-EX8208 switch. The SF module is installed in the front of the chassis in the slot labeled SF. In a redundant configuration the SF module provides a redundant switch fabric. The additional switch fabric provides full 2+1 switch fabric redundancy to the switch. See Switch Fabric (SF) Module in a J-EX8208 Switch.

Line Cards

The J-EX8208 switch features eight horizontal line card slots and supports the line rate for each line card. The line cards in J-EX8200 switches combine a Packet Forwarding Engine and Ethernet interfaces on a single assembly. They are field-replaceable units (FRUs) that can be installed in the line card slots labeled 0 through 7 on the front of the switch chassis. See Slot Numbering for a J-EX8208 Switch. All line cards are hot-removable and hot-insertable.

The following line cards are available for J-EX8208 switches:

- 8-port 10-Gigabit Ethernet SFP+ line card: This line card has eight 10-gigabit SFP+ ports on its faceplate in which you can install SFP+ transceivers. See 8-port SFP+ Line Card in a J-EX8200 Switch.
- 48-port 100/1000 SFP line card: This line card has 48 1-gigabit SFP ports on its faceplate in which you can install SFP transceivers. See 48-port SFP Line Card in a J-EX8200 Switch.
- 48-port 10/100/1000 RJ-45 line card: This line card had 48 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors on its faceplate. See 48-port RJ-45 Line Card in a J-EX8200 Switch.

Cooling System

The cooling system in a J-EX8208 switch consists of a hot-removable and hot-insertable fan tray. The fan tray contains 12 fans. The fan tray installs vertically on the left front of the chassis and provides side-to-side chassis cooling. See Cooling System and Airflow in a J-EX8208 Switch.

Power Supplies

Power supplies for the J-EX8208 switch are fully redundant, load-sharing, and hot-removable and hot-insertable field-replaceable units (FRUs). Each J-EX8208 switch chassis can hold up to six 2000 W AC power supplies.

The 2000 W AC power supplies support both low-voltage line (100–120 VAC) and high-voltage line (200–240 VAC) AC power configurations on a J-EX8208 switch. Each 2000 W AC power supply delivers 2000 W of power at high voltage (200–240 VAC) or 1200 W at low voltage (100–120 VAC) to the J-EX8208 chassis.

Only two AC power supplies are required for the base AC configuration and switch powerup. The redundant AC configuration ships with six AC power supplies to provide the capacity to power the system using N+1 or N+N power redundancy.

J-EX8216 Switch Hardware Overview

The Dell PowerConnect J-Series J-EX8216 Ethernet Switch is a half-rack, midplane architecture, modular Ethernet switch that is designed for ultra high-density environments such as campus aggregation, data center, or high performance core switching environments. J-EX8216 switches provide high-availability and redundancy for all major hardware components, including Routing Engine (RE) modules, Switch Fabric (SF) modules, fan trays (with redundant fans), and load-sharing 2000 W AC and 3000 W AC power supplies. Like other J-EX8200 Ethernet Switches, J-EX8216 switches provide high performance, scalable connectivity, and carrier-class reliability.

You can manage J-EX8216 switches using the same Junos OS interfaces that you use for other Junos OS platforms—the Junos OS command-line interface (CLI) and the J-Web graphical interface.

Software

The Dell PowerConnect J-EX Series Switches—PowerConnect J-EX4200 Ethernet Switches and PowerConnect J-EX8200 Ethernet Switches—run under Junos OS, which provides Layer 2 and Layer 3 switching, routing, and security services. The same Junos OS code base that runs on J-EX Series switches also runs on Dell PowerConnect J-SRX Series Services Gateways.

Chassis Physical Specifications, LCD Panel, and Midplane

J-EX8216 switches are designed to optimize rack space and cabling. The J-EX8216 switch is 21 rack units (21 U) in size (1/2 rack); two J-EX8216 switches can fit in a standard 42 U rack. See Figure 2 on page 31 and Figure 3 on page 32 and Chassis Physical Specifications of a J-EX8216 Switch.

Figure 2: J-EX8216 Switch Front

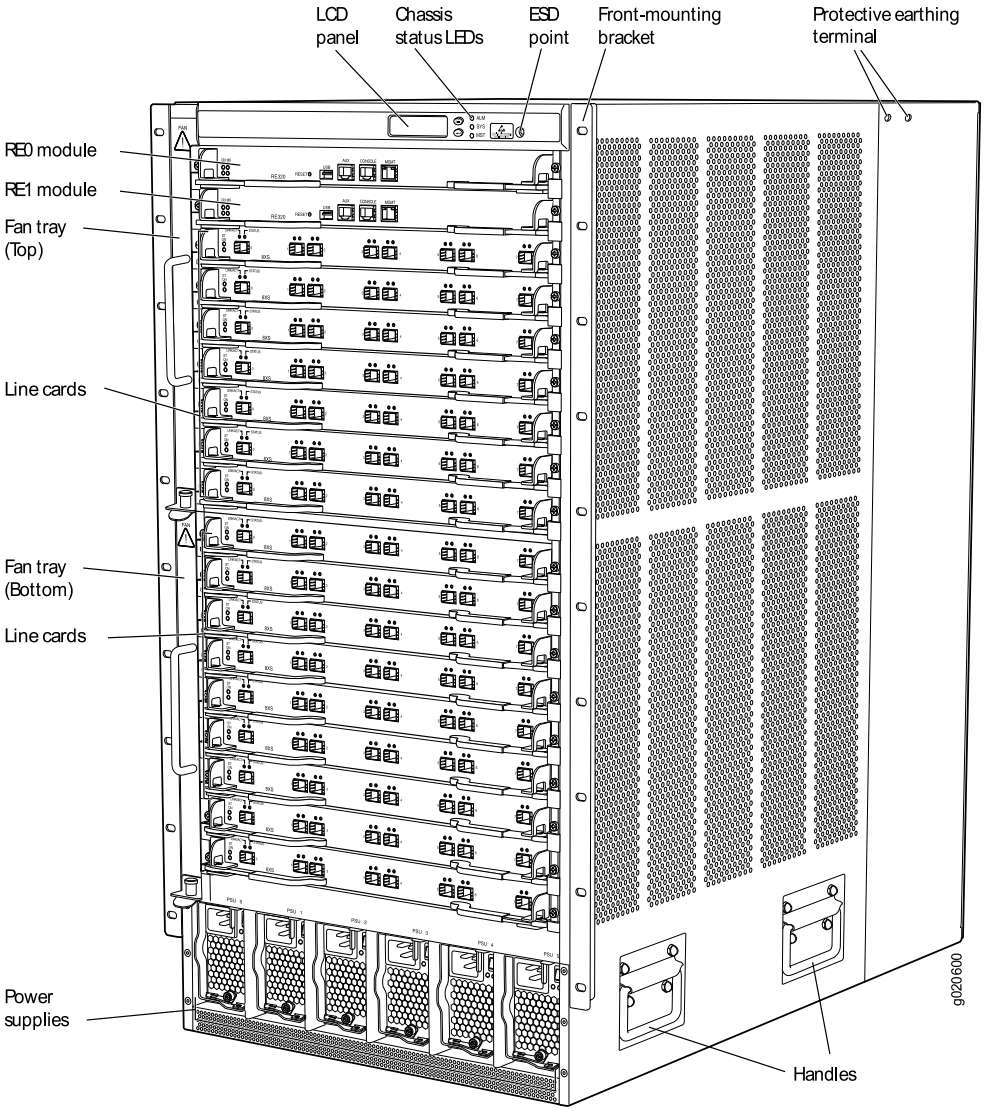

Figure 3: J-EX8216 Switch Rear

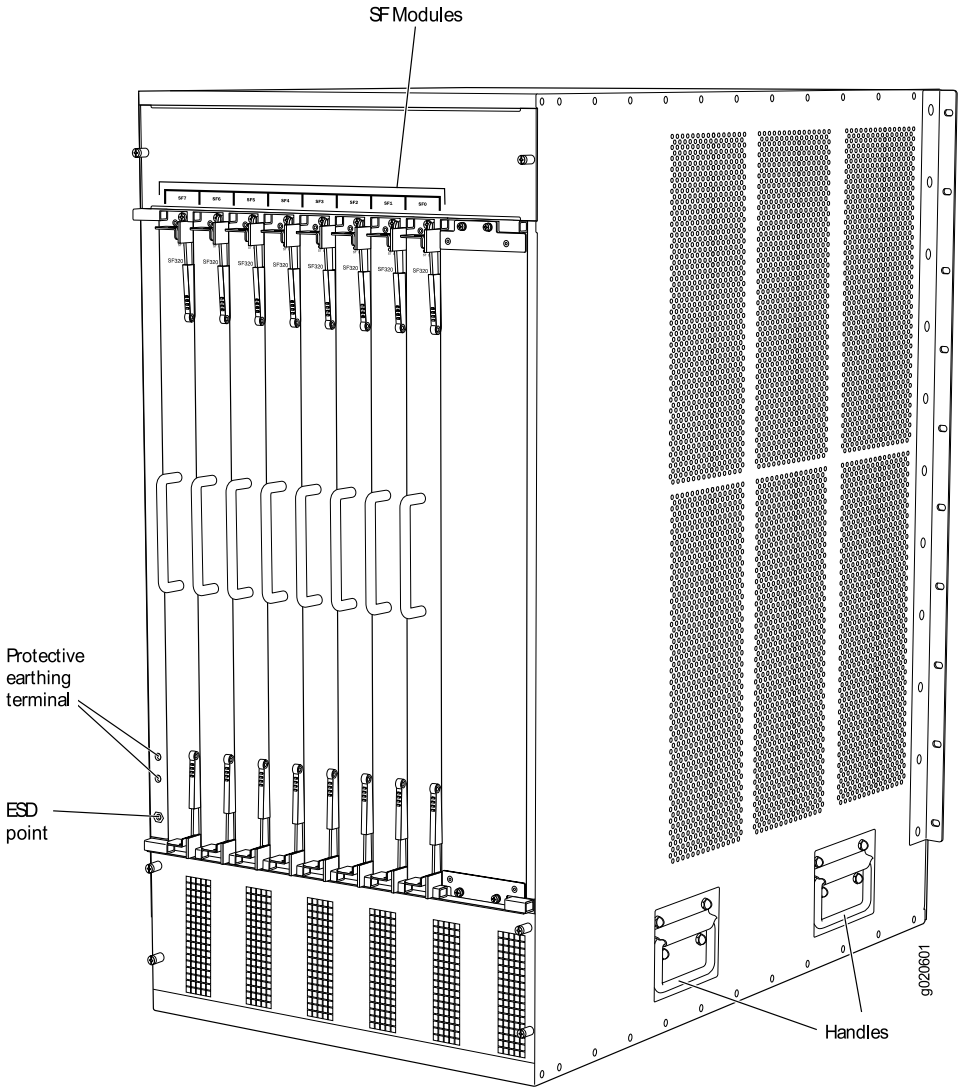

The J-EX8216 switch has a chassis-level LCD panel that displays Routing Engine and switch fabric status as well as chassis components' alarm information for rapid problem identification. The LCD panel provides a user-friendly interface for performing initial switch configuration, rolling back a configuration, or restoring the switch to the factory default configuration. See LCD Panel in a J-EX8200 Switch.

The J-EX8216 chassis midplane distributes the data, control, and management signals to system components and distributes power throughout the system. See Midplane in a J-EX8216 Switch.

Routing Engines and Switch Fabric

System management and system control functions of a J-EX8216 switch are performed by the Routing Engine (RE) module. An RE module contains a Routing Engine. The RE modules are hot-insertable and hot-removable field-replaceable units (FRUs) that are

installed in the front of the chassis in the slots labeled RE0 and RE1. A base configuration (AC version) J-EX8216 switch has one RE module. A redundant configuration J-EX8216 switch has a second RE module for redundancy. See Routing Engine (RE) Module in a J-EX8216 Switch and J-EX8216 Switch Configurations.

The Switch Fabric (SF) modules provide the switching functionality to a J-EX8216 switch. The SF modules are hot-insertable and hot-removable field-replaceable units (FRUs). All eight SF modules are installed in the rear of the chassis in the slots labeled SF7 through SF0. In a J-EX8216 switch, all eight SF modules are active and must be installed in the switch for normal operation. If a single SF module fails, the input/output traffic for that module is load-balanced among the remaining SF modules, providing graceful degradation in midplane performance. The impact of an SF module failure on the performance of a J-EX8216 switch varies based on the type of line cards installed in the switch and the traffic mix flowing through them. In a J-EX8216 switch configuration that is fully loaded with 8-port 10-Gigabit Ethernet SFP+ line cards, if one SF module fails, the remaining seven SF modules still have sufficient switching capacity to maintain continuous switch operation at full wire-rate performance. See Switch Fabric (SF) Modules in a J-EX8216 Switch.

Line Cards

The J-EX8216 switch features 16 horizontal line card slots and supports wire-rate performance for all packet sizes for the installed line cards. The line cards in J-EX8200 switches combine a Packet Forwarding Engine and Ethernet interfaces on a single assembly. They are field-replaceable units (FRUs), and you can install them in the slots labeled 0 through 15 on the front of the switch chassis. All line cards are hot-insertable and hot-removable.

The following line cards are available for J-EX8216 switches:

- 8-port 10-Gigabit Ethernet SFP+ line card: This line card has eight 10-gigabit SFP+ ports on its faceplate in which you can install SFP+ transceivers. See 8-port SFP+ Line Card in a J-EX8200 Switch.
- 48-port 100/1000 SFP line card: This line card has 48 1-gigabit SFP ports on its faceplate in which you can install SFP transceivers. See 48-port SFP Line Card in a J-EX8200 Switch.
- 48-port 10/100/1000 RJ-45 line card: This line card has 48 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors on its faceplate. See 48-port RJ-45 Line Card in a J-EX8200 Switch.

Cooling System

The cooling system in a J-EX8216 switch consists of two hot-insertable and hot-removable, field-replaceable unit (FRU) fan trays. Each fan tray contains nine fans. Both fan trays install vertically on the left front of the chassis and provide side-to-side chassis cooling and front-to-side cooling. The top and bottom fan trays are identical and interchangeable. However, only the top fan tray cools the SF modules installed in the rear of the chassis. See Cooling System and Airflow in a J-EX8216 Switch.

Power Supplies

Power supplies for the J-EX8216 switch are fully redundant, load-sharing, and hot-insertable and hot-removable field-replaceable units (FRUs). Each J-EX8216 switch chassis can hold up to six 2000 W AC or six 3000 W AC power supplies.

The 2000 W AC power supplies support both low-voltage line (100–120 VAC) and high-voltage line (200–240 VAC) AC power configurations on a J-EX8216 switch.

Each 3000 W AC power supply delivers 3000 W of power at high voltage (200–240 VAC) to the J-EX8216 chassis. Low-voltage input is not supported for the 3000 W AC power supplies on the J-EX8216 switch.

The redundant AC configuration ships with six AC power supplies to provide the capacity to power the system using N+1 or N+N power redundancy. See AC Power Supply in a J-EX8200 Switch and J-EX8216 Switch Configurations.

CAUTION: Mixing different types of power supplies in the same chassis is not a supported configuration.

PART 3

Software Installation

CHAPTER 4

Software Installation Overview

Installation Overview

Understanding Software Installation on J-EX Series Switches

A J-EX Series Switch is delivered with Junos OS preinstalled. As new features and software fixes become available, you must upgrade your software to use them. You can also downgrade Junos OS to a previous release.

This topic covers:

Overview of the Software Installation Process

A J-EX Series switch is delivered with Junos OS preinstalled. When you connect power to the switch, it starts (boots) up from the installed software.

You upgrade Junos OS on a J-EX Series switch by copying a software package to your switch or another system on your local network, then use either the J-Web interface or the CLI to install the new software package on the switch. Finally, you reboot the switch; it boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device.

NOTE:
To access the J-Web interface, your management device must have the following software installed:

- Operating system: Microsoft Windows XP Service Pack 3
- Browser version: One of the following. Other browsers might work but are not supported by J-Series platforms.
  - Microsoft Internet Explorer version 7.0
  - Mozilla Firefox version 3.0
- Additional requirements:
  - Only English-language browsers are supported.
  - The browser and the network must be able to receive and process HTTP/1.1 gzip compressed data.

During a successful upgrade, the upgrade package removes all files from **/var/tmp** and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert back to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

Software Package Security

Junos OS is delivered in signed packages that contain digital signatures to ensure it is official software. For more information about signed software packages, see the *Junos OS Installation and Upgrade Guide* at http://www.juniper.net/techpubs/software/junos/.

Installing Software on a Virtual Chassis

You can connect individual J-EX4200 Ethernet Switches together to form one unit and manage the unit as a single chassis, called a Virtual Chassis. The Virtual Chassis operates as a single network entity composed of members. Each member of a Virtual Chassis runs a Junos OS package.

For ease of management, the Virtual Chassis provides flexible methods to upgrade software releases. You can deploy a new software release to all members of a Virtual Chassis or to only a particular member.

Installing Software on J-EX8200 Switches with Redundant Routing Engines

To install software on a J-EX8200 Ethernet Switch that has two Routing Engines with minimal network disruption, you perform a Junos OS installation on each Routing Engine separately, starting with the backup. See “Installing Software on a J-EX8200 Switch with Redundant Routing Engines (CLI Procedure)” on page 71.

Installing Software Using Automatic Software Download

The automatic software download feature uses the DHCP message exchange process to download and install software packages. Users can define a path to a software package on the DHCP server and then the DHCP server communicates this path to J-EX Series switches acting as DHCP clients as part of the DHCP message exchange process. The DHCP clients that have been configured for automatic software download receive these messages and, when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, download and install the software package. See "Upgrading Software Using Automatic Software Download on J-EX Series Switches" on page 82.

Troubleshooting Software Installation

If Junos OS loads but the CLI is not working for any reason, or if the switch has no software installed, you can use the recovery installation procedure to install the software on the switch. See "Troubleshooting Software Installation" on page 91.

NOTE: You can also use this procedure to load two versions of Junos OS in separate partitions on the switch.

Related Documentation

- Installing Software on J-EX Series Switches (J-Web Procedure) on page 75
- Installing Software on a J-EX Series Switch with a Single Routing Engine (CLI Procedure) on page 70
- Installing Software on a J-EX8200 Switch with Redundant Routing Engines (CLI Procedure) on page 71

Junos OS Package Names

You upgrade Junos OS on a J-EX Series Switch by copying a software package to your switch or another system on your local network, then install the new software package on the switch.

A software package name is in the following format:

***package-name-m.nZx.y*-domestic-signed.tgz**

where:

- ***package-name*** is the name of the package—for example, **jinstall-ex-4200**.
- ***m.n*** is the software release, with ***m*** representing the major release number and *n* representing the minor release number—for example, **10.2**.
- ***Z*** indicates the type of software release, where **R** indicates released software and **B** indicates beta-level software.

- ***x.y*** represents the version of the major software release (*x*) and an internal tracking number (*y*)—for example, **1.6**.
- **domestic-signed** is appended to all J-EX Series package names. For most Junos OS packages, **domestic** is used for the United States and Canada and **export** for worldwide distribution. However, for J-EX Series software, **domestic** is used for worldwide distribution as well.

A sample J-EX Series software package name is:

```
jinstall-ex-4200-10.2R1.6-domestic-signed.tgz
```

- Understanding Software Installation on J-EX Series Switches on page 61

Understanding System Snapshot on J-EX Series Switches

You can create copies of the software running a J-EX Series Switch using the system snapshot feature. The system snapshot feature takes a "snapshot" of the files currently used to run the switch—the complete contents of the **/config** and **/var** directories, which include the running Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use this snapshot to boot the switch at the next bootup or as a backup boot option.

You can only use snapshots to move files to external memory if the switch was booted from internal memory, or to move files to internal memory if the switch was booted from external memory. You cannot create a snapshot in the memory source that booted the switch even if the snapshot is being created on a different partition in the same memory source.

Snapshots are particularly useful for moving files onto USB flash drives. You cannot use the **copy** command or any other file-moving technique to move files from an internal memory source to USB memory on the switch.

System snapshots on J-EX Series switches have the following limitations:

- You cannot use snapshots to move files to any destination outside of the switch other than an installed external USB flash drive or to move files between switches that are members of the same virtual chassis.
- Snapshot commands, like other virtual chassis commands, are always executed on a local switch. In cases where a different member switches of the same virtual chassis requests the snapshot, the snapshot command is pushed to the VC member creating the snapshot, executed, and the output is then returned to the switch that initiated the

process. For instance, if the command to create an external snapshot on virtual chassis member 3 is entered from virtual chassis member 1, the snapshot of internal memory on virtual chassis member 3 is taken on external memory on virtual chassis member 3. The output of the process is seen from virtual chassis member 1. No files move between the switches.

Related Documentation

- Understanding Software Installation on J-EX Series Switches on page 61
- Creating a Snapshot and Using It to Boot a J-EX Series Switch on page 80

Licenses Overview

Understanding Software Licenses for the J-EX Series Switch

To enable and use some Junos OS features, you must purchase, install, and manage separate software licenses. The presence on the switch of the appropriate software license keys (“passwords”) determines whether you are eligible to configure and use certain features.

Junos OS feature licenses are device specific. The same feature can be installed and configured on multiple switches. To conform to Junos OS feature licensing requirements, you must purchase a license for each switch.

For a Virtual Chassis deployment, two licenses are recommended for redundancy. These licenses can be based on the serial numbers of any two member switches. If you add additional member switches to the Virtual Chassis configuration, you do not need additional licenses.

Features Requiring a License

The following Junos OS features require an Advanced Feature License (AFL):

- Border Gateway Protocol (BGP) and multiprotocol BGP (MBGP)
- Intermediate System-to-Intermediate System (IS-IS)
- IPv6 routing (except multicast protocols)
- MPLS with RSVP-based label switched paths (LSPs) and MPLS-based circuit cross-connects (CCCs)

You can purchase a license for your J-EX Series switch model. The license allows you to run all the advanced software features on your switch.

For information about how to purchase a software license, contact Dell.

License Warning Messages

For features that require a license, you must install and properly configure a license key to meet the requirements for using the licensable feature. To obtain a license key, use the contact information provided in your Advanced Feature License (AFL) certificate.

If you have not purchased the AFL and installed the license key, you receive warnings after you commit a licensible feature. The system generates system log (**syslog**) alarm messages notifying you that the feature requires a license—for example:

```
Sep  3 05:59:11   craftd[806]:  Minor alarm set, BGP Routing Protocol usage
requires a license
Sep  3 05:59:11   alarmd[805]: Alarm set: License color=YELLOW, class=CHASSIS,
reason=BGP Routing Protocol usage requires a license
Sep  3 05:59:11   alarmd[805]: LICENSE_EXPIRED: License for feature bgp(47) expired
```

Output from the **show system alarms** command displays the active alarms—for example:

```
user@switch> show system alarms
1 alarm currently active
Alarm time               Class  Description
2009-09-03 06:00:11 UTC  Minor  BGP Routing Protocol usage requires a license
```

Every time you edit or view the configuration, a message displays the committed features that require a license. For example, when you edit the BGP configuration, a warning message appears—for example:

```
[edit protocols]
user@switch# bgp
warning: requires 'bgp' license
```

Likewise, viewing the configuration causes the system to display a message—for example:

```
user@switch> show configuration protocols
## Warning: requires 'bgp' license
##
bgp {
    hold-time 10;
    damping;
}
```

Related Documentation

- Managing Licenses for the J-EX Series Switch (J-Web Procedure) on page 84
- Monitoring Licenses for the J-EX Series Switch on page 88
- License Key Components for the J-EX Series Switch on page 66
- J-EX Series Switch Software Features Overview on page 3

License Key Components for the J-EX Series Switch

When you purchase a license for a Junos OS feature that requires a separate license, you receive a license key.

A license key consists of two parts:

- License ID—Alphanumeric string that uniquely identifies the license key. When a license is generated, it is given a license ID.
- License data—Block of binary data that defines and stores all license key objects.

For example, in the following typical license key, the string **JUNOS204558** is the license ID, and the trailing block of data is the license data:

```
JUNOS204558 aeaqea qmijhd amrqha ztfmbu gqzama uqceds
ra32zr lsevik ftvjed o4jy5u fynzzj mgviyl
kgioyf ardb5g sj7wnt rsfked wbjf5a sg
```

The license data defines the device ID for which the license is valid and the version of the license.

CHAPTER 5

Installing Junos OS

Downloading Software Packages

To upgrade Junos OS on your Dell PowerConnect J-EX Series switch, you can download software packages from the Dell PowerConnect J-Series—Juniper Networks partner website.

Before you can begin to download software upgrades, ensure that you have registered your J-EX Series switch and obtained an account. To register for an account:

1. Locate the chassis serial number (*not* the Dell Service Tag) on your J-EX Series switch.
2. Go to http://www.juniper.net/partners/dell/ and click **Register for an Account**.
3. Fill out the registration information required.

   When your user registration is approved, you receive login information and credentials at the e-mail address you used for registration. If your registration is delayed or additional information is required, you receive a message with further instructions.
4. Save the login information and credentials you receive to use for software download.

To download software upgrades from the Dell PowerConnect J-Series—Juniper Networks partner website:

1. Go to http://www.juniper.net/partners/dell/.
2. Select **J-EX**.
3. Select the appropriate software package for your application. See “Junos OS Package Names” on page 63.
4. Download the software to a local host or to an internal software distribution site.

If you have questions, contact Dell Customer Support at http://www.support.dell.com.

Related Documentation

- Installing Software on J-EX Series Switches (J-Web Procedure) on page 75
- Installing Software on a J-EX Series Switch with a Single Routing Engine (CLI Procedure) on page 70
- Understanding Software Installation on J-EX Series Switches on page 61

Installing Software on a J-EX Series Switch with a Single Routing Engine (CLI Procedure)

You can use this procedure to upgrade Junos OS on a J-EX Series switch with a single Routing Engine, including an individual member of a Virtual Chassis or all members of a Virtual Chassis, or a J-EX8200 switch using a single Routing Engine. To upgrade software on a J-EX8200 switch running two Routing Engines, see "Installing Software on a J-EX8200 Switch with Redundant Routing Engines (CLI Procedure)" on page 71.

To install software upgrades on a J-EX Series switch with a single Routing Engine using the CLI:

1. Download the software package as described in "Downloading Software Packages from Juniper Networks" on page 69.
2. (Optional) Back up the current software configuration to a second storage option. See the *Junos OS Installation and Upgrade Guide* at http://www.juniper.net/techpubs/software/junos/ for instructions on performing this task.
3. (Optional) Copy the software package to the switch. We recommend that you use FTP to copy the file to the **/var/tmp** directory.

   This step is optional because Junos OS can also be upgraded when the software image is stored at a remote location. These instructions describe the software upgrade process for both scenarios.
4. Install the new package on the switch:

   

   NOTE: A reboot, which will occur as part of the execution of the following command, is required to complete the software upgrade. If you want to reboot the switch at a later time, do not use the reboot option at this point of the procedure and enter the request system reboot command at a later time to reboot the switch.

   user@switch> **request system software add *source* reboot**

   Replace ***source*** with one of the following paths:

   - For a software package that is installed from a local directory on the switch—***/pathname/package-name-m.nZx-distribution*.tgz**.
   - For a software package that is downloaded and installed from a remote location:
     - **ftp://*hostname/pathname/package-name-m.nZx-distribution*.tgz**

- **http://*hostname/pathname/package-name-m.nZx-distribution*.tgz**

where *package-name-m.nZx-distribution*.tgz is, for example, **jinstall-ex-4200-10.2R1.8-domestic-signed.tgz**.

Include the optional **member** option to install the software package on only one member of a Virtual Chassis:

user@switch> **request system software add** *source* **member** *member-id* **reboot**

Other members of the Virtual Chassis are not affected. To install the software on all members of the Virtual Chassis, do not include the **member** option.

5. After the reboot has completed, log in and verify that the new version of the software is properly installed:

   user@switch> **show version**

Installing Software on a J-EX8200 Switch with Redundant Routing Engines (CLI Procedure)

For a J-EX8200 switch with redundant Routing Engines, you can minimize disrupting network operation during a Junos OS upgrade by upgrading the Routing Engines separately, starting with the backup Routing Engine.

To upgrade the software package on a J-EX8200 switch with one installed Routing Engine, see "Installing Software on a J-EX Series Switch with a Single Routing Engine (CLI Procedure)" on page 70.

Install the new Junos OS release on the backup Routing Engine while keeping the currently running software version on the master Routing Engine. After making sure that the new software version is running correctly on the backup Routing Engine, switch device control to the backup Routing Engine. Finally, install the new software on the new backup Routing Engine.

To upgrade the Junos OS on the switch, perform the following tasks:

1. Preparing the Switch for the Software Installation on page 72
2. Installing Software on the Backup Routing Engine on page 73
3. Installing Software on the Default Master Routing Engine on page 74
4. Returning Routing Control to the Default Master Routing Engine (Optional) on page 75

Preparing the Switch for the Software Installation

Perform the following steps before installing the software:

1. Log in to the master Routing Engine's console.

   For information on logging in to the Routing Engine through the console port, see "Connecting and Configuring a J-EX Series Switch (CLI Procedure)" on page 161.

2. Enter Junos OS CLI configuration mode:

   a. Start the CLI from the shell prompt:

      ```
      user@switch:RE% cli
      ```

      You will see:

      ```
      {master}
      user@switch>
      ```

   b. Enter configuration mode:

      ```
      user@switch> configure
      ```

      You will see:

      ```
      {master}[[edit]
      user@switch#
      ```

3. Disable GRES (graceful Routing Engine switchover):

   ```
   [edit]
   user@switch# deactivate chassis redundancy graceful-switchover
   ```

4. Save the configuration change on both Routing Engines:

   ```
   [edit]
   user@switch# commit synchronize
   ```

   

   NOTE: To ensure the most recent configuration changes are committed before the software upgrade, perform this step even if GRES was previously disabled.

5. Exit out of the CLI configuration mode:

   ```
   [edit]
   user@switch# exit
   ```

6. (Optional) Back up the current software configuration to a second storage option. See the *Junos OS Installation and Upgrade Guide* at http://www.juniper.net/techpubs/software/junos/ for instructions on performing this task.

Installing Software on the Backup Routing Engine

Once the J-EX8200 switch is ready, you first install the software on the backup Routing Engine. This enables the master Routing Engine to continue operations, minimizing the disruption to your network.

1. Download the software by following the procedures in "Downloading Software Packages from Juniper Networks" on page 69.
2. Copy the software package to the switch. We recommend that you use FTP to copy the file to the **/var/tmp** directory.
3. Log in to the backup Routing Engine's console.
4. Install the new software package:

   user@switch> **request system software add validate**
   /var/tmp/*package-name-m.nZx-distribution*.tgz

   where *package-name-m.nZx-distribution*.tgz is, for example, **jinstall-ex-8200–10.2R1.5–domestic-signed.tgz**.

   For more information on the **request system software add** command, see the *Junos OS System Basics and Services Command Reference* at http://www.juniper.net/techpubs/software/junos/.

   

   NOTE: To abort the installation, do not reboot your device; instead, finish the installation and then issue the **request system software delete** *package-name-m.nZx-distribution*.tgz command, where *package-name-m.nZx-distribution*.tgz is, for example, **jinstall-ex-4200–10.2R1.5–domestic-signed.tgz**. This is your last chance to stop the installation.

5. Reboot to start the new software:

   user@switch> **request system reboot**
   Reboot the system? [yes, no] (no) **yes**

   

   NOTE: You must reboot the switch to load the new installation of Junos OS.

6. After the reboot has completed, log in and verify the new version of the software is properly installed:

   user@switch> **show version**

Installing Software on the Default Master Routing Engine

To switch device control to the backup Routing Engine and then upgrade or downgrade the master Routing Engine software:

1. Log in to the master Routing Engine console port.
2. Transfer device control to the backup Routing Engine:

   user@switch> **request chassis routing-engine master switch**

   

   NOTE: Because GRES is disabled, this switchover causes all line cards in the switch to reload. All network traffic passing through these line cards is lost during the line card reloads.

3. Verify that the default backup Routing Engine (shown as slot 1 in the command output) is now the master Routing Engine:

   user@switch> **show chassis routing-engine**

   You will see:

   ```
   Routing Engine status:
    Slot 0:
      Current state          Backup
      Election priority      Master (default)
   Routing Engine status:
    Slot 1:
      Current state          Master
      Election priority      Backup (default)
   ```

4. Install the new software package using the **request system software add** command:

   user@switch> **request system software add validate**
   /var/tmp/jinstall-ex-8200-10.2R1.5-domestic-signed.tgz

5. Reboot the Routing Engine:

   user@switch> **request system reboot**
   Reboot the system? [yes, no] (no) **yes**

   When the reboot completes, the prompt will reappear. Wait for this prompt to reappear before proceeding to the next step.

6. Log in to the default backup Routing Engine (slot 1) through the console port.
7. Re-enable GRES:

   [edit]
   user@switch# **activate chassis redundancy graceful-switchover**

   Re-enabling GRES allows any future Routing Engine switchovers to occur without the loss of any network traffic.

8. Enter the **commit synchronize** command to save the configuration change:

   [edit]

```
user@switch# commit synchronize
```

9. Log in and verify the version of the software installed.

   If you want to return routing control to the Routing Engine that was the master Routing Engine at the beginning of the procedure (the default master Routing Engine), perform the next task.

Returning Routing Control to the Default Master Routing Engine (Optional)

The switch can maintain normal operations with the Routing Engine in slot 1 acting as the master Routing Engine after the software upgrade, so only perform this task if you want to return routing control to the default master Routing Engine in slot 0.

1. Transfer routing control back to the default master Routing Engine:

   ```
   user@switch> request chassis routing-engine master switch
   ```

2. Verify that the default master Routing Engine (slot 0) is indeed the master Routing Engine:

   ```
   user@switch> show chassis routing-engine
   ```

   You will see:

   ```
   Routing Engine status:
    Slot 0:
      Current state          Master
      Election priority      Master (default)
   Routing Engine status:
    Slot 1:
      Current state          Backup
      Election priority      Backup (default)
   ```

Installing Software on J-EX Series Switches (J-Web Procedure)

You can upgrade software packages on a single fixed-configuration switch, on an individual member of a Virtual Chassis, or for all members of a Virtual Chassis.

You can use the J-Web interface to install software upgrades from a server using FTP or HTTP, or by copying the file to the J-EX Series switch.

NOTE:
To access the J-Web interface, your management device must have the following software installed:

- Operating system: Microsoft Windows XP Service Pack 3
- Browser version: One of the following. Other browsers might work but are not supported by J-Series platforms.
  - Microsoft Internet Explorer version 7.0
  - Mozilla Firefox version 3.0
- Additional requirements:
  - Only English-language browsers are supported.
  - The browser and the network must be able to receive and process HTTP/1.1 gzip compressed data.

This topic describes:

Installing Software Upgrades from a Server

To install software upgrades from a remote server by using FTP or HTTP:

1. Download the software package as described in "Downloading Software Packages from Juniper Networks" on page 69.
2. Log in to the Juniper Networks authentication system using the username (generally your e-mail address) and password supplied by Juniper Networks representatives.
3. In the J-Web interface, select **Maintain>Software>Install Package**.
4. On the Install Remote page, enter information into the fields described in Table 22 on page 76.
5. Click **Fetch and Install Package**. The software is activated after the switch has rebooted.

Table 22: Install Remote Summary

Field	Function	Your Action
Package Location (required)	Specifies the FTP or HTTP server, file path, and software package name.	Type the full address of the software package location on the FTP or HTTP server—one of the following: ftp://*hostname/pathname/package-name* http://*hostname/pathname/package-name*

Table 22: Install Remote Summary *(continued)*

Field	Function	Your Action
User	Specifies the username, if the server requires one.	Type the username.
Password	Specifies the password, if the server requires one.	Type the password.
Reboot If Required	If this box is checked, the switching platform is automatically rebooted when the upgrade is complete.	Check the box if you want the switching platform to reboot automatically when the upgrade is complete.

Installing Software Upgrades by Uploading Files

To install software upgrades by uploading files:

1. Download the software package.
2. In the J-Web interface, select **Maintain>Software>Upload Package**.
3. On the Upload Package page, enter information into the fields described in Table 23 on page 77.
4. Click **Upload and Install Package**. The software is activated after the switching platform has rebooted.

Table 23: Upload Package Summary

Field	Function	Your Action
File to Upload (required)	Specifies the location of the software package.	Type the location of the software package, or click **Browse** to navigate to the location.
Reboot If Required	Specifies that the switching platform is automatically rebooted when the upgrade is complete.	Select the check box if you want the switching platform to reboot automatically when the upgrade is complete.

Related Documentation

Rebooting or Halting the J-EX Series Switch (J-Web Procedure)

You can use the J-Web interface to schedule a reboot or to halt the switching platform.

To reboot or halt the switching platform by using the J-Web interface:

1. In the J-Web interface, select **Maintain>Reboot**.
2. Select one:
   - **Reboot Immediately**—Reboots the switching platform immediately.
   - **Reboot in *number of* minutes**—Reboots the switch in the number of minutes from now that you specify.
   - **Reboot when the system time is *hour:minute*** —Reboots the switch at the absolute time that you specify, on the current day. You must select a 2-digit hour in 24-hour format and a 2-digit minute.
   - **Halt Immediately**— Stops the switching platform software immediately. After the switching platform software has stopped, you can access the switching platform through the console port only.
3. (Optional) In the Message box, type a message to be displayed to any users on the switching platform before the reboot occurs.
4. Click **Schedule**. The J-Web interface requests confirmation to perform the reboot or halt.
5. Click **OK** to confirm the operation.
   - If the reboot is scheduled to occur immediately, the switch reboots. You cannot access the J-Web interface until the switch has restarted and the boot sequence is complete. After the reboot is complete, refresh the browser window to display the J-Web interface login page.
   - If the reboot is scheduled to occur in the future, the Reboot page displays the time until reboot. You have the option to cancel the request by clicking **Cancel Reboot** on the J-Web interface Reboot page.
   - If the switch is halted, all software processes stop and you can access the switching platform through the console port only. Reboot the switch by pressing any key on the keyboard.

CHAPTER 6

Booting the Switch, Upgrading Software, and Managing Licenses

Booting the Switch

Booting a J-EX Series Switch Using a Software Package Stored on a USB Flash Drive

There are two methods of getting Junos OS onto a USB flash drive before using the software to boot the switch. You can pre-install the software onto the USB flash drive before inserting the USB flash drive into the USB port, or you can use the system snapshot feature to copy files from internal switch memory to the USB flash drive.

To move files into USB flash memory using a system snapshot and use those files to boot the switch, see “Creating a Snapshot and Using It to Boot a J-EX Series Switch” on page 80. We recommend that you use this method to boot the switch from a USB flash drive if your switch is running properly.

If you need to pre-install the software onto the USB flash drive, you can use the method described in this topic. Pre-installing Junos OS onto a USB flash drive to boot the switch can be done at any time and is particularly useful when the switch boots to the loader prompt because the switch cannot locate Junos OS in internal flash memory.

Ensure that you have the following tools and parts available to boot the switch from a USB flash drive:

- A USB flash drive that meets the J-EX Series switch USB port specifications. See USB Port Specifications for a J-EX Series Switch.
- A computer or other device that you can use to download the software package from the Internet and copy it to the USB flash drive.

To download a Junos OS package onto a USB flash drive before inserting the USB flash drive:

1. Download the Junos OS package that you would like to place onto the J-EX Series switch from the Internet onto the USB flash drive using your computer or other device. See "Downloading Software Packages from Juniper Networks" on page 69.
2. Remove the USB flash drive from the computer or other device.
3. Insert the USB flash drive into the USB port on the switch.
4. This step can only be performed when the prompt for the loader script (**loader>**) is displayed. The loader script starts when Junos OS loads but the CLI is not working for any reason or if the switch has no software installed.

   Install the software package onto the switch:

   loader> **install** ***source***

   where ***source*** represents the name and location of the Junos OS package on the USB flash drive. The Junos OS package on a flash drive is commonly stored in the root drive as the only file—for example, **file:///jinstall-ex-4200-10.2R1.5-domestic-signed.tgz**.

Creating a Snapshot and Using It to Boot a J-EX Series Switch

The system snapshot feature takes a "snapshot" of the files currently used to run the J-EX Series switch—the complete contents of the **/config** and **/var** directories, which include the running Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use these snapshots to boot the switch at the next bootup or as a backup boot option.

This topic includes the following tasks:

1. Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 80
2. Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 81

Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch

A snapshot can be created on USB flash memory after a switch is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB Flash drive:

- A USB flash drive that meets the J-EX Series switch USB port specifications. See USB Port Specifications for a J-EX Series Switch.

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:

   user@switch> **request system snapshot partition media external slice 1**

   NOTE: This example uses the partition option. If you have already created a partition for the snapshot, you don't need to use the partition option.

2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the USB flash drive. If you created the snapshot as a backup, do not perform this step.

   - To reboot the switch using the most recently created snapshot:

     user@switch> **request system reboot media external**

   - To reboot the switch using a snapshot in a specific partition on the USB flash drive:

     user@switch> **request system reboot media external slice 1**

Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch

A snapshot can be created on internal memory after a switch is booted using files stored in external memory.

To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:

   user@switch> **request system snapshot parition media internal slice 1**

   NOTE: This example uses the partition option. If you have already created a partition for the snapshot, you don't need to use the partition option.

2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.

   - To reboot the switch using the most recently created snapshot:

     user@switch> **request system reboot media internal**

   - To reboot the switch using a snapshot in a specific partition in internal memory:

     user@switch> **request system reboot media internal slice 1**

Upgrading Software

- Upgrading Software Using Automatic Software Download on J-EX Series Switches on page 82

Upgrading Software Using Automatic Software Download on J-EX Series Switches

The automatic software download feature uses the DHCP message exchange process to download and install software packages. You configure the automatic software download feature on J-EX Series switches acting as DHCP clients. You must enable automatic software download on the J-EX Series switch before the software upgrade can occur.

You configure a path to a software package file on the DHCP server. The server communicates the path to the software package file through DHCP server messages.

If you enable automatic software download, the DHCP client J-EX Series switch compares the software package name in the DHCP server message to the name of the software package that booted the switch. If the software packages are different, the DHCP client J-EX Series switch downloads and installs the software package specified in the DHCP server message.

Before you upgrade software using automatic software download, ensure that you have configured DHCP services for the switch, including configuring a path to a boot server and a boot file. See the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/ for information about using the CLI to configure DHCP services and settings. See “Configuring DHCP Services (J-Web Procedure)” on page 447 for information about using the J-Web interface to configure DHCP services and settings.

To enable automatic software download on a J-EX Series switch acting as a DHCP client:

```
[edit chassis]
user@switch# set auto-image-upgrade
```

Once automatic software download is enabled on your DHCP client J-EX Series switch and once DHCP services are enabled on your network, an automatic software download can occur at any time as part of the DHCP message exchange process.

If an automatic software download occurs, you see the following message on the switch:

```
Auto-image upgrade started
On successful installation system will reboot automatically
```

The switch reboots automatically to complete the upgrade.

Managing Licenses

Managing Licenses for the J-EX Series Switch (CLI Procedure)

To enable and use some Junos OS features on a J-EX Series switch, you must purchase, install, and manage separate software licenses. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy. After you have configured the features, you see a warning message if the switch does not have a license for the feature.

Before you begin managing licenses, be sure that you have:

- Obtained the needed licenses. For information about how to purchase software licenses, contact Dell.
- Understand what makes up a license key. For more information, see “License Key Components for the J-EX Series Switch” on page 66.

This topic includes the following tasks:

Adding New Licenses

To add one or more new license keys on the switch, with the CLI:

1. Add the license key or keys:
   - To add one or more license keys from a file or URL, specify the filename of the file or the URL where the key is located:

     ```
     user@switch> request system license add filename | url
     ```

   - To add a license key from the terminal:

     ```
     user@switch> request system license add terminal
     ```

2. When prompted, enter the license key, separating multiple license keys with a blank line.

   If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit the license entry mode.

Deleting Licenses

To delete one or more license keys from the switch with the CLI, specify the license ID:

```
user@switch> request system license delete license-id
```

You can delete only one license at a time.

Saving License Keys

To save the installed license keys to a file (which can be a URL) or to the terminal:

```
user@switch> request system license save filename | url
```

For example, the following command saves the installed license keys to a file named **license.conf**:

```
user@switch> request system license save ftp://user@switch/license.conf
```

Related Documentation

Managing Licenses for the J-EX Series Switch (J-Web Procedure)

To enable and use some Junos OS features on a J-EX Series switch, you must purchase, install, and manage separate software licenses. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy. After you have configured the features, you see a warning message if the switch does not have a license for the feature.

Before you begin managing licenses, be sure that you have:

- Obtained the needed licenses. For information about how to purchase software licenses, contact Dell.
- Understand what makes up a license key. For more information, see “License Key Components for the J-EX Series Switch” on page 66.

NOTE:
To access the J-Web interface, your management device must have the following software installed:

- Operating system: Microsoft Windows XP Service Pack 3
- Browser version: One of the following. Other browsers might work but are not supported by J-Series platforms.
  - Microsoft Internet Explorer version 7.0
  - Mozilla Firefox version 3.0
- Additional requirements:
  - Only English-language browsers are supported.
  - The browser and the network must be able to receive and process HTTP/1.1 gzip compressed data.

This topic includes the following tasks:

Adding New Licenses

To add one or more new license keys on the switch, with the J-Web license manager:

1. In the J-Web interface, select **Maintain>Licenses**.
2. Under Installed Licenses, click **Add** to add a new license key or keys.
3. Do *one* of the following, using a blank line to separate multiple license keys:
   - In the License File URL box, type the full URL to the destination file containing the license key or keys to be added.
   - In the License Key Text box, paste the license key text, in plain-text format, for the license to be added.
4. Click **OK** to add the license key or keys.

A list of features that use the license key is displayed. The table also lists the ID, state, and version of the license key.

Deleting Licenses

To delete one or more license keys from a switch with the J-Web license manager:

1. In the J-Web interface, select **Maintain>Licenses**.
2. Select the check box of the license or licenses you want to delete.

3. Click **Delete**.

Displaying License Keys

To display the license keys installed on a switch with the J-Web license manager:

1. In the J-Web interface, select **Maintain>Licenses**.
2. Under Installed Licenses, click **Display Keys** to display all the license keys installed on the switch.

A screen displaying the license keys in text format appears. Multiple licenses are separated by a blank line.

Downloading Licenses

To download the license keys installed on the switch with the J-Web license manager:

1. In the J-Web interface, select **Maintain>Licenses**.
2. Under Installed Licenses, click **Download Keys** to download all the license keys installed on the switch to a single file.
3. Select **Save it to disk** and specify the file to which the license keys are to be written. You can also download the license file to your system.

CHAPTER 7

Verifying Software Installation

Routine Monitoring

Verifying That Automatic Software Download Is Working Correctly

Purpose Verify that the automatic software download feature is working correctly.

Action Use the **show system services dhcp client *interface-name*** command to verify that the automatic software download feature has been used to install a software package.

```
user@switch> show system services dhcp client ge-0/0/1.0
 Logical Interface Name       ge-0/0/1.0
  Hardware address        00:0a:12:00:12:12
  Client Status           bound
  Vendor Identifier       ether
  Server Address          10.1.1.1
  Address obtained        10.1.1.89
  Lease Obtained at       2009-08-20 18:13:04 PST
  Lease Expires at        2009-08-22 18:13:04 PST

DHCP Options :
  Name: name-server, Value: [ 10.209.194.131, 2.2.2.2, 3.3.3.3 ]
  Name: server-identifier, Value: 10.1.1.1
  Name: router, Value: [ 10.1.1.80 ]
  Name: boot-image,
  Value: jinstall-ex-4200-10.2R1.5-domestic-signed.tgz
  Name: boot-image-location,
  Value: 10.1.1.25:/bootfiles/
```

Meaning The output from this command shows the name and location of the software package under **DHCP options** when automatic software download was last used to install a software package. The sample output in **DHCP options** shows that the last DHCP server message to arrive on the DHCP client had a boot server address of **192.168.1.165** and a boot file named **jinstall-ex-4200-10.2R1.5-domestic-signed.tgz**. If automatic software

download was enabled on this client switch during the last DHCP message exchange, these values were used by the switch to upgrade the software.

Related Documentation

- Upgrading Software Using Automatic Software Download on J-EX Series Switches on page 82
- DHCP Services for J-EX Series Switches Overview on page 445

Verifying That a System Snapshot Was Created on a J-EX Series Switch

Purpose Verify that a system snapshot was created with the proper files on a J-EX Series switch.

Action View the snapshot:

```
user@switch> show system snapshot media external
Information for snapshot on external (da1s1)
Creation date: Oct 1320:23:23 2009
Junos version on snapshot:
jbase : 10.0I20090726_0011_user
jcrypto-ex: 10.0I20090726_0011_user
jdocs-ex: 10.0I20090726_0011_user
jkernel-ex: 10.0I20090726_0011_user
jroute-ex: 10.0I20090726_0011_user
jswitch-ex: 10.0I20090726_0011_user
jweb-ex: 10.0I20090726_0011_user
jpfe-ex42x: 10.0I20090726_0011_user
```

Meaning The output shows the date and time when the snapshot was created and the packages that are part of the snapshot. The date and time match the time when you created the snapshot.

You can compare the output of this command to the output of the **show system software** command to ensure that the snapshot contains the same packages as the software currently running the switch.

Related Documentation

- Creating a Snapshot and Using It to Boot a J-EX Series Switch on page 80

Monitoring Licenses

- Monitoring Licenses for the J-EX Series Switch on page 88

Monitoring Licenses for the J-EX Series Switch

To enable and use some Junos OS features on the J-EX Series switch, you must purchase, install, and manage the appropriate software licenses. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy.

To monitor your installed licenses, perform the following tasks:

- Displaying Installed Licenses and License Usage Details on page 89
- Displaying Installed License Keys on page 90

Displaying Installed Licenses and License Usage Details

Purpose Verify that the expected license is installed and active on the switch and fully covers the switch configuration.

Action From the CLI, enter the **show system license** command. (To display only the **License usage** list, enter the **show system license usage** command. To display only the **Licenses installed** output, enter **show system license installed**.)

```
user@switch> show system license
License usage:

                              Licenses     Licenses    Licenses    Expiry
  Feature name                     used    installed      needed
  bgp                                 1            1           0    permanent
  isis                                0            1           0    permanent
  ospf3                               0            1           0    permanent
  ripng                               0            1           0    permanent
  mpls                                0            1           0    permanent

Licenses installed:

  License identifier: JUNOS204558

  License version: 2

  Valid for device: BN0208380000

  Features:

    ex-series - Licensed routing protocols in ex-series

      permanent
```

Meaning The output shows the license or licenses (for Virtual Chassis deployments) installed on the switch and license usage. Verify the following information:

- If a feature that requires a license is configured (used), a license is installed on the switch. The **Licenses needed** column must show that no licenses are required.
- The appropriate number of licenses is installed. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy.
- The expected license is installed.

Displaying Installed License Keys

Purpose Verify that the expected license keys are installed on the switch.

Action From the CLI, enter the **show system license keys** command.

```
user@switch> show system license keys
JUNOS204558 aeaqea qmijhd amrqha ztfmbu gqzama uqceds

            ra32zr lsevik ftvjed o4jy5u fynzzj mgviyl

            kgioyf ardb5g sj7wnf rsdked wbjf5a sg
```

Meaning The output shows the license key or keys (for Virtual Chassis deployments) installed on the switch. Verify that each expected license key is present.

CHAPTER 8

Troubleshooting Software Installation

Troubleshooting Software Installation

Recovering from a Failed Software Upgrade on a J-EX Series Switch

Problem If Junos OS loads but the CLI is not working for any reason, or if the switch has no software installed, you can use this recovery installation procedure to install Junos OS.

Solution If there is already a Junos OS image on the system, you can install the new Junos OS package in a separate partition and both images will remain on the system, or you can wipe the disk clean before the new installation proceeds.

If there is no Junos OS image on the system, follow the instructions in "Booting a J-EX Series Switch Using a Software Package Stored on a USB Flash Drive" on page 79 to get an image on the system and boot the switch.

To perform a recovery installation:

1. Power on the switch. The loader script starts.

   After the message **Loading /boot/defaults/loader.conf** displays, you are prompted with:

   Hit [Enter] to boot immediately, or space bar for command prompt.

2. Press the space bar to enter the manual loader. The **loader>** prompt displays.

3. Enter the following command:

   loader> **install [– –format] [– –external]** ***source***

   where:

   - **format**—Use this option to wipe the installation media before installing the software package. If you do not include this option, the system installs the new Junos OS package in a different partition from that of the most recently installed Junos OS package.

- **external**—Use this option to install the software package onto an external media.
- **source**—Represents the name and location of the Junos OS package either on a server on the network or as a file on the USB flash drive:
  - Network address of the server and the path on the server; for example, **tftp://192.17.1.28/junos/jinstall-ex-4200-10.2R1.5-domestic-signed.tgz**
  - The Junos OS package on a USB device is commonly stored in the root drive as the only file; for example, **file:///jinstall-ex-4200-10.2R1.5-domestic-signed.tgz**

The boot process proceeds as normal and ends with a login prompt.

Rebooting from the Inactive Partition

Problem A J-EX Series switch ships with Junos OS loaded on the system disk in partition 1. The first time you upgrade, the new software package is installed in partition 2. When you finish the installation and reboot, partition 2 becomes the active partition. Similarly, subsequent software packages are installed in the inactive partition which becomes the active partition when you reboot at the end of the installation process.

If you performed an upgrade and rebooted, the system resets the active partition. You can use this procedure to manually boot from the inactive partition.

NOTE: If you have completed the installation of the software image but have not yet rebooted, you can issue the request system software rollback command to return to the original software installation package.

Solution Reboot from the inactive partition:

```
user@switch> request system reboot partition alternate
```

NOTE: If you cannot access the CLI, you can reboot from the inactive partition using the following procedure from the loader script prompt:

1. Unload and clear the interrupted boot from the active partition:

   ```
   loader> unload
   loader> unset vfs.root.mountfrom
   ```

2. Select the new (inactive) partition to boot from:

   ```
   loader> set currdev=disk media s partition:
   ```

   where *media* is either 0 (internal) or 1 (external) and *partition* indicates the partition number, either 1 or 2.

   You must include the colon (:) at the end of this command.

3. Boot Junos OS from the inactive partition:

   ```
   loader> boot
   ```

auto-image-upgrade

Syntax auto-image-upgrade;

Hierarchy Level [edit chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable automatic software download on a J-EX Series switch acting as a DHCP client.

The DHCP client J-EX Series switch compares the software package name in the DHCP server message to the name of the software package that booted the switch. If the software packages are different, the DHCP client J-EX Series switch downloads and installs the software package specified in the DHCP server message.

Before you upgrade software using automatic software download, ensure that you have configured DHCP services for the switch, including configuring a path to a boot server and a boot file. See the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/index.html for information about using the CLI to configure DHCP services and settings. See "Configuring DHCP Services (J-Web Procedure)" on page 447 for information about using the J-Web interface to configure DHCP services and settings.

Default Automatic software download is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

CHAPTER 10

Operational Mode Commands for Software Installation

request system license add

Syntax request system license add (*filename* | terminal)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Add a license key.

Options *filename*—License key from a file or URL. Specify the filename or the URL where the key is located.

terminal—License key from the terminal.

Required Privilege Level maintenance

List of Sample Output **request system license add on page 98**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system license add

```
user@host> request system license add terminal
```

request system license delete

Syntax request system license delete *license-id*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Delete a license key. You can delete only one license at a time.

Options *license-id*—License ID that uniquely identifies a license key.

Required Privilege Level maintenance

List of Sample Output **request system license delete on page 99**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system license delete

```
user@host> request system license delete G03000002223
```

request system license save

Syntax request system license save (*filename* | terminal)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Save installed license keys to a file or URL.

Options *filename*—License key from a file or URL. Specify the filename or the URL where the key is located.

terminal—License key from the terminal.

Required Privilege Level maintenance

List of Sample Output **request system license save on page 100**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system license save

```
user@host> request system license save ftp://user@host/license.conf
```

request system reboot

Syntax

request system reboot

<message "*text*">
<other-routing-engine>
<slice *slice*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Reboot the software.

Options

none—Reboot the software immediately.

all-members—(J-EX4200 switches only) (Optional) Reboot all members of the Virtual Chassis configuration.

at *time*—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **now**—Stop or reboot the software immediately. This is the default.
- ***+minutes***—Number of minutes from now to reboot the software.
- ***yymmddhhmm***—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to stop the software, specified in 24-hour time.

in *minutes*—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at *+minutes*** option.

local—(J-EX4200 switches only) (Optional) Reboot the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot.

media (external | internal)—(J-EX Series switches only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.
- **internal**—Reboot the internal flash device.

member *member-id*—(J-EX4200 switches only) (Optional) Reboot the specified member of the Virtual Chassis configuration Replace ***member-id*** with a value from 0 through 9.

message "*text*"—(Optional) Message to display to all system users before stopping or rebooting the software.

other-routing-engine—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

slice *slice*—(J-EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information

Reboot requests are recorded in the system log files, which you can view with the **show log** command (see **show log**). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see **show system processes**).

NOTE: To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

List of Sample Output

request system reboot on page 102
request system reboot (at 2300) on page 102
request system reboot (in 2 Hours) on page 103
request system reboot (Immediately) on page 103
request system reboot (at 1:20 AM) on page 103

Output Fields

When you enter this command, you are provided feedback on the status of your request.

request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
```

```
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

request system reboot (Immediately)

```
user@host> request system reboot at now
```

request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

request system reboot

Syntax

request system reboot
<all-members | local | member *member-id*>
<at *time*>
<in *minutes*>
<media (external | internal)>
<message "*text*">
<slice (1 | 2 | alternate)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Reboot Junos OS.

Reboot requests are recorded in the system log files, which you can view with the **show log** command. You can view the process names with the **show system processes** command.

Options

none—Reboots the software immediately.

all-members | **local** | **member** ***member-id***—(J-EX4200 switch only) (Optional) Specify which member of the Virtual Chassis to reboot:

- **all-members**—Reboots each switch that is a member of the Virtual Chassis.
- **local**—Reboots the local switch, meaning the switch you are logged into, only.
- **member** ***member-id***—Reboots the specified member switch of the Virtual Chassis.

at *time*—(Optional) Time at which to reboot the software, specified in one of the following ways:

- ***+minutes***—Number of minutes from now to reboot the software.
- ***hh:mm***—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- ***yymmddhhmm***—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

in *minutes*—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at** ***+minutes*** option.

media (external | internal)—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

message "*text*"—(Optional) Message to display to all system users before rebooting the software.

slice (1 | 2 | alternate)—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

Required Privilege Level maintenance

request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

request system reboot (in 2 Hours) The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

request system reboot (Immediately)

```
user@host> request system reboot at now
```

request system reboot (at 1:20 AM) To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

request system snapshot

Syntax

request system snapshot
<as-primary>
<all-members | local | member *member-id*>
<media (external | internal)>
<partition>
<re0 | re1 | routing-engine *routing-engine-id*>
<slice (1 | 2 | alternate)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Take a snapshot of the files currently used to run the switch—the complete contents of the **/config** and **/var** directories, which include the running Junos OS, the active configuration, and the rescue configuration—and copy all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source.

Options

none—Create a snapshot on the alternate media, meaning the external media if you booted the switch using software stored on internal media or internal media if you booted the switch using software stored on external media.

all-members | **local** | **member** *member-id*—(J-EX4200 switch only) (Optional) Specify where to place the snapshot in Virtual Chassis configurations:

- **all-members**—Create a snapshot for each switch that is a member of the Virtual Chassis.
- **local**—Create a snapshot on the local switch only.
- **member** *member-id*—Create a snapshot for the specified member or member switches of the Virtual Chassis.

as-primary—(Optional) Create a bootable snapshot.

NOTE: The snapshot is always bootable on J-EX Series switches. The as-primary option has no effect on snapshots on J-EX Series switches.

media (**external** | **internal**)—(Optional) Specify the destination media location for the snapshot. The **external** option copies the snapshot to an external mass storage device, such as a USB flash drive. The **internal** option copies the snapshot to an internal memory source, such as internal flash memory.

partition—(Optional) Partition the destination media before copying over the snapshot.

re0 | **re1** | **routing-engine** ***routing-engine-id***—(J-EX8200 switch only) Specify where to place the snapshot in dual Routing Engine configurations.

- **re0**—Create a snapshot on Routing Engine 0.
- **re1**—Create a snapshot on Routing Engine 1.

- **routing-engine***routing-engine-id*—Create a snapshot on the specified Routing Engine.

slice (**1** | **2** | **alternate**)—(Optional) Specify the destination partition for the snapshot:

- **1**—Copy the snapshot to partition 1.
- **2**—Copy the snapshot to partition 2.
- **alternate**—Copy the snapshot to the alternate partition, which is the partition that did not boot the switch at the last bootup.

Required Privilege Level view

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system snapshot media external slice 1

```
user@switch> request system snapshot media external slice 1
```

request system software add

Syntax request system software add *package-name*
<best-effort-load>
<delay-restart>
<force>
<no-copy>
<no-validate>
<re0 | re1>
<reboot>
<unlink>
<validate>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Install a software package or bundle on the router or switch.

Options *package-name*—Location from which the software package or bundle is to be installed. For example:

- **/var/tmp/*package-name***—For a software package or bundle that is being installed from a local directory on the router or switch.
- ***protocol*://*hostname*/*pathname*/*package-name***—For a software package or bundle that is to be downloaded and installed from a remote location. Replace ***protocol*** with one of the following:
  - **ftp**—File Transfer Protocol.
    Use **ftp://*hostname*/*pathname*/*package-name***. To specify authentication credentials, use **ftp://<*username*>:<*password*>@*hostname*/*pathname*/*package-name***. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.
    Use **http://*hostname*/*pathname*/*package-name***. To specify authentication credentials, use **http://<*username*>:<*password*>@*hostname*/*pathname*/*package-name***. If a password is required and you omit it, you are prompted for it.
  - **scp**—Secure copy (available only for Canada and U.S. version).
    Use **scp://*hostname*/*pathname*/*package-name***. To specify authentication credentials, use **scp://<*username*>:<*password*>@*hostname*/*pathname*/*package-name***.

NOTE: The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.

best-effort-load—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

delay-restart—(Optional) Install software package or bundle, but do not restart software processes.

force—(Optional) Force the addition of the software package or bundle (ignore warnings).

no-copy—(Optional) Install a software package or bundle, but do not save copies of package or bundle files.

no-validate—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

re0 | re1—(Optional) On routers that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (**re0**) or Routing Engine in slot 1 (**re1**).

reboot—(Optional) After adding the software package or bundle, reboot the system.

unlink—(Optional) Remove the software package from this directory after a successful upgrade is completed.

validate—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

Additional Information

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.

After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, **jkernel**, last. Add the operating system package, **jkernel**, first and the routing software package, **jroute**, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernel
user@host> request system software add /var/tmp/jpfe
user@host> request system software add /var/tmp/jdocs
user@host> request system software add /var/tmp/jroute
user@host> request system software add /var/tmp/jcrypto
```

request system software delete

Syntax request system software delete *software-package*
<force>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Remove a software package or bundle from the router or switch.

CAUTION: Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.

Options *software-package*—Software package or bundle name. You can delete any or all of the following software bundles or packages:

- **jbase**—(Optional) Junos OS base software suite
- **jcrypto**—(Optional, in domestic version only) Junos OS security software
- **jdocs**—(Optional) Junos OS online documentation file
- **jkernel**—(Optional) Junos OS kernel software suite
- **jpfe**—(Optional) Junos OS Packet Forwarding Engine support
- **jroute**—(Optional) Junos OS routing software suite
- **junos**—(Optional) Junos OS base software

force—(Optional) Ignore warnings and force removal of the software.

Additional Information Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems. After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

request system software rollback

Syntax

request system software rollback

Syntax (J-EX Series Switch)

request system software rollback
<all-members>
<local>
<member *member-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Revert to the software that was loaded at the last successful **request system software add** command.

Options

none—Revert to the set of software as of the last successful **request system software add**.

all-members—(J-EX4200 switches only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

local—(J-EX4200 switches only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Additional Information

Use this command only to recover from a failed software upgrade—you cannot issue this command to return to the previously installed software after using a **jinstall** package. To return to the previously installed software, use the corresponding **jinstall** package.

A software rollback fails if any required package (or a **jbundle** package containing the required package) cannot be found in **/var/sw/pkg**.

show system autoinstallation status

Syntax show system autoinstallation status

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display autoinstallation status information.

Options This command has no options.

Required Privilege Level view

List of Sample Output **show system autoinstallation status on page 117**

show system autoinstallation status

```
user@host> show system autoinstallation status
Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 0.0.0.0
Interface:
  Name: fe-0/0/1
  State: None
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
```

show system boot-messages

Syntax show system boot-messages

Syntax (J-EX Series Switch)
show system boot-messages
<all-members>
<local>
<member *member-id*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display initial messages generated by the system kernel upon startup. These messages are the contents of **/var/run/dmesg.boot**.

Options none—Display all boot time messages.

all-members—(J-EX4200 switches only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.

local—(J-EX4200 switches only) (Optional) Display boot time messages on the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Required Privilege Level view

show system license

Syntax show system license
<installed | keys | usage>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display licenses and information about how they are used.

Options none—Display all license information.

installed—(Optional) Display installed licenses only.

keys—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.

usage—(Optional) Display the state of licensed features.

Required Privilege Level maintenance

List of Sample Output
show system license on page 120
show system license installed on page 120
show system license keys on page 120
show system license usage on page 120

Output Fields Table 24 on page 119 lists the output fields for the **show system license** command. Output fields are listed in the approximate order in which they appear.

Table 24: show system license Output Fields

Field Name	Field Description
Feature name	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
Licenses used	Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.
Licenses installed	Information about the installed license key: • **License identifier**—Identifier associated with a license key. • **State**—State of the license key:**valid** or **invalid**. An **invalid** state indicates that the key was entered incorrectly or is not valid for the specific device. • **License version**—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key. • **Valid for device**—Device that can use a license key. • **Group defined**—Group membership of a device. • **Features**—Feature associated with a license, such as data link switching (DLSw).
Licenses needed	Number of licenses required for features being used but not yet properly licensed.

Table 24: show system license Output Fields *(continued)*

Field Name	Field Description
Expiry	Amount of time left within the grace period before a license is required for a feature being used.

show system license

```
user@host> show system license

License usage:
                                Licenses     Licenses    Licenses    Expiry
  Feature name                       used    installed      needed

show system snapshot

Syntax

show system snapshot
<all-members | local | member *member-id*>
<media (external | internal)>
<slice (1 | 2 | alternate)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the complete collection of files in a snapshot.

Options

none—Display the system snapshot on the alternate media, which is the media that does not have the software packages that last booted the switch.

all-members | local | member *member-id*—(J-EX4200 switch only) Display the snapshot in a Virtual Chassis configuration:

- **all-members**—Display the snapshot for each switch that is a member of the Virtual Chassis.
- **local**—Display the snapshot on the switch that you are currently logged into.
- **member *member-id***—Display the snapshot for the specified member switch of the Virtual Chassis.

media (external | internal)—(Optional) Display the destination media location for the snapshot. The **external** option specifies the snapshot on an external mass storage device, such as a USB flash drive. The **internal** option specifies the snapshot on an internal memory source, such as internal flash memory.

slice (1 | 2 | alternate)—Display the snapshot in a partition:

- **1**—Display the snapshot in partition 1.
- **2**—Display the snapshot in partition 2.
- **alternate**—Display the snapshot in the alternate partition, which is the partition that did not boot the switch at the last bootup.

PART 4

User Interfaces

CHAPTER 11

User Interfaces Overview

User Interfaces—Overview

CLI User Interface Overview

You can use two interfaces to monitor, configure, troubleshoot, and manage a J-EX Series Switch: the J-Web graphical user interface and the Junos OS command-line interface (CLI). Both of these user interfaces are shipped with the switch. This topic describes the CLI. For information about the J-Web user interface, see "J-Web User Interface for J-EX Series Switches Overview" on page 129.

CLI Overview

Junos OS CLI is a command shell that runs on top of a UNIX-based operating system kernel. The CLI provides command help and command completion.

The CLI also provides a variety of UNIX utilities, such as Emacs-style keyboard sequences that allow you to move around on a command line and scroll through recently executed commands, regular expression matching to locate and replace values and identifiers in a configuration, filter command output, or log file entries, store and archive router files on a UNIX-based file system, and exit from the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage switch processes, and so on.

CLI Help and Command Completion

To access CLI Help, type a question mark (**?**) at any level of the hierarchy. The system displays a list of the available commands or statements and a short description of each.

To complete a command, statement, or option that you have partially typed, press the Tab key or the Spacebar. If the partially typed letters uniquely identify a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command and the possible completions are displayed. This completion feature also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

CLI Command Modes

The CLI has two modes, operational mode and configuration mode.

In operational mode, you enter commands to monitor and troubleshoot switch hardware and software and network connectivity. Operational mode is indicated by the > prompt—for example, **user@switch>**.

In configuration mode, you can define all properties of Junos OS, including interfaces, VLANs, Virtual Chassis information, routing protocols, user access, and several system hardware properties.

To enter configuration mode, enter the **configure** command: .

```
user@switch> configure
```

Configuration mode is indicated by the **#** prompt, and includes the current location in the configuration hierarchy—for example:

```
[edit interfaces ge-0/0/12]
user@switch#
```

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration, the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the **commit** command.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

```
[edit interfaces ge-0/0/12]
user@switch# top
[edit]
user@switch# exit
```

You can also activate your configuration changes and exit configuration mode with a single command, **commit and-quit**. This command succeeds only if there are no mistakes or syntax errors in the configuration.

TIP: When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the commit

confirmed command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the commit confirmed command, you must issue another commit command within the defined period of time (10 minutes by default) or the system reverts to the previous configuration.

J-Web User Interface for J-EX Series Switches Overview

You can use two interfaces to monitor, configure, troubleshoot, and manage a J-EX Series Switch: the J-Web graphical user interface and the Junos OS command-line interface (CLI). Both of these user interfaces are shipped with the switch. This topic describes the J-Web interface. You can navigate the J-Web interface, scroll pages, and expand and collapse elements as you do in a typical Web browser interface. For information about the CLI user interface, see "CLI User Interface Overview" on page 127.

NOTE:

To access the J-Web interface, your management device must have the following software installed:

- Operating system: Microsoft Windows XP Service Pack 3
- Browser version: One of the following. Other browsers might work but are not supported by J-Series platforms.
  - Microsoft Internet Explorer version 7.0
  - Mozilla Firefox version 3.0
- Additional requirements:
  - Only English-language browsers are supported.
  - The browser and the network must be able to receive and process HTTP/1.1 gzip compressed data.

Each page of the J-Web interface is divided into panes.

- Top pane—Displays system identity information and links.
- Main pane—Location where you monitor, configure, diagnose (troubleshoot), and manage (maintain) the switch by entering information in text boxes, making selections, and clicking buttons.
- Side pane—Displays suboptions of the Monitor, Configure, Troubleshoot, or Maintain task currently displayed in the main pane. Click a suboption to access it in the main pane.

The layout of the panes allows you to quickly navigate through the interface. Table 25 on page 130 summarizes the elements of the J-Web interface.

The J-Web interface provides CLI tools that allow you to perform all of the tasks that you can perform from the Junos OS command-line interface (CLI), including a CLI Viewer to view the current configuration, a CLI Editor for viewing and modifying the configuration, and a Point & Click CLI editor that allows you to click through all of the available CLI statements.

Table 25: J-Web Interface

J-Web Interface Element	Description
Top Pane	
Host	The hostname of the switch.
Logged in as: username	The user name you used to log in to the switch.

Commit Options	A set of options using which you can configure committing multiple changes with a single commit.
	• Commit—Commits the candidate configuration of the current user session, along with changes from other user sessions.
	• Compare—Displays the XML log of pending configurations on the device.
	• Discard—Discards the candidate configuration of the current user session, along with changes from other user sessions.
	• Preference—Indicates your choice of committing all configurations changes together or committing each configuration change immediately. The two commit options are:
	  ◦ **Commit changes immediately**—Sets the system to force an immediate commit on every page after every configuration change.
	  ◦ **Validate changes until explicit commit**—Loads all configuration changes for an accumulated single commit. If there are errors in loading the configuration, the errors are logged. This is the default mode.
	NOTE: There are some pages on which configuration changes must be committed immediately. For such pages, if you configure the commit options for a single commit, the system displays warning notifications that remind you to commit your changes immediately. An example for such a page is **Switching**.

Help	Displays links to information on help and the J-Web interface. • Help Contents—View context-sensitive help topics. • About—Displays information about the J-Web interface, such as the version number.
Logout	Ends your current login session with the switch and returns you to the login page.

Table 25: J-Web Interface *(continued)*

J-Web Interface Element	Description
Taskbar	Menu of J-Web main options. Click the tab to access an option. • Dashboard—Displays a high-level, graphical view of the chassis and status of the switch. It displays system health information, alarms, and system status. • Configure—Configure the switch, and view configuration history. • Monitor—View information about configuration and hardware on the switch. • Maintain—Manage files and licenses, upgrade software, and reboot the switch. • Troubleshoot—Run diagnostic tools to troubleshoot network issues.
Main Pane	
Help (?) icon	Displays useful information—such as the definition, format, and valid range of an option—when you move the cursor over the question mark.
Red asterisk (*)	Indicates a required field.
Icon legend	(Applies to the Point & Click CLI editor only) Explains icons that appear in the user interface to provide information about configuration statements: • C—Comment. Move your cursor over the icon to view a comment about the configuration statement. • I—Inactive. The configuration statement does not affect the switch. • M—Modified. The configuration statement has been added or modified. • *—Mandatory. The configuration statement must have a value.
Task Pane	
Configuration hierarchy	(Applies to the Junos OS CLI configuration editor only) Displays the hierarchy of committed statements in the switch configuration. • Click **Expand all** to display the entire hierarchy. • Click **Hide all** to display only the statements at the top level. • Click plus signs (+) to expand individual items. • Click minus signs (-) to hide individual items.

Understanding J-Web Configuration Tools

The J-Web graphical user interface (GUI) allows you to monitor, configure, troubleshoot, and manage the switching platform by means of a Web browser with Hypertext Transfer

Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS) enabled. The J-Web interface provides access to all the configuration statements supported by the switch, so you can fully configure the switch without using the CLI.

The J-Web interface provides three methods of configuring the switch:

- Configure menu
- Point & Click CLI Editor
- CLI Editor

Table 26 on page 132 gives a comparison of the three methods of configuration.

Table 26: Switching Platform Configuration Interfaces

Tool	Description	Function	Use
Configure menu	Web browser pages for setting up the switch quickly and easily without configuring each statement individually. For example, use the Virtual Chassis Configuration page to configure the Virtual Chassis parameters on the switch.	Configure basic switch platform services: • Interfaces • Switching • Virtual Chassis • Security • Services • System Properties • Routing	Use for basic configuration.
Point & Click CLI editor	Web browser pages divided into panes in which you can do any of the following: • Expand the entire configuration hierarchy and click a configuration statement to view or edit. The main pane displays all the options for the statement, with a text box for each option. • Paste a complete configuration hierarchy into a scrollable text box, or edit individual lines. • Upload or download a complete configuration. • Roll back to a previous configuration. • Create or delete a rescue configuration.	Configure all switching platform services: • System parameters • User Accounting and Access • Interfaces • VLAN properties • Virtual Chassis properties • Secure Access • Services • Routing protocols	Use for complete configuration if you are not familiar with the Junos OS CLI or prefer a graphical interface.
CLI editor	Interface in which you do any of the following: • Type commands on a line and press **Enter** to create a hierarchy of configuration statements. • Create an ASCII text file that contains the statement hierarchy. • Upload a complete configuration, or roll back to a previous configuration. • Create or delete a rescue configuration.	Configure all switching platform services: • System parameters • User Accounting and Access • Interfaces • VLAN properties • Virtual Chassis properties • Secure Access • Services • Routing protocols	Use for complete configuration if you know the Junos OS CLI or prefer a command interface.

Understanding J-Web User Interface Sessions

You establish a J-Web session with the switch through an HTTP-enabled or HTTPS-enabled Web browser. The HTTPS protocol, which uses 128-bit encryption, is available only in domestic versions of Junos OS. To use HTTPS, you must have installed a certificate on the switch and enabled HTTPS. See "Generating SSL Certificates to Be Used for Secure Web Access" on page 398.

When you attempt to log in through the J-Web interface, the switch authenticates your username with the same methods used for Telnet and SSH.

If the switch does not detect any activity through the J-Web interface for 15 minutes, the session times out and is terminated. You must log in again to begin a new session.

To explicitly terminate a J-Web session at any time, click **Logout** in the top pane.

CHAPTER 12

Using the Configuration Tools

Using the CLI Terminal

The J-Web CLI terminal provides access to the Junos OS command line interface (CLI) through the J-Web interface. The functionality and behavior of the CLI available through the CLI terminal page is the same as that of the Junos OS CLI available through the switch console. The CLI terminal supports all CLI commands and other features such as CLI help and autocompletion. Using the CLI terminal page you can fully configure, monitor, and manage the switch.

To access the J-Web interface, your management device must have the following software installed:

- Operating system: Microsoft Windows XP Service Pack 3
- Browser version: One of the following. Other browsers might work but are not supported by J-Series platforms.
  - Microsoft Internet Explorer version 7.0
  - Mozilla Firefox version 3.0
- Additional requirements:
  - Only English-language browsers are supported.
  - The browser and the network must be able to receive and process HTTP/1.1 gzip compressed data.
- Before you can use the CLI terminal, you must configure the domain name and hostname of the switch. See “Configuring System Identity for the J-EX Series Switch (J-Web Procedure)” on page 168 for more information.
- To access the CLI through the J-Web interface, your management device requires the following features:
  - SSH access—Enable Secure shell (SSH) on your system. SSH provides a secured method of logging in to the switch, to encrypt traffic so that it is not intercepted. If SSH is not enabled on the system, the CLI terminal page displays an error.

- Java applet support—Make sure that your Web browser supports Java applets.
- JRE installed on the client—Install Java Runtime Environment (JRE) version 1.4 or later on your system. JRE is a software package that must be installed on a system to run Java applications. Download the latest JRE version from the Java Software website **http://www.java.com/**. Installing JRE installs Java plug-ins, which once installed, load automatically and transparently to render Java applets.

NOTE: The CLI terminal is supported on JRE version 1.4 and later only.

To access the CLI terminal, select **Troubleshoot >CLI Terminal**.

Starting the J-Web Interface

You can use the J-Web graphical interface to configure and manage the J-EX Series switch.

To start the J-Web interface:

1. Launch your HTTP-enabled or HTTPS-enabled Web browser.

   To use HTTPS, you must have installed a certificate on the switch and enabled HTTPS.

2. After **http://** or **https://** in your Web browser, type the hostname or IP address of the switch and press **Enter**.

   The J-Web login page appears.

3. On the login page, type your username and password, and click **Log In**.

   To correct or change the username or password you typed, click **Reset**, type the new entry or entries, and click **Log In**.

   

   NOTE: The default username is root with no password. You must change this during initial configuration or the system does not accept the configuration.

   The Chassis Dashboard information page appears.

To explicitly terminate a J-Web session at any time, click **Logout** in the top pane.

CHAPTER 13

Operational Mode Commands for User Interfaces

set cli complete-on-space

Syntax set cli complete-on-space (off | on)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the command-line interface (CLI) to complete a partial command entry when you type a space or a tab. This is the default behavior of the CLI.

Options off—Turn off command completion.

on—Allow either a space or a tab to be used for command completion.

Required Privilege Level view

Related Documentation

- **show cli on page 147**

List of Sample Output **set cli complete-on-space on page 138**

Output Fields When you enter this command, you are provided feedback on the status of your request.

set cli complete-on-space In the following example, pressing the Spacebar changes the partial command entry from **com** to **complete-on-space**. The example shows how adding the keyword **off** at the end of the command disables command completion.

```
user@host> set cli com<Space>
user@host>set cli complete-on-space off
Disabling complete-on-space
```

set cli directory

Syntax set cli directory *directory*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the current working directory.

Options *directory*—Pathname of the working directory.

Required Privilege Level view

Related Documentation
- **show cli directory on page 152**

List of Sample Output **set cli directory on page 139**

Output Fields When you enter this command, you are provided feedback on the status of your request.

set cli directory

```
user@host> set cli directory /var/home/regress
Current directory: /var/home/regress
```

set cli idle-timeout

Syntax
set cli idle-timeout
<*minutes*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Set the maximum time that an individual session can be idle before the user is logged off the router or switch.

Options
minutes—(Optional) Maximum idle time. The range of values, in minutes, is 0 through 100,000. If you do not issue this command, and the user's login class does not specify this value, the user is never forced off the system after extended idle times. Setting the value to 0 disables the timeout.

Required Privilege Level
view

Related Documentation
- **show cli on page 147**

List of Sample Output
set cli idle-timeout on page 140

Output Fields
When you enter this command, you are provided feedback on the status of your request.

set cli idle-timeout

```
user@host> set cli idle-timeout 60
Idle timeout set to 60 minutes
```

set cli prompt

Syntax set cli prompt *string*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the prompt so that it is displayed within the CLI.

Options *string*—CLI prompt string. To include spaces in the prompt, enclose the string in quotation marks. By default, the string is ***username@hostname***.

Required Privilege Level view

Related Documentation
- **show cli on page 147**

List of Sample Output **set cli prompt on page 141**

Output Fields When you enter this command, the new CLI prompt is displayed.

set cli prompt

```
user@host> set cli prompt lab1-router>
lab1-router>
```

set cli restart-on-upgrade

Syntax set cli restart-on-upgrade string (off | on)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For an individual session, set the CLI to prompt you to restart the router or switch after upgrading the software.

Options off—Disables the prompt.

on—Enables the prompt.

Required Privilege Level view

Related Documentation
- **show cli on page 147**

List of Sample Output **set cli restart-on-upgrade on page 142**

Output Fields When you enter this command, you are provided feedback on the status of your request.

set cli restart-on-upgrade

```
user@host> set cli restart-on-upgrade on
Enabling restart-on-upgrade
```

set cli screen-length

Syntax set cli screen-length *length*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set terminal screen length.

Options *length*—Number of lines of text that the terminal screen displays. The range of values, in number of lines, is **24** through **100,000**. The default is **24**.

Additional Information The point at which the **---(more)---** prompt appears on the screen is a function of this setting and the settings for the **set cli screen-width** and **set cli terminal** commands.

Required Privilege Level view

Related Documentation

- **set cli screen-width on page 144**
- **set cli terminal on page 145**
- **show cli on page 147**

List of Sample Output **set cli screen-length on page 143**

Output Fields When you enter this command, you are provided feedback on the status of your request.

set cli screen-length

```
user@host> set cli screen-length 75
Screen length set to 75
```

set cli screen-width

Syntax set cli screen-width *width*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the terminal screen width.

Options *width*—Number of characters in a line. The range of values is **80** through **100,000**. The default is **80**.

Additional Information The point at which the **---(more)---** prompt appears on the screen is a function of this setting and the settings for the **set cli screen-length** and **set cli terminal** commands.

Required Privilege Level view

Related Documentation

- **set cli screen-length on page 143**
- **set cli terminal on page 145**
- **show cli on page 147**

List of Sample Output **set cli screen-width on page 144**

Output Fields When you enter this command, you are provided feedback on the status of your request.

set cli screen-width

```
user@host> set cli screen-width
Screen width set to 132
```

set cli terminal

Syntax set cli terminal *terminal-type*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the terminal type.

Options *terminal-type*—Type of terminal that is connected to the Ethernet management port:

- **ansi**—ANSI-compatible terminal (80 characters by 24 lines)
- **small-xterm**—Small xterm window (80 characters by 24 lines)
- **vt100**—VT100-compatible terminal (80 characters by 24 lines)
- **xterm**—Large xterm window (80 characters by 65 lines)

Required Privilege Level view

Related Documentation

- **show cli on page 147**

List of Sample Output **set cli terminal on page 145**

Output Fields This command provides no output.

set cli terminal

```
user@host> set cli terminal xterm
```

set cli timestamp

Syntax set cli timestamp (format *timestamp-format* | disable)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set a timestamp for CLI output.

Options format *timestamp-format*—Set the date and time format for the timestamp. The timestamp format you specify can include the following placeholders in any order:

- **%m**—Two-digit month
- **%d**—Two-digit date
- **%T**—Six-digit hour, minute, and seconds

disable—Remove the timestamp from the CLI.

Required Privilege Level view

Related Documentation

- **show cli on page 147**

List of Sample Output **set cli timestamp on page 146**

Output Fields When you enter this command, you are provided feedback on the status of your request.

set cli timestamp

```
user@host> set cli timestamp format '%m-%d-%T'
'04-21-17:39:13'
CLI timestamp set to: '%m-%d-%T'
```

show cli

Syntax show cli

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display configured CLI settings.

Options This command has no options.

Required Privilege Level view

List of Sample Output **show cli on page 147**

Output Fields Table 27 on page 147 lists the output fields for the **show cli** command. Output fields are listed in the approximate order in which they appear.

Table 27: show cli Output Fields

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: **on** or **off**.
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged off the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is **disabled**.
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: **on** or **off**.
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: **enhanced**.
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is **disabled**.
CLI working directory	Pathname of the working directory.

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/home/regress'
```

show cli authorization

Syntax show cli authorization

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the permissions for the current user.

Options This command has no options.

Required Privilege Level view

List of Sample Output **show cli authorization on page 150**

Output Fields Table 28 on page 149 lists the output fields for the **show cli authorization** command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.

Table 28: show cli authorization Output Fields

Field Name	Field Description
access	Can view access configuration information.
access-control	Can modify access configuration.
admin	Can view user account information.
admin-control	Can modify user account information.
clear	Can clear learned network information.
configure	Can enter configuration mode.
control	Can modify any configuration.
edit	Can edit configuration files.
field	Reserved for field (debugging) support.
firewall	Can view firewall configuration information.
firewall-control	Can modify firewall configuration information.
floppy	Can read from and write to removable media.
flow-tap	Can view flow-tap configuration information.
flow-tap-control	Can configure flow-tap configuration information.

Table 28: show cli authorization Output Fields *(continued)*

Field Name	Field Description
interface	Can view interface configuration information.
interface-control	Can modify interface configuration information.
maintenance	Can perform system maintenance.
network	Can access the network by entering the **ping**, **ssh**, **telnet**, and **traceroute** commands.
reset	Can reset or restart interfaces and system processes.
rollback	Can rollback to previous configurations.
routing	Can view routing configuration information.
routing-control	Can modify routing configuration information.
secret	Can view passwords and authentication keys in the configuration.
secret-control	Can modify passwords and authentication keys in the configuration.
security	Can view security configuration information.
security-control	Can modify security configuration information.
shell	Can start a local shell.
snmp	Can view SNMP configuration information.
snmp-control	Can modify SNMP configuration information.
system	Can view system configuration information.
system-control	Can modify system configuration information.
trace	Can view trace file settings information.
trace-control	Can modify trace file settings information.
view	Can view current values and statistics.
view-configuration	Can view all configuration information (not including secrets).

show cli authorization

```
user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
    admin       -- Can view user accounts
```

```
    admin-control-- Can modify user accounts
    clear       -- Can clear learned network information
    configure   -- Can enter configuration mode
    control     -- Can modify any configuration
    edit        -- Can edit full files
    field       -- Special for field (debug) support
    floppy      -- Can read and write from the floppy
    interface   -- Can view interface configuration
    interface-control-- Can modify interface configuration
    network     -- Can access the network
    reset       -- Can reset/restart interfaces and daemons
    routing     -- Can view routing configuration
    routing-control-- Can modify routing configuration
    shell       -- Can start a local shell
    snmp        -- Can view SNMP configuration
    snmp-control-- Can modify SNMP configuration
    system      -- Can view system configuration
    system-control-- Can modify system configuration
    trace       -- Can view trace file settings
    trace-control-- Can modify trace file settings
    view        -- Can view current values and statistics
    maintenance -- Can become the super-user
    firewall    -- Can view firewall configuration
    firewall-control-- Can modify firewall configuration
    secret      -- Can view secret configuration
    secret-control-- Can modify secret configuration
    rollback    -- Can rollback to previous configurations
    security    -- Can view security configuration
    security-control-- Can modify security configuration
    access      -- Can view access configuration
    access-control-- Can modify access configuration
    view-configuration-- Can view all configuration (not including secrets)
    flow-tap    -- Can view flow-tap configuration
    flow-tap-control-- Can configure flow-tap service
Individual command authorization:
    Allow regular expression: none
    Deny regular expression: none
    Allow configuration regular expression: none
    Deny configuration regular expression: none
```

show cli directory

Syntax show cli directory

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the current working directory.

Options This command has no options.

Required Privilege Level view

List of Sample Output **show cli directory on page 152**

Output Fields Table 29 on page 152 lists the output fields for the **show cli directory** command. Output fields are listed in the approximate order in which they appear.

Table 29: show cli directory Output Fields

Field Name	Field Description
Current directory	Pathname of the current working directory.

show cli directory

```
user@host> show cli directory
Current directory: /var/home/regress
```

show cli history

Syntax show cli history
<count>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display a list of previous CLI commands.

Options none—Display all previous CLI commands.

count—(Optional) Maximum number of commands to display.

Required Privilege Level view

List of Sample Output **show cli history on page 153**

Output Fields Table 30 on page 153 lists the output fields for the **show cli history** command. Output fields are listed in the approximate order in which they appear.

Table 30: show cli history Output Fields

Field Name	Field Description
timestamp	Time at which the command was entered.
command-syntax	Command that was entered.

show cli history

```
user@host> show cli history
  11:14:14 -- show arp
  11:22:10 -- show cli authorization
  11:27:12 -- show cli history
```

start shell

Syntax
start shell (csh | sh)
<user *username*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type **exit** from the shell.

Options
csh—Create a UNIX C shell.

sh—Create a UNIX Bourne shell.

user *username*—(Optional) Start the shell as another user.

Additional Information
When you are in the shell, the shell prompt has the following format:

username@hostname%

An example of the prompt is:

root@router%

Required Privilege Level
shell and maintenance

List of Sample Output
start shell csh on page 154

Output Fields
When you enter this command, you are provided feedback on the status of your request.

start shell csh

```
user@host> start shell csh
%

exit
%

username@hostname% start shell sh
%

exit
user@host>
```

PART 5

Junos OS for J-EX Series Switches System Setup

CHAPTER 14

System Setup Overview

Junos OS—Overview

J-EX Series Switch Software Features Overview

The following tables list the J-EX Series Switches software features and the Junos OS release in which they were introduced:

Related Documentation

- J-EX8208 Switch Hardware Overview on page 27
- J-EX8216 Switch Hardware Overview on page 30

Understanding Software Infrastructure and Processes

Each switch runs Junos OS for J-EX Series Switches on its general-purpose processors. The Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 158
- Junos OS Processes on page 158

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
  - Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of Junos OS, for added flexibility.

Table 55 on page 393 describes the primary Junos OS processes.

Related Documentation

- For more information about processes, see the *Junos OS Network Operations Guide* at http://www.juniper.net/techpubs/software/junos/.
- For more information about basic system parameters, supported protocols, and software processes, see the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

CHAPTER 15

Initial Configuration

Connecting and Configuring a J-EX Series Switch (CLI Procedure)

There are two ways to connect and configure a J-EX Series switch: one method is through the console using the CLI and the other is using the J-Web interface. This topic describes the CLI procedure.

NOTE: To run the ezsetup script, the switch must have the factory default configuration as the active configuration. If you have configured anything on the switch and want to run ezsetup, revert to the factory default configuration. See "Reverting to the Default Factory Configuration for the J-EX Series Switch" on page 341.

Before you begin connecting and configuring a J-EX Series switch through the console using the CLI:

- Set the following parameter values in the console server or PC:
  - Baud Rate—9600
  - Flow Control—None
  - Data—8
  - Parity—None

- Stop Bits—1
- DCD State—Disregard

To connect and configure the switch from the console:

1. Connect the console port to a laptop or PC using the RJ-45 to DB-9 serial port adapter. The RJ-45 cable and RJ-45 to DB-9 serial port adapter are supplied with the switch.
   - J-EX4200 switch—The console port is located on the rear panel of the switch.
   - J-EX8200 switch—The console port is located on the Switch Fabric and Routing Engine (SRE) module in slot SRE0 in a J-EX8208 switch or on the Routing Engine (RE) module in slot RE0 in a J-EX8216 switch.
2. At the Junos OS shell prompt **root%**, type **ezsetup**.
3. Enter the hostname. This is optional.
4. Enter the root password you plan to use for this device. You are prompted to re-enter the root password.
5. Enter **yes** to enable services like Telnet and SSH. By default, Telnet is not enabled and SSH is enabled.

   

   NOTE: When Telnet is enabled, you will not be able to log in to a J-EX Series switch through Telnet using root credentials. Root login is allowed only for SSH access.

6. Use the Management Options page to select the management scenario:

   

   NOTE: On J-EX8200 switches, only the out-of-band management option is available.

   - **Configure in-band management**. In this scenario you have the following two options:
     - Use the default VLAN.
     - Create a new VLAN—If you select this option, you are prompted to specify the VLAN name, VLAN ID, management IP address, and default gateway. Select the ports that must be part of this VLAN.
   - **Configure out-of-band management**. Specify the IP address and gateway of the management interface. Use this IP address to connect to the switch.
7. Specify the SNMP Read Community, Location, and Contact to configure SNMP parameters. These parameters are optional.
8. Specify the system date and time. Select the time zone from the list. These options are optional.

The configured parameters are displayed. Enter **yes** to commit the configuration.

The configuration is committed as the active configuration for the switch. You can now log in with the CLI or the J-Web interface to continue configuring the switch. If you use the J-Web interface to continue configuring the switch, the Web session is redirected to the new management IP address. If the connection cannot be made, the J-Web interface displays instructions for starting a J-Web session.

- Installing and Connecting a J-EX8216 Switch

Connecting and Configuring a J-EX Series Switch (J-Web Procedure)

There are two ways to connect and configure a J-EX Series switch: one method is through the console using the CLI and the other is using the J-Web interface. This topic describes the J-Web procedure.

To access the J-Web interface, your management device must have the following software installed:

- Operating system: Microsoft Windows XP Service Pack 3
- Browser version: One of the following. Other browsers might work but are not supported by J-Series platforms.
  - Microsoft Internet Explorer version 7.0
  - Mozilla Firefox version 3.0
- Additional requirements:
  - Only English-language browsers are supported.
  - The browser and the network must be able to receive and process HTTP/1.1 gzip compressed data.

NOTE: Before you begin the configuration, enable a DHCP client on the management PC you will connect to the switch so that the switch can obtain an IP address dynamically.

NOTE: Read the following steps before you begin the configuration. You must complete the initial configuration using EZSetup within 10 minutes. The switch exits EZSetup after 10 minutes and reverts to the factory default configuration, and the PC loses connectivity to the switch. The LCD displays a count-down timer when the switch is in initial setup mode.

To connect and configure the switch using the J-Web interface:

1. Transition the switch into initial setup mode by using the **Menu** and **Enter** buttons located to the right of the LCD panel (see Figure 4 on page 164)

Figure 4: LCD Panel in a J-EX4200 or J-EX8200 Switch

   a. Press the **Menu** button until you see **MAINTENANCE MENU**. Then press the **Enter** button.

   b. Press **Menu** until you see **ENTER EZSetup**. Then press **Enter**.

      If EZSetup does not appear as an option in the menu, select Factory Default to return the switch to the factory default configuration. EZSetup is displayed in the menu only when the switch is set to the factory default configuration.

   c. Press **Enter** to confirm setup and continue with EZSetup.

2. Connect the Ethernet cable from the Ethernet port on the PC to the switch.

   - J-EX4200 switch—Connect the cable to port 0 (**ge-0/0/0**) on the front panel of the switch.
   - J-EX8200 switch—Connect the cable to the port labeled **MGMT** on the Switch Fabric and Routing Engine (SRE) module in slot SRE0 in a J-EX8208 switch or on the Routing Engine (RE) module in slot RE0 in a J-EX8216 switch.

   These ports are configured as the DHCP server with the default IP address, **192.168.1.1**. The switch can assign an IP address to the management PC in the IP address range **192.168.1.2** through **192.168.1.253**.

3. From the PC, open a Web browser, type **http://192.168.1.1** in the address field, and press Enter.

4. On the J-Web login page, type **root** as the username, leave the password field blank, and click **Login**.

5. On the Introduction page, click **Next**.

6. On the Basic Settings page, modify the hostname, the root password, and date and time settings:

   a. Enter the hostname. This is optional.

   b. Enter a password and reenter the password.

   c. Specify the time zone.

d. Synchronize the date and time settings of the switch with the management PC or set them manually by selecting the appropriate option button. This is optional.

e. Click **Next**.

7. Use the Management Options page to select the management scenario:

NOTE: On J-EX8200 switches, only the out-of-band management option is available.

- **In-band Management—Use VLAN 'default' for management**.

  Select this option to configure all data interfaces as members of the default VLAN. Click **Next**. Specify the management IP address and the default gateway for the default VLAN.

- **In-band Management—Create new VLAN for management**.

  Select this option to create a management VLAN. Click **Next**. Specify the VLAN name, VLAN ID, member interfaces, management IP address, and default gateway for the new VLAN.

- **Out-of-band Management—Configure management port**.

  Select this option to configure only the management interface. Click **Next**. Specify the IP address and default gateway for the management interface.

8. Click **Next**.
9. On the Manage Access page, you may select options to enable Telnet, SSH, and SNMP services. For SNMP, you can configure the read community, location, and contact.
10. Click **Next**. The Summary screen displays the configured settings.
11. Click **Finish**.

The configuration is committed as the active switch configuration. You can now log in with the CLI or the J-Web interface to continue configuring the switch.

If you use the J-Web interface to continue configuring the switch, the Web session is redirected to the new management IP address. If the connection cannot be made, the J-Web interface displays instructions for starting a J-Web session.

NOTE: After the configuration is committed, the connectivity between the PC and the switch might be lost. To renew the connection, release and renew the IP address by executing the appropriate commands on the management PC or by removing and reinserting the Ethernet cable.

Related Documentation

- Connecting and Configuring a J-EX Series Switch (CLI Procedure) on page 161
- Installing and Connecting a J-EX4200 Switch

- Installing and Connecting a J-EX8208 Switch
- Installing and Connecting a J-EX8216 Switch

Configuring the LCD Panel on J-EX Series Switches (CLI Procedure)

The LCD panel on the front panel of J-EX Series switches displays a variety of information about the switch in the Status menu and provides the Maintenance menu to allow you to perform basic operations such as initial setup and reboot. You can disable these menus or individual menu options if you do not want switch users to use them. You can also set a custom message that will be displayed on the panel.

This topic describes:

- Disabling or Enabling Menus and Menu Options on the LCD Panel on page 166
- Configuring a Custom Display Message on page 167

Disabling or Enabling Menus and Menu Options on the LCD Panel

By default, the Maintenance menu, the Status menu, and the options in those menus in the LCD panel are enabled. Users can configure and troubleshoot the switch using the Maintenance menu and view certain details about the switch using the Status menu.

If you do not want users to be able to use those menus or use some of the menu options, you can disable the menus or individual menu options. You can re-enable the menus or menu options.

Issue the **show chassis lcd** operational mode command to see which menus and menu options are currently enabled.

NOTE: On some platforms you must specify an FPC slot number in these commands. See the **lcd-menu** statement for details.

To disable a menu:

```
[edit]
user@switch# set chassis lcd-menu menu-item menu-name disable
```

To enable a menu:

```
[edit]
user@switch# delete chassis lcd-menu menu-item menu-name disable
```

To disable a menu option:

```
[edit]
user@switch# set chassis lcd-menu menu-item menu-option disable
```

To enable a menu option:

```
[edit]
user@switch# delete chassis lcd-menu menu-item menu-option disable
```

Configuring a Custom Display Message

You can configure the second line of the LCD to display a custom message temporarily for 5 minutes or permanently.

To display a custom message temporarily:

- On a standalone J-EX4200 switch or a J-EX8200 switch:

  ```
  user@switch> set chassis display message message
  ```

- On a J-EX4200 switch in a Virtual Chassis configuration:

  ```
  user@switch> set chassis display message message fpc-slot slot-number
  ```

To display a custom message permanently:

- On a standalone J-EX4200 switch or a J-EX8200 switch:

  ```
  user@switch> set chassis display message message permanent
  ```

- On a J-EX4200 switch in a Virtual Chassis configuration:

  ```
  user@switch> set chassis display message message fpc-slot slot-number permanent
  ```

NOTE: The Menu button and the Enter button are disabled if the LCD is configured to display a custom message.

To disable the display of the custom message:

```
user@switch> clear chassis display message
```

You can view the custom message by issuing the command **show chassis lcd**.

Configuring Date and Time for the J-EX Series Switch (J-Web Procedure)

To configure date and time on a J-EX Series switch:

1. Select **Configure** > **System Properties** > **Date & Time**.
2. To modify the information, click **Edit**. Enter information into the Edit Date & Time page as described in Table 31 on page 168.
3. Click one:
   - To apply the configuration, click **OK**.
   - To cancel your entries and return to the System Properties page, click **Cancel**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

Table 31: Date and Time Settings

Time	Function	Your Action
Time Zone	Identifies the timezone that the switching platform is located in.	Select the appropriate time zone from the list.
Set Time	Synchronizes the system time with that of the NTP server. You can also manually set the system time and date.	To immediately set the time, click one: • **Synchronize with PC time**—The switch synchronizes the time with that of the PC. • **NTP Servers**—The switch sends a request to the NTP server and synchronizes the system time. • **Manual**—A pop-up window allows you to select the current date and time from a list.

Related Documentation

- J-Web User Interface for J-EX Series Switches Overview on page 129

Configuring System Identity for a J-EX Series Switch (J-Web Procedure)

To configure identification details for a J-EX Series switch:

1. Select **Configure** > **System Properties** > **System Identity**. The System Identity page displays configuration details.
2. To modify the configuration, click **Edit**. Enter information into the System Identity page as described in Table 32 on page 169.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

Table 32: Set Up Configuration Summary

Field	Function	Your Action
Host Name	Defines the hostname of the switching platform.	Type the hostname.
Domain Name	Defines the network or subnetwork that the machine belongs to.	Type the domain name.
Root Password	Sets the root password that user root can use to log in to the switching platform.	Type a plain-text password. The system encrypts the password. NOTE: After a root password has been defined, it is required when you log in to the J-Web user interface or the CLI.
Confirm Root Password	Verifies that the root password has been typed correctly.	Retype the password.
DNS Name Servers	Specifies a DNS server for the switching platform to use to resolve hostnames into addresses.	To add an IP address, click **Add**. To edit an IP address, click **Edit**. To delete an IP address, click **Delete**.
Domain Search	Specifies the domains to be searched.	To add a domain, click **Add**. To edit a domain click **Edit**. To delete a domain, click **Delete**.

CHAPTER 16

Configuration Statements for System Setup

arp

Syntax

```
arp {
    aging-timer minutes;
    passive-learning;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

Options

aging-timer—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.

passive-learning—Configures backup VRRP routers or switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests. By default, the backup VRRP router drops these requests; therefore, if the master router fails, the backup router must learn all entries present in the ARP cache of the master router. Configuring passive learning reduces transition delay when the backup router is activated.

Default: 20 minutes

Range: 5 to 240 minutes

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS ARP Learning and Aging Options for Mapping IPv4 Network Addresses to MAC Addresses
- *Junos OS Network Interfaces Configuration Guide*

authentication-key

Syntax authentication-key *key-number* type *type* value *password*;

Hierarchy Level [edit system ntp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Network Time Protocol (NTP) authentication keys so that the router or switch can send authenticated packets. If you configure the router or switch to operate in authenticated mode, you must configure a key.

Both the keys and the authentication scheme (MD5) must be identical between a set of peers sharing the same key number.

Options ***key-number***—Positive integer that identifies the key.

type *type*—Authentication type. It can only be **md5**.

value *password*—The key itself, which can be from 1 through 8 ASCII characters. If the key contains spaces, enclose it in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring NTP Authentication Keys
- **broadcast on page 174**
- **peer on page 194**
- **server on page 197**
- **trusted-key on page 200**

auxiliary

Syntax
```
auxiliary {
  type terminal-type;
}
```

Hierarchy Level [edit system **ports**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the characteristics of the auxiliary port.

Default The auxiliary port is disabled.

Options **type *terminal-type***—Type of terminal that is connected to the port.

Range: **ansi**, **vt100**, **small-xterm**, **xterm**

Default: The terminal type is unknown, and the user is prompted for the terminal type.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Set Console and Auxiliary Port Properties

boot-server (NTP)

Syntax boot-server *address*;

Hierarchy Level [edit system **ntp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the server that NTP queries when the router or switch boots to determine the local date and time.

When you boot the router or switch, it issues an **ntpdate** request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP will not be able to synchronize to a time server if the server's time appears to be very far off of the local router's or switch's time.

Options ***address***—Address of an NTP server. You must specify an address, not a hostname.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Synchronizing and Coordinating Time Distribution Using NTP

broadcast

Syntax broadcast *address* <key *key-number*> <version *value*> <ttl *value*>;

Hierarchy Level [edit system **ntp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the local router or switch to operate in broadcast mode with the remote system at the specified ***address***. In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast ***address***. Normally, you include this statement only when the local router or switch is operating as a transmitter.

Options ***address***—The broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be **224.0.1.1**.

key *key-number*—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.

Range: Any unsigned 32-bit integer

ttl *value*—(Optional) Time-to-live (TTL) value to use.

Range: 1 through 255

Default: 1

version *value*—(Optional) Specify the version number to be used in outgoing NTP packets.

Range: 1 through 4

Default: 4

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the NTP Time Server and Time Services

broadcast-client

Syntax broadcast-client;

Hierarchy Level [edit system ntp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Router or Switch to Listen for Broadcast Messages Using NTP

console (Physical Port)

Syntax

```
console {
  disable;
  insecure;
  log-out-on-disconnect;
  type terminal-type;
}
```

Hierarchy Level [edit system **ports**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the characteristics of the console port.

Default The console port is enabled and its speed is 9600 baud.

Options

disable—Disable console login connections.

insecure—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode.

log-out-on-disconnect—Log out the session when the data carrier on the console port is lost.

type *terminal-type*—Type of terminal that is connected to the port.

Range: **ansi**, **vt100**, **small-xterm**, **xterm**

Default: The terminal type is unknown, and the user is prompted for the terminal type.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Set Console and Auxiliary Port Properties

default-address-selection

Syntax default-address-selection;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Use the loopback interface, **lo0**, as the source address for all locally generated IP packets. The **lo0** interface is the interface to the router's or switch's Routing Engine.

Default The outgoing interface is used as the source address.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets
- *Junos OS Network Interfaces Configuration Guide*

domain-name (Router)

Syntax domain-name *domain-name*;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the name of the domain in which the router or switch is located. This is the default domain name that is appended to hostnames that are not fully qualified.

Options ***domain-name***—Name of the domain.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Domain Name for the Router or Switch

gre-path-mtu-discovery

Syntax (gre-path-mtu-discovery | no-gre-path-mtu-discovery);

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure path MTU discovery for outgoing GRE tunnel connections:

- **gre-path-mtu-discovery**—Path MTU discovery is enabled.
- **no-gre-path-mtu-discovery**—Path MTU discovery is disabled.

Default Path MTU discovery is enabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS for Path MTU Discovery on Outgoing GRE Tunnel Connections

host-name

Syntax host-name *hostname*;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the hostname of the router or switch.

Options ***hostname***—Name of the router or switch.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Hostname of the Router or Switch

icmpv4-rate-limit

Syntax

```
icmpv4-rate-limit {
    bucket-size seconds;
    packet-rate pps;
}
```

Hierarchy Level [edit system **internet-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure rate-limiting parameters for ICMPv4 messages sent.

Options

bucket-size *seconds*—Number of seconds in the rate-limiting bucket.

Range: 0 through 4294967295 seconds

Default: 5

packet-rate *pps*—Rate-limiting packets earned per second.

Range: 0 through 4294967295 pps

Default: 1000

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages

icmpv6-rate-limit

Syntax

```
icmpv6-rate-limit {
    bucket-size seconds;
    packet-rate packet-rate;
}
```

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure rate-limiting parameters for ICMPv6 messages sent.

Options

bucket-size *seconds*—Number of seconds in the rate-limiting bucket.

Range: 0 through 4294967295 seconds

Default: 5

packet-rate *pps*—Rate-limiting packets earned per second.

Range: 0 through 4294967295 pps

Default: 1000

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS ICMPv6 Rate Limit for ICMPv6 Routing Engine Messages

inet6-backup-router

Syntax inet6-backup-router *address* <destination *destination-address*>;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set a default router (running IP version 6 [IPv6]) to use while the local router or switch (running IPv6) is booting and if the routing protocol processes fail to start. The Junos OS removes the route to this router or switch as soon as the software starts.

Options ***address***—Address of the default router.

destination *destination-address*—(Optional) Destination address that is reachable through the backup router. Include this option to achieve network reachability while loading, configuring, and recovering the router or switch, but without the risk of installing a default route in the forwarding table.

Default: All hosts (default route) are reachable through the backup router.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring a Backup Router

internet-options

Syntax

```
internet-options {
  (gre-path-mtu-discovery | no-gre-path-mtu-discovery);
  icmpv4-rate-limit bucket-size bucket-size packet-rate packet-rate;
  icmpv6-rate-limit bucket-size bucket-size packet-rate packet-rate;
  (ipip-path-mtu-discovery | no-ipip-path-mtu-discovery);
  ipv6-duplicate-addr-detection-transmits;
  (ipv6-reject-zero-hop-limit | no-ipv6-reject-zero-hop-limit);
  (ipv6-path-mtu-discovery | no-ipv6-path-mtu-discovery);
  ipv6-path-mtu-discovery-timeout;
  no-tcp-rfc1323;
  no-tcp-rfc1323-paws;
  (path-mtu-discovery | no-path-mtu-discovery);
  source-port upper-limit <upper-limit>;
  (source-quench | no-source-quench);
  tcp-drop-synfin-set;
  tcp-mss mss-value;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure system IP options to protect against certain types of DoS attacks.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

ipip-path-mtu-discovery

Syntax (ipip-path-mtu-discovery | no-ipip-path-mtu-discovery);

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure path MTU discovery for outgoing IP-IP tunnel connections:

- **ipip-path-mtu-discovery**—Path MTU discovery is enabled.
- **no-ipip-path-mtu-discovery**—Path MTU discovery is disabled.

Default Path MTU discovery is enabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS for IP-IP Path MTU Discovery on IP-IP Tunnel Connections

ipv6-duplicate-addr-detection-transmits

Syntax ipv6-duplicate-addr-detection-transmits;

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Control the number of attempts for IPv6 duplicate address detection.

Default The default value is 3.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS for IPv6 Duplicate Address Detection Attempts

ipv6-path-mtu-discovery

Syntax (ipv6-path-mtu-discovery | no-ipv6-path-mtu-discovery);

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure path MTU discovery for IPv6 packets:

- **ipv6-path-mtu-discovery**—IPv6 path MTU discovery is enabled.
- **no-ipv6-path-mtu-discovery**—IPv6 path MTU discovery is disabled.

Default IPv6 path MTU discovery is enabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS for IPv6 Path MTU Discovery

ipv6-path-mtu-discovery-timeout

Syntax ipv6-path-mtu-discovery-timeout *minutes*;

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the IPv6 path MTU discovery timeout interval.

Options ***minutes***—IPv6 path MTU discovery timeout.
Default: 10 minutes

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS for IPv6 Path MTU Discovery

ipv6-reject-zero-hop-limit

Syntax (ipv6-reject-zero-hop-limit | no-ipv6-reject-zero-hop-limit);

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable and disable rejecting incoming IPv6 packets with a zero hop limit value in their header.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS for Acceptance of IPv6 Packets with a Zero Hop Limit

lcd-menu

Syntax

J-EX4200 switch:

```
lcd-menu fpc slot-number {
  menu-item (menu-name | menu-option);
}
```

J-EX8200 switch:

```
lcd-menu {
  menu-item (menu-name | menu-option);
}
```

Hierarchy Level [edit chassis]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Disable or enable the Maintenance menu or the Status menu in the LCD panel.

Options

none—(J-EX8200 switches only) Disable or enable the specified menu or menu options.

fpc *slot-number*—(J-EX4200 switches only) Disable or enable the specified menu or menu options, where ***slot-number*** is:

- 0—On a standalone J-EX4200 switch
- 0–9—On a J-EX4200 switch in a Virtual Chassis. The value is the member ID of the switch.

The remaining statement is explained separately.

Required Privilege Level

view-level—To view this statement in the configuration.
control-level—To add this statement to the configuration.

Related Documentation

location

Syntax

```
location {
  altitude feet;
  building name;
  country-code code;
  floor number;
  hcoord horizontal-coordinate;
  lata service-area;
  latitude degrees;
  longitude degrees;
  npa-nxx number;
  postal-code postal-code;
  rack number;
  vcoord vertical-coordinate;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the system location in various formats.

Options

altitude *feet*—Number of feet above sea level.

building *name*—Name of building. The name of the building can be 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").

country-code *code*—Two-letter country code.

floor *number*—Floor in the building.

hcoord *horizontal-coordinate*—Bellcore Horizontal Coordinate.

lata *service-area*—Long-distance service area.

latitude *degrees*—Latitude in degree format.

longitude *degrees*—Longitude in degree format.

npa-nxx *number*—First six digits of the phone number (area code and exchange).

postal-code *postal-code*—Postal code.

rack *number*—Rack number.

vcoord *vertical-coordinate*—Bellcore Vertical Coordinate.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Physical Location of the Router or Switch

menu-item

Syntax menu-item (*menu-name* | *menu-option*);

Hierarchy Level [edit chassis **lcd-menu**]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Disable or enable the Maintenance menu, the Status menu, or an individual option in one of those menus in the LCD panel.

Options ***menu-name***—Name of the LCD menu:

- **maintenance-menu**
- **status-menu**

menu-option—Specific option on one of the LCD menus. You must include the quotation marks when you type the option.

- **"maintenance-menu halt-menu"**—System halt option
- **"maintenance-menu system-reboot"**—System reboot option
- **"maintenance-menu rescue-config"**—Load rescue option
- **"maintenance-menu vc-uplink-config"**—(J-EX4200 switches only) Request VC port option for a J-EX4200 switch in a Virtual Chassis configuration
- **"maintenance-menu factory-default"**—Factory default option
- **"status-menu vcp-status"**—(J-EX4200 switches only) Virtual Chassis port (VCP) status for a J-EX4200 switch in a Virtual Chassis configuration
- **"status-menu sf-status1-menu"**—(J-EX8200 switches only) Status of the switch fabric on the Switch Fabric and Routing Engine (SRE) module in slot SRE0 on J-EX8208 switches. Status of the switch fabric on the Switch Fabric (SF) modules in slots SF0 and SF1 on J-EX8216 switches.
- **"status-menu sf-status2-menu"**—(J-EX8200 switches only) Status of the switch fabric on the SRE module in slot SRE1 on J-EX8208 switches. Status of the switch fabric on the SF modules in slots SF2–SF5 on J-EX8216 switches.
- **"status-menu sf-status3-menu"**—(J-EX8216 switches only) Status of the switch fabric on the SF modules in slots SF6 and SF7
- **"status-menu power-status"**—(J-EX4200 switches only) Status of the power supply
- **"status-menu psu-status1-menu"**—(J-EX8200 switches only) Status of the power supplies in slots P0 and P1
- **"status-menu psu-status2-menu"**—(J-EX8200 switches only) Status of the power supplies in slots P2–P5
- **"status-menu environ-status"**—Status of the fan and the temperature

- **"status-menu show-version"**—The version of Junos OS for J-EX Series switches loaded on the switch

Required Privilege Level
view-level—To view this statement in the configuration.
control-level—To add this statement to the configuration.

Related Documentation

multicast-client

Syntax
multicast-client <*address*>;

Hierarchy Level
[edit system **ntp**]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
For NTP, configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet.

Options
address—(Optional) One or more IP addresses. If you specify addresses, the router or switch joins those multicast groups.
Default: 224.0.1.1.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Router or Switch to Listen for Multicast Messages Using NTP

no-multicast-echo

Syntax no-multicast-echo;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the Routing Engine from responding to ICMP echo requests sent to multicast group addresses.

Default The Routing Engine responds to ICMP echo requests sent to multicast group addresses.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Disable the Routing Engine Response to Multicast Ping Packets

no-ping-record-route

Syntax no-ping-record-route;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Junos OS to disable the reporting of the IP address in ping responses.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

no-ping-time-stamp

Syntax no-ping-time-stamp;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Junos OS to disable the recording of timestamps in ping responses.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

no-redirects

Syntax no-redirects;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the sending of protocol redirect messages by the router or switch.

To disable the sending of redirect messages on a per-interface basis, include the **no-redirects** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]** hierarchy level.

Default The router or switch sends redirect messages.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Disable Protocol Redirect Messages on the Router or Switch
- *Junos OS Network Interfaces Configuration Guide*

no-tcp-rfc1323

Syntax no-tcp-rfc1323;

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Junos OS to disable RFC 1323 TCP extensions.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Disable TCP RFC 1323 Extensions

no-tcp-rfc1323-paws

Syntax no-tcp-rfc1323-paws;

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Junos OS to disable the RFC 1323 Protection Against Wrapped Sequence (PAWS) number extension.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Disable the TCP RFC 1323 PAWS Extension

ntp

Syntax

```
ntp {
  authentication-key number type type value password;
  boot-server address;
  broadcast <address> <key key-number> <version value> <ttl value>;
  broadcast-client;
  multicast-client <address>;
  peer address <key key-number> <version value> <prefer>;
  server address <key key-number> <version value> <prefer>;
  source-address source-address;
  trusted-key [ key-numbers ];
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure NTP on the router or switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Synchronizing and Coordinating Time Distribution Using NTP

path-mtu-discovery

Syntax (path-mtu-discovery | no-path-mtu-discovery);

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure path MTU discovery for outgoing Transmission Control Protocol (TCP) connections:

- **path-mtu-discovery**—Path MTU discovery is enabled.
- **no-path-mtu-discovery**—Path MTU discovery is disabled.

Default Path MTU discovery is enabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS for Path MTU Discovery on Outgoing TCP Connections

peer

Syntax peer *address* <key *key-number*> <version *value*> <prefer>;

Hierarchy Level [edit system **ntp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.

Options ***address***—Address of the remote system. You must specify an address, not a hostname.

key *key-number*—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.

Range: Any unsigned 32-bit integer

prefer—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.

version *value*—(Optional) Specify the NTP version number to be used in outgoing NTP packets.

Range: 1 through 4

Default: 4

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the NTP Time Server and Time Services

ports

Syntax

```
ports {
  auxiliary {
    type terminal-type;
  }
  console {
    type terminal-type;
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the properties of the console and auxiliary ports. The ports are located on the router's craft interface.

See the switch's hardware documentation for port locations.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Set Console and Auxiliary Port Properties

processes

Syntax

```
processes {
  process-name (enable | disable) failover (alternate-media | other-routing-engine);
  timeout seconds;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure which Junos OS processes are running on the router or switch.

CAUTION: Never disable any of the software processes unless instructed to do so by a customer support engineer.

Default All processes are enabled by default.

Options

(enable | disable)—(Optional) Enable or disable a specified process.

failover (alternate-media | other-routing-engine)—(Optional) For routers or switches with redundant Routing Engines only, switch to backup media if a process fails repeatedly. If a process fails four times within 30 seconds, the router or switch reboots from the alternate media or the other Routing Engine.

process-name—One of the valid process names. You can obtain a complete list of process names by using the CLI command completion feature. After specifying a process name, command completion also indicates any additional options for that process.

timeout *seconds*—(Optional) How often the system checks the watchdog timer, in seconds. If the watchdog timer has not been checked in the specified number of seconds, the system reloads. If you set the time value too low, it is possible for the system to reboot immediately after it loads.

Values: **15**, **60**, or **180**

Default: **180** seconds (rounded up to 291 seconds by the Junos OS kernel)

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Disabling Junos OS Processes

server (NTP)

Syntax server *address* <key *key-number*> <version *value*> <prefer>;

Hierarchy Level [edit system ntp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For NTP, configure the local router or switch to operate in client mode with the remote system at the specified ***address***. In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.

Options ***address***—Address of the remote system. You must specify an address, not a hostname.

key ***key-number***—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.

Range: Any unsigned 32-bit integer

prefer—(Optional) Mark the remote system as preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.

version *value*—(Optional) Specify the version number to be used in outgoing NTP packets.

Range: 1 through 4

Default: 4

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the NTP Time Server and Time Services

tcp-drop-synfin-set

Syntax tcp-drop-synfin-set;

Hierarchy Level [edit system internet-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to drop packets that have both the SYN and FIN bits set.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Enable the Router or Switch to Drop Packets with the SYN and FIN Bits Set

traceoptions (SBC Configuration Process)

Syntax

```
traceoptions {
  file filename <files number> <match regex> <size size>
    <world-readable | no-world-readable>;
  flag flag;
}
```

Hierarchy Level [edit system processes sbc-configuration-process]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure trace options for the session border controller (SBC) process of the border signaling gateway (BSG).

Options

file *filename*—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory **/var/log**. You can include the following file options:

- **files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

  If you specify a maximum number of files, you must also specify a maximum file size with the **size** option and a filename.

  Range: 2 through 1000
  Default: 3 files

- **match *regex***—(Optional) Refine the output to include lines that contain the regular expression.
- **no-world-readable**—(Optional) Disable unrestricted file access.
- **size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the trace-file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.

  Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB.
  Range: 10 KB through 1 GB
  Default: 128 KB

- **world-readable**—(Optional) Enable unrestricted file access.

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all** ***trace-level***—Trace all SBC process operations.
- **common** ***trace-level***—Trace common events.
- **configuration** ***trace-level***—Trace configuration events.
- **device-monitor** ***trace-level***—Trace device monitor events.
- **ipc** ***trace-level***—Trace IPC events.
- **memory—pool** ***trace-level***—Trace memory pool events.
- ***trace-level***—Trace level options are related to the severity of the event being traced. When you choose a trace level, messages at that level and higher levels are captured. Enter one of the following trace levels as the ***trace-level***:
  - **debug**—Log all code flow of control.
  - **error**—Log failures with a short-term effect.
  - **info**—Log summary for normal operations, such as the policy decisions made for a call.
  - **trace**—Log program trace START and EXIT macros.
  - **warning**—Log failure recovery events or failure of an external entity.
- **ui** ***trace-level***—Trace user interface operations.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- See “Troubleshooting the IMSG” in the *Junos OS Multiplay Solutions Guide*
- System Management Configuration Statements

trusted-key

Syntax trusted-key [*key-numbers*];

Hierarchy Level [edit system ntp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For NTP, configure the keys you are allowed to use when you configure the local router or switch to synchronize its time with other systems on the network.

Options ***key-numbers***—One or more key numbers. Each key can be any 32-bit unsigned integer except 0.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

CHAPTER 17

Operational Mode Commands for System Setup

clear chassis display message

Syntax clear chassis display message

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear or stop a text message on the craft interface display, which is on the front of the router or on the LCD panel display on the switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

Options none—Clear or stop a text message on the craft interface display.

Required Privilege Level clear

Related Documentation

- Configuring the LCD Panel Display on J-EX Series Switches (CLI Procedure) on page 166
- **set chassis display message on page 233**
- show chassis craft-interface

List of Sample Output **clear chassis display message on page 202**

Output Fields See show chassis craft-interface for an explanation of output fields.

clear chassis display message The following example displays and then clears the text message on the craft interface display:

```
user@host> show chassis craft-interface
Red alarm:     LED off, relay off
Yellow alarm:  LED off, relay off
Host OK LED:   On
Host fail LED: Off
FPCs     0  1  2  3  4  5  6  7
-------------------------------
Green  ..  *..  *  *.
Red    ........
LCD screen:
     +--------------------+
     |NOC contact Dusty   |
     |(888) 526-1234      |
     +--------------------+

user@host> clear chassis display message

user@host> show chassis craft-interface
Red alarm:     LED off, relay off
Yellow alarm:  LED off, relay off
Host OK LED:   On
Host fail LED: Off
FPCs     0  1  2  3  4  5  6  7
```

```

     |Temperature OK      |
     +--------------------+
```

clear system reboot

Syntax

clear system reboot
<both-routing-engines>

Syntax (J-EX Series Switch)

clear system reboot
<all-members>
<both-routing-engines>
<local>
<member *member-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear any pending system software reboots or halts.

Options

none—Clear all pending system software reboots or halts.

all-members—(J-EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.

both-routing-engines—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

local—(J-EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Required Privilege Level

maintenance

Related Documentation

- **request system reboot on page 101**

List of Sample Output

clear system reboot on page 205

Output Fields

When you enter this command, you are provided feedback on the status of your request.

clear system reboot

```
user@host> clear system reboot
reboot requested by root at Sat Dec 12 19:37:34 1998
[process id 17855]
Terminating...
```

configure

Syntax

configure
<dynamic>
<exclusive>
<private>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Enter configuration mode. When this command is entered without any optional keywords, everyone can make configuration changes and commit all changes made to the configuration.

Options

none—Enter configuration mode.

dynamic—(Optional) Configure routing policies and certain routing policy objects in a dynamic database that is not subject to the same verification required in the standard configuration database. As a result, the time it takes to commit changes to the dynamic database is much shorter than for the standard configuration database. You can then reference these policies and policy objects in routing policies you configure in the standard database.

exclusive—(Optional) Lock the candidate configuration for as long as you remain in configuration mode, allowing you to make changes without interference from other users. Other users can enter and exit configuration mode, but they cannot change the configuration.

private—(Optional) Allow multiple users to edit different parts of the configuration at the same time and to commit only their own changes, or to roll back without interfering with one another's changes. You cannot commit changes in configure private mode when another user is in configure exclusive mode.

Additional Information

For more information about the different methods of entering configuration mode and the restrictions that apply, see the *Junos OS System Basics Configuration Guide*.

Required Privilege Level

configure

Related Documentation

- **show configuration on page 244**

List of Sample Output

configure on page 206

Output Fields

When you enter this command, you are placed in configuration mode and the system prompt changes from ***hostname>*** to ***hostname#***.

configure

```
user@host> configure
Entering configuration mode
[edit]
user@host#
```

op

Syntax

op *filename*
<detail>
<*argument-name argument-value*>
<key (md5 | sha-256 | sha1) *key-value*
<url *url*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Execute an op script stored in one of the following locations:

- On the router or switch in the **/var/db/scripts/op** directory
- At a remote URL

Options

detail—(Optional) Display detailed output.

argument-name argument-value—(Optional) Specify one or more arguments to the script. For each argument you include on the command line, you must specify a corresponding value for the argument.

key (md5 | sha-256 | sha1) *key-value*—(Optional) With the <url> option, specify a checksum hash to verify the integrity of the script. You can include the <key> option if the **checksum** statement is included at the **[edit system scripts op file *filename*]** hierarchy level.

url *url*—(Optional) Specify a URL where the script is located.

Additional Information

For more information about Junos OS op scripts, see the *Junos OS Configuration and Operations Automation Guide*.

Required Privilege Level

maintenance

op url on page 208

Output Fields When you enter this command, you are provided feedback on the status of your request.

op `user@host>` **op script1 interface ge-0/2/0.0 protocol inet**

op url `user@host>` **op url https://www.juniper.net/fa/2009-04-01.01.slax key md5 8de24d09e1d90b2581bb937d2a5ad590 interface ge-0/2/0.0 protocol inet**

request chassis pic

Syntax request chassis pic (offline | online) fpc-slot *slot-number* pic-slot *slot-number*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Control the operation of the PIC.

NOTE: To view a list of built-in PICs on the router or switch chassis, use the show chassis hardware command.

Options offline—Take the PIC offline.

online—Bring the PIC online.

fpc-slot *slot-number*—Flexible PIC Concentrator (FPC) slot number. Replace ***slot-number*** with a value appropriate for your router or switch:

- J-EX Series switches:
  - J-EX4200 standalone switches—0.
  - J-EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch's member ID).
  - J-EX8208 switches—0 through 7 (line card).
  - J-EX8216 switches—0 through 15 (line card).

pic-slot *slot-number*—PIC slot number. For J-EX4200 switches, it is 0 for built-in network interfaces and 1 for interfaces on uplink modules. For J-EX8208 and J-EX8216 switches, it is 0.

Required Privilege Level maintenance

Related Documentation

- **show chassis hardware on page 643**
- **show chassis pic on page 650**

List of Sample Output **request chassis pic on page 209**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request chassis pic

```
user@host> request chassis pic pic-slot 0 online fpc-slot 0
FPC 0, PIC 0 is already online
```

request chassis routing-engine master

Syntax request chassis routing-engine master (acquire | release | switch)
<force>
<no-confirm>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For routers or switches with multiple Routing Engines, control which Routing Engine is the master.

NOTE: Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to "Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset," do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

Options acquire—Attempt to become the master Routing Engine.

release—Request that the other Routing Engine become the master.

switch—Toggle mastership between Routing Engines.

The **acquire**, **release**, and **switch** options have the following suboptions:

no-confirm—(Optional) Do not request confirmation for the switch.

force—(Optional) Available only with the acquire option. Force the change to a new master Routing Engine.

Additional Information Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (RE0) is the master and the Routing Engine in slot 1 (RE1) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the [**edit chassis redundancy**] hierarchy level in the configuration. For more information, see the *Junos OS System Basics Configuration Guide*

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

NOTE: Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

Required Privilege Level maintenance

Related Documentation
- **show chassis routing-engine on page 653**

List of Sample Output
request chassis routing-engine master acquire on page 211
request chassis routing-engine master switch on page 211

Output Fields When you enter this command, you are provided feedback on the status of your request.

request chassis routing-engine master acquire

```
user@host> request chassis routing-engine master acquire

warning: Traffic will be interrupted while the PFE is re-initialized

warning: The other routing engine's file system could be corrupted

Reset other routing engine and become master ? [yes,no] (no)
```

request chassis routing-engine master switch

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switch mastership back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.
```

request system halt

Syntax

request system halt
<at *time*>
<both-routing-engines>
<other-routing-engine>
<in *minutes*>
<media (compact-flash | disk | removable-compact-flash | usb)>
<message "*text*">

Syntax (J-EX Series Switch)

request system halt
<all-members>
<at *time*>
<both-routing-engines>
<in *minutes*>
<local>
<media (external | internal)>
<member *member-id*>
<message "*text*">
<other-routing-engine>
<slice *slice*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Stop the router or switch software.

Options

none—Stop the router or switch software immediately.

all-members—(J-EX4200 switches only) (Optional) Halt all members of the Virtual Chassis configuration.

at *time* —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- ***+minutes***—Number of minutes from now to stop the software.
- ***yymmddhhmm***—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to stop the software.

both-routing-engines—(Optional) Halt both Routing Engines at the same time.

local—(J-EX4200 switches only) (Optional) Halt the local Virtual Chassis member.

in *minutes*—(Optional) Number of minutes from now to stop the software. This option is an alias for the **at *+minutes*** option.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

media (external | internal)—(J-EX Series switches only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

member *member-id*—(J-EX4200 switches only) (Optional) Halt the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

message "*text*"—(Optional) Message to display to all system users before stopping the software.

other-routing-engine—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

slice *slice*—(J-EX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- **1**—Halt partition 1.
- **2**—Halt partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information

NOTE: If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), then halt the master Routing Engine. To halt a Routing Engine, issue the request system halt command. You can also halt both Routing Engines at the same time by issuing the request system halt both-routing-engines command.

Required Privilege Level

maintenance

List of Sample Output

request system halt on page 214
request system halt (in 2 Hours) on page 214
request system halt (Immediately) on page 214
request system halt (at 1:20 AM) on page 214

Output Fields

When you enter this command, you are provided feedback on the status of your request.

request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

request system halt (in 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

request system halt (Immediately)

```
user@host>  request system halt at now
```

request system halt (at 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymmdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

request system logout

Syntax request system logout (pid *pid* | terminal *terminal* | user *username*)
<all>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Log out users from the router or switch and the configuration database. If a user held the **configure exclusive** lock, this command clears the exclusive lock.

Options all—(Optional) Log out all sessions owned by a particular PID, terminal session, or user. (On a TX Matrix or TX Matrix Plus router, this command is broadcast to all chassis.)

pid *pid*—Log out the user session using the specified management process identifier (PID). The PID type must be management process.

terminal *terminal*—Log out the user for the specified terminal session.

user *username*—Log out the specified user.

Additional Information For information about using the **configure exclusive** command, see the *Junos OS System Basics Configuration Guide*.

Required Privilege Level configure

List of Sample Output **request system logout on page 215**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system logout

```
user@host> request system logout user tammy all
Connection closed by foreign host.
```

request system power-off

Syntax

request system power-off
<both-routing-engines>
<other-routing-engine>
<at *time*>
<in *minutes*>
<media (compact-flash | disk | removable-compact-flash | usb)>
<message "*text*">

Syntax (J-EX Series Switch)

request system power-off
<all-members>
<at *time*>
<both-routing-engines>
<in *minutes*>
<local>
<media (external | internal)>
<member *member-id*>
<message "*text*">
<other-routing-engine>
<slice *slice*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Power off the software.

Options

none—Power off the router or switch software immediately.

all-members—(J-EX4200 switches only) (Optional) Power off all members of the Virtual Chassis configuration.

at *time*—(Optional) Time at which to power off the software, specified in one of the following ways:

- **now**—Power off the software immediately. This is the default.
- ***+minutes***—Number of minutes from now to power off the software.
- ***yymmddhhmm***—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to power off the software.

both-routing-engines—(Optional) Power off both Routing Engines at the same time.

in *minutes*—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at *+minutes*** option.

local—(J-EX4200 switches only) (Optional) Power off the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

media (external | internal)—(J-EX Series switches only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

member *member-id*—(J-EX4200 switches only) (Optional) Power off the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

message "*text*"—(Optional) Message to display to all system users before powering off the software.

other-routing-engine—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

slice *slice*—(J-EX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

Required Privilege Level maintenance

List of Sample Output **request system power-off on page 217**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system power-off

```
user@host> request system power-off message “This router will be powered off in 30 minutes.
Please save your data and log out immediately.”
warning: This command will not halt the other routing-engine.
If planning to switch off power, use the both-routing-engines option.
Power Off the system ? [yes,no] (no) yes

*** FINAL System shutdown message from remote@nutmeg ***
System going down IMMEDIATELY

This router will be powered off in 30 minutes. Please save your data and log out
immediately.

Shutdown NOW!
[pid 5177]
```

request system reboot

Syntax

request system reboot
<other-routing-engine>
<at *time*>
<in *minutes*>
<media (compact-flash | disk | removable-compact-flash | usb)>
<message "*text*">

Syntax (J-EX Series Switch)

request system reboot
<all-members>
<at *time*>
<in *minutes*>
<local>
<media (external | internal)>
<member *member-id*>
<message "*text*">
<other-routing-engine>
<slice *slice*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Reboot the software.

Options

none—Reboot the software immediately.

all-members—(J-EX4200 switches only) (Optional) Reboot all members of the Virtual Chassis configuration.

at *time*—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **now**—Stop or reboot the software immediately. This is the default.
- ***+minutes***—Number of minutes from now to reboot the software.
- ***yymmddhhmm***—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to stop the software, specified in 24-hour time.

in *minutes*—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at *+minutes*** option.

local—(J-EX4200 switches only) (Optional) Reboot the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

media (external | internal)—(J-EX Series switches only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.

- **internal**—Reboot the internal flash device.

member *member-id*—(J-EX4200 switches only) (Optional) Reboot the specified member of the Virtual Chassis configuration Replace ***member-id*** with a value from 0 through 9.

message "*text*"—(Optional) Message to display to all system users before stopping or rebooting the software.

other-routing-engine—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

slice *slice*—(J-EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information

Reboot requests are recorded in the system log files, which you can view with the **show log** command (see **show log**). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see **show system processes**).

NOTE: To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

Required Privilege Level

maintenance

List of Sample Output

request system reboot on page 219
request system reboot (at 2300) on page 220
request system reboot (in 2 Hours) on page 220
request system reboot (Immediately) on page 220
request system reboot (at 1:20 AM) on page 220

Output Fields

When you enter this command, you are provided feedback on the status of your request.

request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

request system reboot (Immediately)

```
user@host> request system reboot at now
```

request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

request system reboot

Syntax

request system reboot
<all-members | local | member *member-id*>
<at *time*>
<in *minutes*>
<media (external | internal)>
<message "*text*">
<slice (1 | 2 | alternate)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Reboot the Junos OS.

Reboot requests are recorded in the system log files, which you can view with the **show log** command. You can view the process names with the **show system processes** command.

Options

none—Reboots the software immediately.

all-members | **local** | **member** ***member-id***—(J-EX4200 switch only) (Optional) Specify which member of the Virtual Chassis to reboot:

- **all-members**—Reboots each switch that is a member of the Virtual Chassis.
- **local**—Reboots the local switch, meaning the switch you are logged into, only.
- **member** ***member-id***—Reboots the specified member switch of the Virtual Chassis.

at *time*—(Optional) Time at which to reboot the software, specified in one of the following ways:

- ***+minutes***—Number of minutes from now to reboot the software.
- ***hh:mm***—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- ***yymmddhhmm***—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

in *minutes*—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at** ***+minutes*** option.

media (external | internal)—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

message "*text*"—(Optional) Message to display to all system users before rebooting the software.

slice (1 | 2 | alternate)—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

request system reboot (in 2 Hours) The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

request system reboot (Immediately)

```
user@host> request system reboot at now
```

request system reboot (at 1:20 AM) To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

request system scripts convert

Syntax **request system scripts convert (slax-to-xslt | xslt-to-slax) source *source/filename* destination *destination/<filename>***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Convert an Extensible Stylesheet Language Transformations (XSLT) script to Stylesheet Language, Alternative syntaX (SLAX), or convert a SLAX script to XSLT.

Options destination *destination/<filename>*—Specify a destination for the converted file.

Optionally, you can specify a filename for the converted file. If you do not specify a filename, the software assigns one automatically. The default destination filename is the same as the source filename, except the file extension is altered. For example, the software converts a source file called **test.xsl** to **test.slax**. The software converts a source file called **test1.slax** to **test1.xsl**.

slax-to-xslt—Convert a SLAX script to XSLT.

source *source/filename*—Specify a source file that you want to convert.

xslt-to-slax—Convert an XSLT script to SLAX.

Required Privilege Level maintenance

List of Sample Output
request system scripts convert slax-to-xslt on page 223
request system scripts convert xslt-to-slax on page 223

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system scripts convert slax-to-xslt

```
user@host> request system scripts convert slax-to-xslt source /var/db/scripts/op/script1.slax
destination /var/db/scripts/op
conversion complete
```

request system scripts convert xslt-to-slax

```
user@host> request system scripts convert xslt-to-slax source /var/db/scripts/commit/script1.xsl
destination /var/db/scripts/commit
conversion complete
```

request system scripts refresh-from commit

Syntax **request system scripts refresh-from commit file *file-name* url *url-path***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Automatically download the initial Junos OS configuration and a set of standard commit scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:

```
<request-script-refresh-from>
   <type>commit</type>
   <file>file-name></file>
   <URL>URL</URL>
</request-script-refresh-from>
```

Options file *file-name*—Name of the file to be downloaded.

url *url-path*—URL of the file to be downloaded.

Required Privilege Level maintenance

request system storage cleanup

Syntax request system storage cleanup <dry-run>

Syntax (J-EX Series Switch)
request system storage cleanup
<all-members>
<dry-run>
<local>
<member *member-id*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion.

Options
all-members—(J-EX4200 switches only) (Optional) Delete files on all members of the Virtual Chassis configuration.

dry-run—(Optional) List files proposed for deletion (without deleting them).

local—(J-EX4200 switches only) (Optional) Delete files on the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Additional Information If logging is configured and being used, the **dry-run** option will rotate the log files. In that case, the output displays the message "Currently rotating log files, please wait." If no logging is currently underway, the output displays only a list of files to delete.

Required Privilege Level maintenance

List of Sample Output
request system storage cleanup dry-run on page 227
request system storage cleanup on page 228

Output Fields When you enter this command, you are provided feedback on the status of your request.

request system storage cleanup dry-run

```

```

restart

Syntax

restart
<adaptive-services | audit-process | chassis-control | class-of-service | dhcp-service | diameter-service | disk-monitoring | dynamic-flow-capture | ecc-error-logging | event-processing | firewall | interface-control | ipsec-key-management | kernel-replication | l2-learning | l2tp-service | lacp | mib-process | pgcp-service | pgm | pic-services-logging | ppp | pppoe | protected-system-domain-service | redundancy-interface-process | remote-operations | root-system-domain-service | routing <logical-system *logical-system-name*> | sampling | service-deployment | services pgcp gateway *gateway-name* |sbc-configuration-process | snmp | usb-control| web-management>
<gracefully | immediately | soft>

Syntax (J-EX Series Switch)

restart
<autoinstallation | chassis-control | class-of-service | database-replication | dhcp | dhcp-service | diameter-service | dot1x-protocol | ethernet-link-fault-management | ethernet-switching | event-processing | firewall | general-authentication-service | interface-control | kernel-replication | l2-learning | lacp | license-service | link-management | lldpd-service | mib-process | mountd-service | multicast-snooping | pgm | redundancy-interface-process | remote-operations | routing | secure-neighbor-discovery | service-deployment | sflow-service | snmp | vrrp | web-management>
<gracefully | immediately | soft>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Restart a Junos OS process.

CAUTION: Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

Options

none—Same as **gracefully**.

adaptive-services—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

audit-process—(Optional) Restart the RADIUS accounting process.

autoinstallation—(J-EX Series switch only) (Optional) Restart the autoinstallation process.

chassis-control—(Optional) Restart the chassis management process.

class-of-service—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

database-replication—(J-EX Series switch only) (Optional) Restart the database replication process.

dhcp—(J-EX Series switch only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

dhcp-service—(J-EX Series switch only) (Optional) Restart the Dynamic Host Configuration Protocol process.

diameter-service—(Optional) Restart the diameter process.

disk-monitoring—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

dot1x-protocol—(J-EX Series switch only) (Optional) Restart the port-based network access control process.

dynamic-flow-capture—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Restart the error checking and correcting (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-link-fault-management—(J-EX Series switch only) (Optional) Restart the Ethernet OAM link fault management process.

ethernet-switching—(J-EX Series switch only) (Optional) Restart the Ethernet switching process.

event-processing—(Optional) Restart the event process (eventd).

firewall—(Optional) Restart the firewall management process, which manages firewall configuration.

general-authentication-service—(J-EX Series switch only) (Optional) Restart the general authentication process.

gracefully—(Optional) Restart the software process.

immediately—(Optional) Immediately restart the software process.

interface-control—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

ipsec-key-management—(Optional) Restart the IPsec key management process.

kernel-replication—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover is configured.

l2-learning—(Optional) Restart the Layer 2 address flooding and learning process.

lacp—(Optional) Restart the Link Aggregation Control Protocol process.

license-service—(J-EX Series switch only) (Optional) Restart the feature license management process.

lldpd-service—(J-EX Series switch only) (Optional) Restart the Link Layer Discovery Protocol process.

mib-process—(Optional) Restart the Management Information Base (MIB) II process, which provides the router's MIB II agent.

mountd-service—(J-EX Series switch only) (Optional) Restart the service for NFS mounts requests.

multicast-snooping—(J-EX Series switch only) (Optional) Restart the multicast snooping process.

pgcp-service—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

pgm—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

pic-services-logging—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

ppp—(Optional) Restart the Point-to-Point Protocol (PPP) process.

pppoe—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process.

protected-system-domain-service—(Optional) Restart the Protected System Domain (PSD) process.

redundancy-interface-process—(Optional) Restart the ASP redundancy process.

remote-operations—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

root-system-domain-service—(Optional) Restart the Root System Domain (RSD) service.

routing—(J-EX Series switch only) (Optional) Restart the routing protocol process.

routing <logical-system *logical-system-name*>—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

sampling—(Optional) Restart the sampling process, which performs packet sampling and cflowd export.

secure-neighbor-discovery—(J-EX Series switch only) (Optional) Restart the secure Neighbor Discovery Protocol process.

service-deployment—(Optional) Restart the service deployment service process.

services pgcp gateway *gateway-name*—(Optional) Restart the pgcpd process for a specific BGF running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

sflow-service—(J-EX Series switch only) (Optional) Restart the flow sampling (sFlow technology) process.

snmp—(Optional) Restart the SNMP process, which provides the router's or switch's SNMP master agent.

soft—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

vrrp—(J-EX Series switch only) (Optional) Restart the Virtual Router Redundancy Protocol process.

web-management—(J-EX Series switch only) (Optional) Restart the Web management process.

Required Privilege Level reset

Output Fields When you enter this command, you are provided feedback on the status of your request.

restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

set chassis display message

Syntax set chassis display message "*message*"
<permanent>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display or stop a text message on the craft interface display, which is on the front of the router, or on the LCD panel display on the switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

Options

"*message*"—Message to display. On the craft interface display, if the message is longer than 20 characters, it wraps onto the next line. If a word does not fit on one line, the entire word moves down to the next line. Any portion of the message that does not fit on the display is truncated. An empty pair of quotation marks (“ ”) deletes the text message from the craft interface display. On the LCD panel, display, the message is limited to 16 characters.

fpc-slot *slot-number*—(J-EX4200 switches only) On the router, display the text message on the craft interface for a specific Flexible PIC Concentrator (FPC). Replace ***slot-number*** with a value from **0** through **31**. On the switch, display the text message for a specific member of a virtual chassis, where **fpc-slot *slot-number*** corresponds to the member ID. Replace ***slot-number*** with a value from 0 through 9.

permanent—(Optional) Display a text message on the craft interface display or LCD panel display permanently.

Required Privilege Level clear

List of Sample Output

set chassis display message (Creating) on page 233
set chassis display message (Deleting) on page 234

Output Fields See show chassis craft-interface for an explanation of output fields.

set chassis display message (Creating) The following example shows how to set the display message and verify the result:

```
user@host> set chassis display message "NOC contact Dusty (888) 555-1234"
message sent

user@host> show chassis craft-interface
```

```
Red alarm:     LED off, relay off
Yellow alarm:  LED off, relay off
Host OK LED:   On
Host fail LED: Off
FPCs     0  1  2  3  4  5  6  7
-------------------------------
Green  ..  *..  *  *.
Red    ........
LCD screen:
     +--------------------+
     |NOC contact Dusty   |
     |(888) 555-1234      |
     +--------------------+
```

set chassis display message (Deleting)

The following example shows how to delete the display message and verify that the message is removed:

```
user@host> set chassis display message ""
message sent

user@host> show chassis craft-interface
Red alarm:     LED off, relay off
Yellow alarm:  LED off, relay off
Host OK LED:   On
Host fail LED: Off
FPCs     0  1  2  3  4  5  6  7
-------------------------------
Green  ..  *..  *  *.

     |                    |
     |Temperature OK      |
     +--------------------+
```

set date

Syntax set date (*date-time* | ntp <*ntp-server*> <source-address *source-address*>)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the date and time.

Options *date-time*—Date and time. Enter this string inside quotation marks.

ntp—Use a Network Time Protocol (NTP) server to synchronize the current date and time setting on the router or switch.

ntp-server—(Optional) Specify the IP address of one or more NTP servers.

source-address *source-address*—(Optional) Specify the source address that the router or switch uses to contact the remote NTP server.

Required Privilege Level view

```

show chassis firmware

Syntax show chassis firmware

Release Information Command introduced in Junos OS Release 10.2 for J-EX Series switches.

Description On the routers, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), and Flexible PIC Concentrators (FPCs). On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).

On J-EX4200 switches, display the version levels of the firmware running on the switch. On a J-EX8208 switch, display the version levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On a J-EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

Options none—Display the version levels of the firmware running. For a J-EX4200 switch that is a member of a Virtual Chassis, display version levels for all members.

Required Privilege Level view

List of Sample Output **show chassis firmware (J-EX8200 Switch) on page 236**

Output Fields Table 33 on page 236 lists the output fields for the **show chassis firmware** command. Output fields are listed in the approximate order in which they appear.

Table 33: show chassis firmware Output Fields

Field Name	Field Description
Part	Chassis part name.
Type	Type of firmware: On routers: **ROM** or **O/S.** On switches: **uboot** or **loader**.
Version	Version of firmware running on the chassis part.

show chassis lcd

Syntax

show chassis lcd
<fpc-slot <*fpc-slot-number*>>
<menu <(all-members | local | member *member-id*)>>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.
menu option introduced in Junos OS Release 10.2 for J-EX Series switches.

Description

Display the information that appears on the LCD panel of J-EX4200 and J-EX8200 switches. Display the status of the currently selected port parameter of the Status LED for each network port on the switch or line card.

Options

none—Display the information that appears on the LCD panel (for J-EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.

fpc-slot <*fpc-slot-number*>—(Optional) Display the information as follows:

- For the standalone J-EX4200 switch (***fpc-slot-number*** equals 0)
- For all J-EX4200 switches in a Virtual Chassis (**fpc-slot** with no ***fpc-slot-number*** value specified)
- For a specific Virtual Chassis member (***fpc-slot-number*** equals member ID value)
- For the line card in the specified slot on a J-EX8200 switch (***fpc-slot-number*** equals slot number)

menu—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

menu all-members—(J-EX4200 switches only) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

menu local—(J-EX4200 switches only) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

menu member *member-id*—(J-EX4200 switches only) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

List of Sample Output

Output Fields

Table 34 on page 239 lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

Table 34: show chassis lcd Output Fields

Field Name	Field Description
Front panel contents for slot **Front panel contents** (J-EX8200 switches)	FPC slot number of the switch whose content is being displayed. The number is always **0**, except for J-EX4200 switches in a Virtual Chassis, where it is the member ID value. On J-EX8200 switches, no slot number is displayed.
LCD screen	The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for J-EX8200 switches, displays **RE** and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are: • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **POE**—Power over Ethernet (J-EX4200 switches only)
LEDs status	Current state of the Alarms, Status, and Master LEDs (chassis status LEDs).
Interface	Names of the interfaces on the switch.
LED (ADM/SPD/DPX/POE)	State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are: NOTE: J-EX8200 switches do not have the POE port parameter. • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **POE**—Power over Ethernet
fpc*x*	On J-EX4200 switches, member ID of the Virtual Chassis member whose LCD menu is displayed.

status-menu show-version
maintenance-menu
maintenance-menu halt-menu
maintenance-menu system-reboot
maintenance-menu rescue-config
maintenance-menu factory-default
```

show configuration

Syntax show configuration
<*statement-path*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the configuration that currently is running on the router or switch, which is the last committed configuration.

Options none—Display the entire configuration.

statement-path—(Optional) Display one of the following hierarchies in a configuration. (Each ***statement-path*** option has additional suboptions not described here. See the appropriate configuration guide or J-EX Series switch documentation for more information.)

- **access**—Network access configuration.
- **access-profile**—Access profile configuration.
- **accounting-options**—Accounting data configuration.
- **applications**—Applications defined by protocol characteristics.
- **apply-groups**—Groups from which configuration data is inherited.
- **chassis**—Chassis configuration.
- **chassis network-services**—Current running mode.
- **class-of-service**—Class-of-service configuration.
- **diameter**—Diameter base protocol layer configuration.
- **ethernet-switching-options**—(J-EX Series switch only) Ethernet switching configuration.
- **event-options**—Event processing configuration.
- **firewall**—Firewall configuration.
- **forwarding-options**—Options that control packet sampling.
- **groups**—Configuration groups.
- **interfaces**—Interface configuration.
- **jsrc**—JSRC partition configuration.
- **jsrc-partition**—JSRC partition configuration.
- **logical-systems**—Logical system configuration.
- **poe**—(J-EX Series switch only) Power over Ethernet configuration.
- **policy-options**—Routing policy option configuration.
- **protocols**—Routing protocol configuration.

- **routing-instances**—Routing instance configuration.
- **routing-options**—Protocol-independent routing option configuration.
- **security**—Security configuration.
- **services**—Service PIC applications configuration.
- **snmp**—Simple Network Management Protocol configuration.
- **system**—System parameters configuration.
- **virtual-chassis**—(J-EX Series switch only) Virtual Chassis configuration.
- **vlans**—(J-EX Series switch only) VLAN configuration.

Additional Information The portions of the configuration that you can view depend on the user class that you belong to and the corresponding permissions. If you do not have permission to view a portion of the configuration, the text **ACCESS-DENIED** is substituted for that portion of the configuration. If you do not have permission to view authentication keys and passwords in the configuration, because the **secret** permission bit is not set for your user account, the text **SECRET-DATA** is substituted for that portion of the configuration. If an identifier in the configuration contains a space, the identifier is displayed in quotation marks.

show host

Syntax show host *hostname*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Domain Name System (DNS) hostname information.

Options *hostname*—Hostname or address.

Additional Information The **show host** command displays the raw data received from the DNS server.

Required Privilege Level view

List of Sample Output **show host on page 247**

show host

```
user@host> show host snark
snark.boojum.net has address 192.168.1.254

Address: 192.168.1.254
Aliases:
```

show ntp associations

Syntax show ntp associations
<no-resolve>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Network Time Protocol (NTP) peers and their state.

Options none—Display NTP peers and their state.

no-resolve—(Optional) Suppress symbolic addressing.

List of Sample Output **show ntp associations on page 249**

Output Fields Table 35 on page 248 describes the output fields for the **show ntp associations** command. Output fields are listed in the approximate order in which they appear.

Table 35: show ntp associations Output Fields

Field Name	Field Description
remote	Address or name of the remote NTP peer.
refid	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of **0.0.0.0**.
st	Stratum of the remote peer.
t	Type of peer: **b** (broadcast), **l** (local), **m** (multicast), or **u** (unicast).
when	When the last packet from the peer was received.
poll	Polling interval, in seconds.
reach	Reachability register, in octal.
delay	Current estimated delay of the peer, in milliseconds.
offset	Current estimated offset of the peer, in milliseconds.
disp	Current estimated dispersion of the peer, in milliseconds.

Table 35: show ntp associations Output Fields *(continued)*

Field Name	Field Description
peer-name	Peer name and status of the peer in the clock selection process: • space—Discarded because of a high stratum value or failed sanity checks. • **x**—Designated "falseticker", by the intersection algorithm. • **.**—Culled from the end of the candidate list. • **-** —Discarded by the clustering algorithm. • **+**—Included in the final selection set. • **#**—Selected for synchronization, but the distance exceeds the maximum. • ***—Selected for synchronization. • **o**—Selected for synchronization, but the packets-per-second (pps) signal is in use.

show system firmware

Syntax show system firmware
<compatibility>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX8200 switches only) Display firmware information.

Options compatibility—(Optional) Display firmware compatibility information.

Required Privilege Level view

List of Sample Output
show system firmware on page 251
show system firmware compatibility on page 251

Output Fields Table 36 on page 251 lists the output fields for the show system firmware command. Output fields are listed in the approximate order in which they appear.

Table 36: show system firmware Output Fields

Field Name	Field Description
Part	Physical part on the router or switch affected by the firmware.
Type	Type of firmware on the router or switch.
Tag	Location of the firmware on the interface.
Current version	Firmware version on the affected router or switch parts.
Available version	New versions of firmware for upgrading or downgrading.
Status	Firmware condition on the router or switch.
Action	Whether you can upgrade or downgrade, or if no action is available (**none**).

show system firmware

```
user@host> show system firmware

FPC 0            ROM Monitor 0  0   6.4.10              None
Routing Engine 0 RE BIOS        0   0                   None
```

show system reboot

Syntax
show system reboot
<both-routing-engines>

Syntax (J-EX Series Switch)
show system reboot
<all-members>
<both-routing-engines>
<local>
<member *member-id*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display pending system reboots or halts.

Options
none—Display pending reboots or halts on the active Routing Engine.

all-members—(J-EX4200 switches only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.

both-routing-engines—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

local—(J-EX4200 switches only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

maintenance

List of Sample Output
show system reboot on page 252

show system reboot

```
user@host> show system reboot
reboot requested by root at Wed Feb 10 17:40:46 1999
[process id 17885]
```

show system snapshot

Syntax

show system snapshot
<all-members | local | member *member-id*>
<media (external | internal)>
<slice (1 | 2 | alternate)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the complete collection of files in a snapshot.

Options

none—Display the system snapshot on the alternate media, which is the media that does not have the software packages that last booted the switch.

all-members | local | member *member-id*—(J-EX4200 switch only) Display the snapshot in a Virtual Chassis configuration:

- **all-members**—Display the snapshot for each switch that is a member of the Virtual Chassis.
- **local**—Display the snapshot on the switch that you are currently logged into.
- **member *member-id***—Display the snapshot for the specified member switch of the Virtual Chassis.

media (external | internal)—(Optional) Display the destination media location for the snapshot. The **external** option specifies the snapshot on an external mass storage device, such as a USB flash drive. The **internal** option specifies the snapshot on an internal memory source, such as internal flash memory.

slice (1 | 2 | alternate)—Display the snapshot in a partition:

- **1**—Display the snapshot in partition 1.
- **2**—Display the snapshot in partition 2.
- **alternate**—Display the snapshot in the alternate partition, which is the partition that did not boot the switch at the last bootup.

show system software

Syntax
show system software
<detail>

Syntax (J-EX Series Switch)
show system software
<all-members>
<detail>
<local>
<member *member-id*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display the Junos OS extensions loaded on your router or switch.

Options
none—Display standard information about all loaded Junos OS extensions.

all-members—(J-EX4200 switches only) (Optional) Display the system software running on all members of the Virtual Chassis configuration.

detail—(Optional) Display detailed information about available Junos OS extensions.

local—(J-EX4200 switches only) (Optional) Display the system software running on the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display the system software running on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

scc—(Routing matrix only) (Optional) Display the system software running on a TX Matrix router (or switch-card chassis).

show system storage

Syntax

show system storage
<detail>

Syntax (J-EX Series Switch)

show system storage
<detail>
<all-members>
<local>
<member *member-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display statistics about the amount of free disk space in the router's or switch's file systems.

Options

none—Display standard information about the amount of free disk space in the router's or switch's file systems.

detail—(Optional) Display detailed output.

all-members—(J-EX4200 switches only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.

local—(J-EX4200 switches only) (Optional) Display system storage statistics for the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Output Fields

Table 37 on page 258 describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

Table 37: show system storage Output Fields

Field Name	Field Description
Filesystem	Name of the file system.
Size	Size of the file system.
Used	Amount of space used in the file system.
Avail	Amount of space available in the file system.
Capacity	Percentage of the file system's space that is being used.

Table 37: show system storage Output Fields *(continued)*

Field Name	Field Description
Mounted on	Directory in which the file system is mounted.

```

show system switchover

Syntax show system switchover

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display whether graceful Routing Engine switchover is configured, the state of the kernel replication (ready or synchronizing), any replication errors, and whether the primary and standby Routing Engines are using compatible versions of the kernel database.

NOTE: Issue the **show system switchover** command *only* on the backup Routing Engine. This command is *not* supported on the master Routing Engine. because the **kernel-replication** process daemon does not run on the master Routing Engine. This process runs only on the backup Routing Engine.

Options

Required Privilege Level view

List of Sample Output **show system switchover (Backup Routing Engine) on page 261**

Output Fields Table 38 on page 260 describes the output fields for the **show system switchover** command. Output fields are listed in the approximate order in which they appear.

Table 38: show system switchover Output Fields

Field Name	Field Description
Graceful switchover	Display graceful Routing Engine switchover status: • **On**—Indicates **graceful-switchover** is specified for the **routing-options** configuration command. • **Off**—Indicates **graceful-switchover** is not specified for the **routing-options** configuration command.
Configuration database	State of the configuration database: • **Ready**—Configuration database has synchronized. • **Synchronizing**—Configuration database is synchronizing. Displayed when there are updates within the last 5 seconds. • **Synchronize failed**—Configuration database synchronize process failed.
Kernel database	State of the kernel database: • **Ready**—Kernel database has synchronized. • **Synchronizing**—Kernel database is synchronizing. Displayed when there are updates within the last 5 seconds. • **Version incompatible**—The primary and standby Routing Engines are running incompatible kernel database versions. • **Replication error**—An error occurred when the state was replicated from the primary Routing Engine. Inspect **/var/log/ksyncd** for possible causes, or notify Dell Support (see "Requesting Technical Support" on page lxxi).

Table 38: show system switchover Output Fields *(continued)*

Field Name	Field Description
Peer state	Routing Engine peer state: • **Steady State**—Peer completed switchover transition. • **Peer Connected**—Peer in switchover transition.

show system switchover (Backup Routing Engine)

```
user@host> show system switchover
Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady State
```

show system uptime

Syntax show system uptime

Syntax (J-EX Series Switch)
show system uptime
<all-members>
<local>
<member *member-id*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.

Options
none—Show time since the system rebooted and processes started.

all-members—(J-EX4200 switches only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

local—(J-EX4200 switches only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Required Privilege Level view

List of Sample Output **show system uptime on page 263**

Output Fields Table 39 on page 262 describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

Table 39: show system uptime Output Fields

Field Name	Field Description
Current time	Current system time in UTC.
System booted	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
Protocols started	Date and time when the routing protocols were last started and how long they have been running.
Last configured	Date and time when a configuration was last committed. Also shows name of user who issued the last **commit** command.
***time* and up**	Current time, in the local time zone, and how long the router or switch has been operational.
users	Number of users logged in to the router or router.

Table 39: show system uptime Output Fields *(continued)*

Field Name	Field Description
load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

show system uptime

```
user@host> show system uptime
Current time:      1998-10-13 19:45:47 UTC
System booted:     1998-10-12 20:51:41 UTC (22:54:06 ago)
Protocols started: 1998-10-13 19:33:45 UTC (00:12:02 ago)
Last configured:   1998-10-13 19:33:45 UTC (00:12:02 ago) by abc
12:45PM  up 22:54, 2 users, load averages: 0.07, 0.02, 0.01
```

show system users

Syntax show system users
<no-resolve>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description List information about the users who are currently logged in to the router or switch.

NOTE: The **show system users** command does not list information about the automated users that are currently logged in to the router or switch from a remote client application using Junos XML APIs, such as NETCONF. It only shows details of administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client.

Options none—List information about the users who are currently logged in to the router or switch.

no-resolve—(Optional) Do not attempt to resolve IP addresses to hostnames.

Required Privilege Level view

List of Sample Output **show system users on page 265**

Output Fields Table 40 on page 264 describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

Table 40: show system users Output Fields

Field Name	Field Description
time **and up**	Current time, in the local time zone, and how long the router or switch has been operational.
users	Number of users logged in to the router or switch.
load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.
USER	Username.
TTY	Terminal through which the user is logged in.
FROM	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.
LOGIN@	Time when the user logged in.
IDLE	How long the user has been idle.
WHAT	Processes that the user is running.

show system users

```
user@host> show system users
 7:30PM  up 4 days,  2:26, 2 users, load averages: 0.07, 0.02, 0.01
USER     TTY FROM              LOGIN@  IDLE WHAT
root     d0  -                Fri05PM 4days -csh (csh)

```

show system virtual-memory

Syntax show system virtual-memory

Syntax (J-EX Series Switch)
show system virtual-memory
<all-members>
<local>
<member *member-id*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use **show system virtual-memory** for troubleshooting with Dell Support (see "Requesting Technical Support" on page lxxi).

Options none—Display kernel dynamic memory usage information.

all-members—(J-EX4200 switches only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.

local—(J-EX4200 switches only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Additional Information

NOTE: The show system virtual-memory command with the | display XML pipe option displays XML output for the command in the parent tags: <vmstat-memstat-malloc>, <vmstat-memstat-zone>, <vmstat-sumstat>, <vmstat-intr>, and <vmstat-kernel-state> with each child element as a separate XML tag.

Required Privilege Level view

show system virtual-memory on page 268
show system virtual-memory | display xml on page 272

Output Fields Table 41 on page 267 lists the output fields for the **show system virtual-memory** command. Output fields are listed in the approximate order in which they appear.

Table 41: show system virtual-memory Output Fields

Field Name	Field Description
Memory statistics by bucket size	
Size	Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.
In Use	Number of memory blocks of this size that are in use (bytes).
Free	Number of memory blocks of this size that are free (bytes).
Requests	Number of memory allocation requests made.
HighWater	Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value.
Couldfree	Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.
Memory usage type by bucket size	
Size	Memory block size (bytes).
Type(s)	Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.
Memory statistics by type	
Type	Kernel module that is using dynamic memory.
InUse	Number of memory blocks used by this type. The number is rounded up.
MemUse	Amount of memory in use, in kilobytes (KB).
HighUse	Maximum memory ever used by this type.
Limit	Maximum memory that can be allocated to this type.
Requests	Total number of dynamic memory allocation requests this type has made.
Type Limit	Number of times requests were blocked for reaching the maximum limit.
Kern Limit	Number of times requests were blocked for kernel map.
Size(s)	Memory block sizes this type is using.
Memory Totals	
In Use	Total kernel dynamic memory in use (bytes, rounded up).
Free	Total kernel dynamic memory free (bytes, rounded up).

Table 41: show system virtual-memory Output Fields *(continued)*

Field Name	Field Description
Requests	Total number of memory allocation requests.
ITEM	Kernel module that is using memory.
Size	Memory block size (bytes).
LImit	Maximum memory that can be allocated to this type.
Used	Number of memory blocks used by this type. The number is rounded up.
Free	Number of memory blocks available to this type.
Requests	Total number of memory allocation requests this type has made.
interrupt	Timer events and scheduling interruptions.
total	Total number of interruptions for each type.
rate	Interruption rate.
Total	Total for all interruptions.

show task replication

Syntax **show task replication**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Displays graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) status. When you issue this command on the master Routing Engine, the status of nonstop active routing synchronization is also displayed.

Options This command has no options.

Required Privilege Level view

List of Sample Output
show task replication (Issued on the Master Routing Engine) on page 295
show task replication (Issued on the Backup Routing Engine) on page 295

Output Fields Table 42 on page 295 lists the output fields for the **show task replication** command. Output fields are listed in the approximate order in which they appear.

Table 42: show task replication Output Fields

Field Name	Field Description
Stateful replication	Displays whether or not graceful Routing Engine switchover is configured. The status can be **Enabled** or **Disabled**.
RE mode	Displays the Routing Engine on which the command is issued: **Master**, **Backup**, or **Not applicable** (when the router has only one Routing Engine).
Protocol	Protocol that are supported by nonstop active routing.
Synchronization Status	Nonstop active routing synchronization status for the supported protocols. States are **NotStarted**, **InProgress**, and **Complete**.

show task replication (Issued on the Master Routing Engine)

```
user@host> show task replication
        Stateful Replication: Enabled
        RE mode: Master

    Protocol                Synchronization Status
    OSPF                    NotStarted
    BGP                     Complete
    IS-IS                   NotStarted
    LDP                     Complete
```

show task replication (Issued on the Backup Routing Engine)

```

PART 6

Junos OS for J-EX Series Switches Power Management

CHAPTER 18

Power Management Overview

Junos OS—Overview

J-EX Series Switch Software Features Overview

The following tables list the J-EX Series Switches software features and the Junos OS Release in which they were introduced:

Power Management

- Understanding Power Management on J-EX Series Switches on page 302

Understanding Power Management on J-EX Series Switches

The power management feature for Dell PowerConnect J-Series J-EX8200 Ethernet Switches helps ensure that normal operation of the system is not disrupted because of insufficient power to the switch. It does so by employing a power budget policy.

Power management does the following in its power budget policy:

- Budgets power for each switch component that requires power. The amount that power management budgets for each component is the maximum power that component might consume. For example, for the fan tray, power management budgets the amount of power required to run the fans at their maximum speed setting.
- Reserves a set amount of power for power supply redundancy. In its default configuration, power management manages the switch for N+1 power redundancy, which ensures uninterrupted system operation if one power supply fails. For example, if a switch has four online 3000 W power supplies, power management reserves 3000 W in its power budget policy for redundancy. It allocates the remaining 9000 W to normal operating power.
- Specifies the rules under which components receive power. These rules are designed to ensure the least disruption to switch operation under conditions of insufficient power. For example, power management provides power to core system components, such as the Routing Engine, before it provides power to line cards.

You can configure certain aspects of power management's budget policy, specifically:

- The power priority of individual line cards. By assigning different power priorities to the line cards, you can determine which line cards are more likely to receive power in the event of insufficient power.
- The power redundancy configuration. The default power redundancy configuration is N+1; you can optionally configure N+N. For example, if you have deployed two independent AC power feeds to the switch, configure N+N redundancy. When you configure power management for N+N redundancy, it reserves the appropriate amount of power in its power budget and reports insufficient power conditions accordingly.

These configurable items are discussed further in:

- Power Priority of Line Cards on page 303
- Power Supply Redundancy on page 304

Power Priority of Line Cards

Power management powers line cards on or off based on the power priority of the slots they occupy:

- When a switch powers on, power management provides power to the line cards in the order of their slot priority, with line cards in high priority slots receiving power first. Thus if available power (including redundant power) is exhausted before all line cards receive power, higher priority cards are powered on while lower priority cards remain powered off.
- If the switch starts receiving insufficient power because of power supply failure or some other problem, power management powers off the line cards in reverse-priority order until power (including redundant power) is sufficient for the remaining cards. Thus higher priority line cards are more likely to retain power in power shortage conditions than are lower priority line cards.
- Power management responds to changes in power availability and line card operating status by powering line cards on or off as appropriate. For example, if you add a power supply, lower priority cards that were powered off due to insufficient power are powered on in priority order.

  If you take a line card offline, power management no longer allocates power to it. If power to the switch is insufficient when you take a line card offline, power management allocates the freed power to a lower priority card that was offline due to lack of power and brings it online. Restarting a line card, however, does not affect the power allocated to it. Thus when power is insufficient, restarting a line card does not change its operating status or the operating status of other line cards.

NOTE: Because power management does not allocate power to an offline line card, a line card that has been taken offline in a J-EX8200 switch is not automatically brought online when you commit a configuration. You must explicitly bring the line card online with the **request chassis fpc slot** ***slot-number*** **online** command. This behavior differs from other platforms running the Junos OS, which automatically bring an offline FPC online when you commit a configuration.

The actual power priority of a slot is determined first by the slot's assigned priority and second by the slot's number. If more than one slot has the same assigned priority, power priority is determined by slot number, with the lowest-numbered slots receiving power first.

By default, all slots are assigned the lowest priority. You can assign a priority to a slot using the CLI. If you do not explicitly assign priorities to slots, the slots receive power in ascending order of slot numbers.

Because the purpose of power management is to ensure minimal system disruption when power is insufficient, slot power priority does not always determine which line cards receive power. In some cases, power management might provide power to a lower priority line card rather than a higher priority line card. For example:

- If power is insufficient for a line card in a higher priority slot but is sufficient for a line card in a lower priority slot, the lower priority slot receives the power. For example, if an 8-port SFP+ line card requiring 450 W is in a higher priority slot than a 48-port SFP line card requiring 330 W, the 48-port SFP line card receives the power if there is more than 330 W but less than 450 W available.
- In an operating switch that has insufficient power, power management does not power off operating line cards to provide power to a newly inserted line card or a line card that is brought online after being offline, even if the line card has a higher priority than the currently operating line cards.

  However, if you restart the switch, power management reruns the current power budget policy and powers line cards on or off based on their priority. As a result, line cards receive power strictly by priority order and previously operating line cards might no longer receive power.
- If you change the assigned power priority of line cards when there is insufficient power for all the line cards, power management does not power down line cards that had been receiving power because they are now a lower priority.

Power Supply Redundancy

By default, power management in J-EX8200 switches is configured to manage the power supplies for N+1 redundancy, in which one power supply is held in reserve for backup if one of the other power supplies is removed or fails.

You can configure power management to manage the power supplies for N+N redundancy. In N+N redundancy, power management holds N power supplies in reserve for backup. For example, if your switch has six power supplies and you configure N+N redundancy, power management makes three power supplies available for normal operating power and reserves three power supplies for redundancy (3+3). If you have an odd number of power supplies, power management allocates one more power supply to normal operating power than to redundant power. For example, if you have five power supplies, the N+N configuration is 3+2.

Given the same number of power supplies, an N+N configuration usually provides less normal operating power than an N+1 configuration because the N+N configuration holds more power in reserve for backup. Table 43 on page 304 shows the effect on normal operating power in N+1 and N+N configurations.

Table 43: Available Operating Power in N+1 and N+N Redundancy Configurations

Number of Power Supplies at *n* W Each	Normal Operating Power in N+1 Configuration	Normal Operating Power in N+N Configuration
2	1 x (*n* W)	1 x (*n* W)

Table 43: Available Operating Power in N+1 and N+N Redundancy Configurations *(continued)*

Number of Power Supplies at *n* W Each	Normal Operating Power in N+1 Configuration	Normal Operating Power in N+N Configuration
3	2 x (*n* W)	2 x (*n* W)
4	3 x (*n* W)	2 x (*n* W)
5	4 x (*n* W)	3 x (*n* W)
6	5 x (*n* W)	3 x (*n* W)

To compensate for the reduced normal operating power, power management reserves less power to the chassis in an N+N configuration than in an N+1 configuration. This reduction in reserved chassis power allows a switch in an N+N configuration to power more line cards than it could without the reduction. For the J-EX8208 switch, the power reserved for the chassis is reduced to 1200 W from 1600 W; for the J-EX8216 switch, it is reduced to 1800 W from 2400 W.

NOTE: To achieve the reduction in reserved chassis power, power management reduces the maximum fan speed to 60 percent in an N+N configuration from 80 percent in an N+1 configuration. Because the maximum fan speed is reduced, it is possible that a line card that overheats would be shut down sooner in an N+N configuration than in an N+1 configuration.

Power management automatically recalculates the redundant power and normal operating power as power supplies go online or offline. For example, if you have an N+N configuration with three online 2000 W power supplies, power management allocates 2000 W to redundant power. If you bring a fourth 2000 W power supply online, power management then allocates 4000 W to redundant power. If a power supply goes offline again, power management once again allocates 2000 W to redundant power.

When power is insufficient to meet the budgeted power requirements, power management raises alarms as follows:

- If all the line cards are receiving power but insufficient redundant power exists to maintain the configured N+1 or N+N power configuration, power management raises a minor (yellow) alarm. If this condition persists for 5 minutes, the alarm becomes a major (red) alarm.
- If one or more line cards are down because of insufficient power (including redundant power), power management raises a major (red) alarm.

Power management clears all alarms when sufficient power is available to meet normal operating and redundant power requirements.

CHAPTER 19

Initial Configuration

Configuring Power Supply Redundancy (CLI Procedure)

By default, the power management feature in J-EX8200 switches is configured to manage the power supplies for N+1 redundancy, in which one power supply is held in reserve for backup if any one of the other power supplies is removed or fails.

You can configure power management to manage the power supplies for N+N redundancy. For example, to set up your AC power supplies for dual power feed, N+N redundancy is required. In N+N redundancy, power management allocates half of the online power supplies to normal operating power and half to redundant power. If you have an odd number of online power supplies, power management allocates one more power supply to normal operating power than to redundant power.

This topic describes how to configure power management for N+N redundancy and how to revert back to N+1 redundancy if your deployment needs change.

Before you configure power management for N+N redundancy, ensure that you have sufficient power supplies to meet the power requirements of this configuration. Use the **show chassis power-budget-statistics** command to display your current power budget.

NOTE: To allow more power to be available to line cards, power management compensates for the reduced normal operating power in an N+N configuration by reserving less power to the chassis than it does in an N+1 configuration. For the J-EX8208 switch, the power reserved for the chassis is reduced to 1200 W from 1600 W. For the J-EX8216 switch, it is reduced to 1800 W from 2400 W. In determining whether you have enough power for an N+N configuration, take this reduction of reserved chassis power into account.

The reduction in reserved chassis power is achieved by reducing the maximum fan speed to 60 percent in an N+N configuration from 80 percent in an N+1 configuration. Because the maximum fan speed is reduced, it is possible that a line card that overheats would be shut down sooner in an N+N configuration than in an N+1 configuration.

To configure N+N redundancy:

```
[edit chassis]
user@switch# set psu redundancy n-plus-n
```

To revert back to N+1 redundancy:

```
[edit chassis]
user@switch# delete chassis psu redundancy n-plus-n
```

Configuring the Power Priority of Line Cards (CLI Procedure)

The power management facility on J-EX8200 switches allows you to assign power priorities to the slots occupied by line cards. Power management provides power to the slots in priority order, which means that line cards in higher priority slots are more likely to receive power than line cards in lower priority slots if power to the switch is insufficient to power all the line cards.

When assigning power priority to slots, keep these points in mind:

- 0 is the highest priority. For a J-EX8208 switch, you can assign a priority of 0 through 7 to a slot. For a J-EX8216 switch, you can assign a priority of 0 through 15 to a slot.
- All slots are assigned the lowest priority by default.
- If a group of slots shares the same assigned priority, each slot's power priority within the group is based on its slot number, with the lowest-numbered slots receiving power first.

To assign or change the power priority for a slot:

```
[edit chassis]
user@switch# set fpc slot power-budget-priority priority
```

For example, to set slot 6 to priority 0, enter:

```
[edit chassis]
user@switch# set fpc 6 power-budget-priority 0
```

CHAPTER 20

Verifying Power Management

Verifying Power Configuration and Use

Purpose Verify on a J-EX8200 switch:

- What the power redundancy and line card priority settings are
- Whether the N+1 or N+N power requirements are being met
- Whether the switch has sufficient power for a new line card or an N+N configuration

Action Enter the following command:

```
user@switch> show chassis power-budget-statistics
    PSU  1     (EX8200-AC2K)                 :    1200 W
    PSU  2     (EX8200-AC2K)                 :    1200 W
    PSU  3     (EX8200-AC2K)                 :    1200 W
    PSU  4     (EX8200-AC2K)                 :    1200 W
    Total Power supplied by all Online PSUs  :    4800 W
    Power Redundancy Configuration           :     N+N
    Power Reserved for the Chassis           :    1200 W
    FPC  5     (EX8200-48F )                 :     330 W    Priority: 7
    FPC  6     (EX8200-8XS )                 :     450 W    Priority: 0
    Actual Power Used                        :    1980 W
    Power Available (Redundant case)         :     420 W
    Total Power Available                    :    2820 W
```

Meaning The switch is configured for N+N redundancy. As shown by the **Power Available (Redundant case)** field, the switch has sufficient power to meet the N+N power requirements and has an additional 420 W available. The switch has insufficient power for an additional 8-port SFP+ line card while maintaining N+N redundancy, because the line card requires 450 W. However, it does have enough power for an additional 48-port SFP line card, which requires only 330 W. The 8-port SFP+ line card in slot 6 has a higher power priority than the 48-port SFP line card line card in slot 5.

NOTE: The amount of power shown in the **Actual Power Used** field reflects the total power allocated in the power budget for the installed components rather than the actual power being used by the components. Because the power budget allocation is based on maximum power use, actual power consumption is likely to be much less.

CHAPTER 21

Configuration Statements for Power Management

fpc

Syntax

```
fpc slot {
  pic pic-number {
    sfpplus {
      pic-mode mode;
    }
  }
  power-budget-priority priority;
```

Hierarchy Level [edit chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description On a J-EX4200 switch, specify the port of the SFP+ uplink module for which you want to configure the operating mode.

On a J-EX8200 switch, specify the line card slot for which you want to assign a power priority.

Options ***slot***—Number of the slot:

- 0—Standalone J-EX4200 switches. The FPC refers to the switch itself.
- 0–9—J-EX4200 switch in a Virtual Chassis configuration. The value corresponds to the switch's member ID.
- 0–7—J-EX8208 switch. The slot is a line card slot.
- 0–15—J-EX8216 switch. The slot is a line card slot.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Setting the Mode on an SFP+ Uplink Module (CLI Procedure) on page 921

n-plus-n

Syntax n-plus-n;

Hierarchy Level [edit **chassis psu redundancy**]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure N+N power supply redundancy for power management on a J-EX8200 switch.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring Power Supply Redundancy (CLI Procedure) on page 307

power-budget-priority

Syntax power-budget-priority *priority*;

Hierarchy Level [edit **chassis fpc** *slot*]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Assign a power priority to the specified line card slot on a J-EX8200 switch.

Default All line card slots are initially assigned the lowest priority.

Options ***priority***—Assigned power priority for the slot, with 0 being the highest priority.
Range: 0 through 7 for a J-EX8208 switch; 0 through 15 for a J-EX8216 switch

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring the Power Priority of Line Cards (CLI Procedure) on page 308

psu

Syntax

```
psu {
  redundancy {
    n-plus-n;
  }
}
```

Hierarchy Level [edit chassis]

Release Information Statement introduced in Junos OS Release 10.2 for J-EX Series switches.

Description Configure N+N power supply redundancy for power management on a J-EX8200 switch.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

List of Sample Output **show chassis power-budget-statistics on page 317**

Output Fields Table 44 on page 316 lists the output fields for the **show chassis power-budget-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 44: show chassis power-budget-statistics Output Fields

Field Name	Field Description
PSU *n* (*supply type*)	Number of watts supplied by the power supply. All installed power supplies, whether currently operating or not, are listed.
Power supplied by all Online PSUs	Total number of watts supplied by all currently operating power supplies.
Power Redundancy Configuration	Configured power redundancy setting, either N+1 or N+N.
Power Reserved for the Chassis	Power reserved for the chassis: • For a J-EX8208 switch: 1600 W in an N+1 configuration; 1200 W in an N+N configuration • For a J-EX8216 switch: 2400 W in an N+1 configuration; 1800 W in an N+N configuration The power reserved for the chassis includes the maximum power requirements for the fan tray and Switch Fabric and Routing Engine (SRE), Routing Engine (RE), and Switch Fabric (SF) modules in both base and redundant configurations.
FPC *n* (*card type*)	Number of watts required by the line card in slot *n* and the power priority assigned to the slot.
Actual Power Used	Power budgeted for all the components in the switch. This equal to the power reserved for the chassis plus the power requirements of all online line cards. Because the amount budgeted is based on maximum power requirements, the real power consumption of the switch is likely to be less than this figure.

Table 44: show chassis power-budget-statistics Output Fields *(continued)*

Field Name	Field Description
Power Available (Redundant case)	Unused power available to the switch in the power budget, excluding redundant power. If power is insufficient to meet the N+1 or N+N redundancy requirements, this value is 0.
Total Power Available	Unused power available to the switch in the power budget, including redundant power.

show chassis power-budget-statistics

```
user@switch> show chassis power-budget-statistics
    PSU  0     (EX8200-AC2K)                 :    2000 W
    PSU  1     (EX8200-AC2K)                 :    2000 W
    PSU  2     (EX8200-AC2K)                 :    2000 W
    Total Power supplied by all Online PSUs  :    6000 W
    Power Redundancy Configuration           :     N+N
    Power Reserved for the Chassis           :    1600 W
    FPC  6     (EX8200-8XS )                 :     450 W    Priority: 7
    Actual Power Used                        :    2050 W
    Power Available (Redundant case)         :    1950 W
    Total Power Available                    :    3950 W
```

PART 7

Junos OS for J-EX Series Switches Configuration Management

CHAPTER 23

Configuration Management Overview

Configuration Files—Overview

Understanding Configuration Files for J-EX Series Switches

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration. For more information, see “Configuration Files Terms” on page 322.

Junos OS saves the 50 most recently committed configuration files on the switch so that you can return to a previous configuration. The configuration files are named:

- **juniper.conf.gz**—The current active configuration.
- **juniper.conf.1.gz** to **juniper.conf.49.gz**—Rollback configurations.

To make changes to the configuration file, you have to work in the configuration mode in the CLI or use the configuration tools in the J-Web interface. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.

Configuration Files Terms

Table 45 on page 322 lists the various configuration file terms used for J-EX Series switches and their definitions.

Table 45: Configuration File Terms

Term	Definition
active configuration	The current committed configuration of a switch.
candidate configuration	A working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Have the candidate configuration checked for proper syntax, activated, and marked as the current configuration file running on the switching platform.
configuration hierarchy	The Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	The default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the J-Web interface or CLI.
roll back a configuration	Return to a previously committed configuration.

Understanding Automatic Refreshing of Scripts on J-EX Series Switches

You can automatically refresh **commit**, **event**, and **op** scripts using operational mode commands on J-EX Series switches. The commands are:

- **request system scripts refresh-from commit**
- **request system scripts refresh-from event**
- **request system scripts refresh-from op**

The existing Junos OS command-line interface (CLI) **refresh** and **refresh-from** configuration mode statements have been extended to work with Junos XML management protocol and NETCONF XML management protocol sessions.

Understanding Autoinstallation of Configuration Files on J-EX Series Switches

Autoinstallation is the automatic configuration of a device over the network from a pre-existing configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to automatically configure new devices and to deploy multiple devices from a central location in the network.

Autoinstallation takes place automatically when you connect an Ethernet port on a new switch to the network and power on the switch. You can also explicitly enable autoinstallation on J-EX Series Switches in your network to implement autoinstallation when they are powered on. To configure autointallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

This topic describes:

- Typical Uses for Autoinstallation on page 323
- Autoinstallation Configuration Files and IP Addresses on page 324
- Typical Autoinstallation Process on a New Switch on page 324

Typical Uses for Autoinstallation

- To deploy and update multiple devices from a central location in the network.
- To configure a new device—Autoinstallation takes place when you power on a device that has only the factory default configuration (boot) file.

- To update a device—Autoinstallation takes place when a device that has been manually configured for autoinstallation is powered on.

Autoinstallation Configuration Files and IP Addresses

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

- **network.conf**—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
- **switch.conf**—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
- ***hostname*.conf**—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, ***hostname*** is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, boot protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

Typical Autoinstallation Process on a New Switch

When a J-EX Series switch is powered on for the first time, it performs the following autoinstallation tasks:

1. The new switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.

   If a DHCP server responds to these requests, it provides the switch with some or all of the following information:

   - An IP address and subnet mask for the autoinstallation interface.
   - The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
   - The name of the configuration file to be requested from the TFTP server.
   - The IP address or hostname of the TFTP server.

     If the DHCP server provides the server's hostname, a DNS server must be available on the network to resolve the name to an IP address.
   - The IP address of an intermediate device if the configuration server is on a different LAN segment from the new switch.

2. After the new switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:

   a. If the DHCP server specifies the host-specific configuration file ***hostname*.conf**, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for ***hostname*.conf**. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.

   b. If the new switch does not locate a ***hostname*.conf** file, the autoinstallation process sends three unicast TFTP requests for a **network.conf** file that contains the switch's hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.

   c. If the switch fails to find a **network.conf** file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the new switch's IP address to a hostname.

   d. If the new switch determines its hostname, it sends a TFTP request for the ***hostname*.conf** file.

   e. If the new switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **switch.conf**. The TFTP request procedure is the same as for the **network.conf** file.

3. After the new switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.

J-EX Series Switches Default Configuration

- J-EX4200 Default Configuration on page 325
- J-EX8200 Switch Default Configuration on page 329

J-EX4200 Default Configuration

Each J-EX Series switch is programmed with a factory default configuration that contains the values set for each configuration parameter when a switch is shipped. The default configuration file sets values for system parameters such as **syslog** and **commit**; configures Power over Ethernet (PoE), storm control, and Ethernet switching on all interfaces; and enables the LLDP and RSTP protocols.

When you commit changes to the configuration, a new configuration file is created that becomes the active configuration. You can always revert to the factory default

configuration. See “Reverting to the Default Factory Configuration for the J-EX Series Switch” on page 341.

The following factory default configuration file is for a J-EX4200 switch with 24 ports (for models that have more ports, this default configuration file has more interfaces):

NOTE: In this example, ge-0/0/0 through ge-0/0/23 are the network interface ports. Optional uplink modules provide four 1-gigabit SFP transceivers (ge-0/1/0 through ge-0/1/3). Although you can install only one uplink module, the interfaces for both are shown below.

```
system {
    syslog {
        user * {
            any emergency;
        }
        file messages {
            any notice;
            authorization info;
        }
        file interactive-commands {
            interactive-commands any;
        }
    }
    commit {

J-EX8200 Switch Default Configuration

Each J-EX8200 switch is programmed with a factory default configuration that contains the values set for each configuration parameter when a switch is shipped. The default configuration file sets values for system parameters such as the ARP aging timer, the system log, and file messages, while also enabling the LLDP protocol, the RSTP protocol, IGMP snooping, and storm control.

When you commit changes to the configuration, a new configuration file is created that becomes the active configuration. You can always revert to the factory default configuration. See “Reverting to the Default Factory Configuration for the J-EX Series Switch” on page 341.

This topic shows the factory default configuration file of a J-EX8200 switch:

```
system {
  arp {
```

```
        aging-timer 5
        }
    }
    syslog {
        user * {
            any emergency;
        }
        file messages {
            any notice;
            authorization info;
        }
        file interactive-commands {

CHAPTER 24

Managing Junos OS Configuration

Using the Configuration Tools in J-Web

Using the CLI Viewer in the J-Web Interface to View Configuration Text

To view the entire configuration file contents in text format, select **Configure>CLI Tools >CLI Viewer**. The main pane displays the configuration in text format.

Each level in the hierarchy is indented to indicate each statement's relative position in the hierarchy. Each level is generally set off with braces, with an open brace ({) at the beginning of each hierarchy level and a closing brace (}) at the end. If the statement at a hierarchy level is empty, the braces are not displayed. Each leaf statement ends with a semicolon (;), as does the last statement in the hierarchy.

This indented representation is used when the configuration is displayed or saved as an ASCII file. However, when you load an ASCII configuration file, the format of the file is not so strict. The braces and semicolons are required, but the indention and use of new lines are not required in ASCII configuration files.

Related Documentation

- Understanding J-Web Configuration Tools on page 131

Using the CLI Editor in the J-Web Interface to Edit Configuration Text

Use the CLI Editor to edit configuration if you know the Junos OS CLI or prefer a command interface.

To edit the entire configuration in text format:

CAUTION: We recommend that you use this method to edit and commit the configuration only if you have experience editing configurations through the CLI.

1. Select **Configure>CLI Tools>CLI Editor**. The main pane displays the configuration in a text editor.
2. Navigate to the hierarchy level you want to edit.

   You can edit the candidate configuration using standard text editor operations—insert lines (by using the Enter key), delete lines, and modify, copy, and paste text.
3. Click **Commit** to load and commit the configuration.

   The switching platform checks the configuration for the correct syntax before committing it.

Related Documentation

- CLI User Interface Overview on page 127
- Understanding J-Web Configuration Tools on page 131

Using the Point and Click CLI Tool in the J-Web Interface to Edit Configuration Text

To edit the configuration on a series of pages of clickable options that steps you through the hierarchy, select **Configure>CLI Tools>Point&Click CLI**. The side pane displays the top level of the configured hierarchy, and the main pane displays configured hierarchy options and the Icon Legend.

To expand or hide the hierarchy of all the statements in the side pane, click **Expand all** or **Hide all**. To expand or hide an individual statement in the hierarchy, click the expand (+) or collapse (–) icon to the left of the statement.

TIP: Only those statements included in the committed configuration are displayed in the hierarchy.

The configuration information in the main pane consists of configuration options that correspond to configuration statements. Configuration options that contain subordinate statements are identified by the term *Nested*.

To include, edit, or delete statements in the candidate configuration, click one of the links described in Table 46 on page 332. Then specify configuration information by typing in a field, selecting a value from a list, or clicking a check box (toggle).

Table 46: J-Web Edit Point & Click Configuration Links

Link	Function
Add new entry	Displays fields and lists for a statement identifier, allowing you to add a new identifier to a statement.

Table 46: J-Web Edit Point & Click Configuration Links *(continued)*

Link	Function
Configure	Displays information for a configuration option that has not been configured, allowing you to include a statement.
Delete	Deletes the corresponding statement or identifier from the configuration. All subordinate statements and identifiers contained within a deleted statement are also discarded.
Edit	Displays information for a configuration option that has already been configured, allowing you to edit a statement.
Identifier	Displays fields and lists for an existing statement identifier, allowing you to edit the identifier.

As you navigate through the configuration, the hierarchy level is displayed at the top of the main pane. You can click a statement or identifier in the hierarchy to display the corresponding configuration options in the main pane.

The main pane includes icons that display information about statements and identifiers when you place your cursor over them. Table 47 on page 333 describes these icons.

Table 47: J-Web Edit Point & Click Configuration Icons

Icon	Function
C	Displays a comment about a statement.
I	Indicates that a statement is inactive.
M	Indicates that a statement has been added or modified but has not been committed.
*	Indicates that the statement or identifier is required in the configuration.
?	Provides online help information.

After typing or selecting your configuration edits, click a button in the main pane (described in Table 48 on page 333) to apply your changes or cancel them, refresh the display, or discard parts of the candidate configuration. An updated configuration does not take effect until you commit it.

Table 48: J-Web Edit Point & Click Configuration Buttons

Button	Function
Refresh	Updates the display with any changes to the configuration made by other users.
Commit	Verifies edits and applies them to the current configuration file running on the switch.
Discard	Removes edits applied to or deletes existing statements or identifiers from the candidate configuration.

Using the Commit Options to Commit Configuration Changes (J-Web Procedure)

You can use the single-commit feature to commit all outstanding configuration changes in the J-Web interface on J-EX Series switches simultaneously. This helps in reducing the time J-Web takes for committing configurations because when changes are committed at every step, rollback configurations pile up.

For example, suppose you want to delete a firewall filter and add a new one. With immediate commits, you would need to commit your changes twice for this action. Using single commit, you can decrease the number of commits to one, thus saving time for working on other configurations.

When you edit a configuration, you work on a copy of the current configuration, which is your candidate configuration. The changes you make to the candidate configuration are visible through the user interface immediately, allowing other users to edit those configurations, but they do not take effect on the switch until you commit the changes. When you commit the configuration, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration when you commit the candidate configuration, changes made by all users take effect.

You can configure the commit options to either commit all configuration changes together or commit each configuration change immediately using the J-Web Commit Preference page.

NOTE: There are some pages on which configuration changes must be committed immediately. For such pages, if you configure the commit options for a single commit, the system displays warning notifications that remind you to commit your changes immediately. An example of such a page is the Interface Page (**Configure** > **Interface**).

To configure the commit options on a J-EX Series switch using the J-Web interface:

1. Select **Commit Options**.

   

   NOTE: All action links except **Preference** are disabled unless you edit, add, or delete a configuration.

2. Choose an action. See Table 49 on page 335 for details on the actions.
3. Configure the commit options by selecting **Preference**. See Table 50 on page 335 for details on preference options.

Table 49: Commit Options

Menu Item	Function	Your Action
Commit	Commits the candidate configuration of the current user session, along with changes from other user sessions.	1. Select **Commit Options** > **Commit**. Changes are committed after the system validates your configuration. A window displays that the configuration was successfully committed or that the commit failed. 2. Click **OK**. Click **Details** to view the commit log.
Compare	Displays the XML log of pending uncommitted configurations on the device.	1. Select **Commit Options** > **Compare**. The XML log of pending configurations on the devices are displayed similar to the CLI interface, in a "human-readable" form. 2. Click **Close**.
Discard	Discards the candidate configuration of your current session, along with changes from other user sessions.	1. Select **Commit Options** > **Discard**. 2. Click **OK** to confirm the discard action. Your changes are discarded after the system validates your configuration.
Preference	Indicates your choice of committing all global configurations together or committing each configuration change immediately.	1. Select **Commit Options** > **Preference**. The Commit Preference page is displayed. 2. Configure the commit options by selecting your preference. See Table 50 on page 335 for details on preference options.

Table 50: Commit Preference Options

Option	Function
Validate and commit configuration changes	Sets the system to validate and force an immediate commit on every screen after every configuration change.
Validate configuration changes	Loads all the configuration changes for an accumulated single commit. If there are errors in loading the configuration, the errors are logged. This is the default mode. Once you select this option, you need to select **Commit Options** > **Commit** to commit your changes.

Managing Junos OS Configuration

- Uploading a Configuration File (CLI Procedure) on page 336
- Uploading a Configuration File (J-Web Procedure) on page 337

Uploading a Configuration File (CLI Procedure)

You can create a configuration file on your local system, copy the file to the J-EX Series switch and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file see *Junos OS System Basics and Services Command Reference* at http://www.juniper.net/techpubs/software/junos/.
2. In the configuration text file, use an option to perform the required action when the file is loaded. Table 51 on page 336 lists and describes some options for the **load** command.

Table 51: Options for the load command

Options	Description
merge	Combines the current active configuration and the configuration in *filename* or the one that you type at the terminal. A **merge** operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.
override	Discards the current candidate configuration and loads the configuration in *filename* or the one that you type at the terminal. When you use the **override** option and commit the configuration, all system processes reparse the configuration. You can use the **override** option at any level of the hierarchy.
replace	Searches for the **replace** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds the statements marked with the **replace** tag to the active configuration. NOTE: For this operation to work, you must include **replace** tags in the text file or in the configuration you type at the terminal.

3. Press Ctrl+A to select all the text in the configuration file.
4. Press Ctrl+C to copy the contents of the configuration text file to the Clipboard.

5. Log in to the switch using your username and password.
6. To enter configuration mode:
   user@switch> configure

   You will see this output, with the hash or pound mark indicating configuration mode.
   Entering configuration mode
   [edit]
   user@switch#
7. Load the configuration file:
   [edit]
   user@switch# load merge terminal
8. At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:
   [edit]
   user@switch# load merge terminal
   [Type ^D at a new line to end input]
   >Cursor is here. Paste the contents of the clipboard here<
9. Press Enter.
10. Press Ctrl+D to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt.You can also edit the configuration interactively using the CLI and commit it at a later time.

Related Documentation

Uploading a Configuration File (J-Web Procedure)

You can create a configuration file on your local system, copy the file to the J-EX Series switch and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Select **Maintain > Config Management > Upload**.

   The main pane displays the File to Upload box.
2. Specify the name of the file to upload using one of the following methods:
   - Type the absolute path and filename in the File to Upload box.
   - Click **Browse** to navigate to the file.
3. Click **Upload and Commit** to upload and commit the configuration.

The switch checks the configuration for the correct syntax before committing it.

Managing Configuration Files Through the Configuration History (J-Web Procedure)

Use the Configuration History function to manage configuration files.

1. Displaying Configuration History on page 338
2. Displaying Users Editing the Configuration on page 339
3. Comparing Configuration Files with the J-Web Interface on page 339
4. Downloading a Configuration File with the J-Web Interface on page 340
5. Loading a Previous Configuration File with the J-Web Interface on page 340

Displaying Configuration History

To manage configuration files with the J-Web interface, select **Maintain > Config Management >History**. The main pane displays History — Database Information page.

Table 52 on page 338 summarizes the contents of the display.

The configuration history display allows you to:

- View a configuration.
- Compare two configurations.
- Download a configuration file to your local system.
- Roll back the configuration to any of the previous versions stored on the switch.

Table 52: J-Web Configuration History Summary

Field	Description
Number	Version of the configuration file.
Date/Time	Date and time the configuration was committed.
User	Name of the user who committed the configuration.
Client	Method by which the configuration was committed: • **cli**—A user entered a Junos OS CLI command. • **junoscript**—A Junos XML protocol client performed the operation. Commit operations performed by users through the J-Web interface are identified in this way. • **snmp**—An SNMP **set** request started the operation. • **other**—Another method was used to commit the configuration.
Comment	Comment.

Table 52: J-Web Configuration History Summary *(continued)*

Field	Description
Log Message	Method used to edit the configuration: • Imported via paste— Configuration was edited and loaded with the **Configure>CLI Tools>Edit Configuration Text** option. • Imported upload [*filename*]—Configuration was uploaded with the **Configure>CLI Tools>Point Click Editor** option. • Modified via J–Web Configure — Configuration was modified with the J-Web Configure menu. • Rolled back via *user-interface*— Configuration was rolled back to a previous version through the user interface specified by *user-interface*, which can be Web Interface or CLI.
Action	Action to perform with the configuration file. The action can be **Download** or **Rollback**.

Displaying Users Editing the Configuration

To display a list of users editing the switching platform configuration, select **Config Management >History**. The list is displayed as Database Information in the main pane. Table 53 on page 339 summarizes the Database Information display.

Table 53: J-Web Configuration Database Information Summary

Field	Description
User Name	Name of user editing the configuration.
Start Time	Time of day the user logged in to the switch.
Idle Time	Elapsed time since the user issued a configuration command from the CLI.
Terminal	Terminal on which the user is logged in.
PID	Process identifier assigned to the user by the switching platform.
Edit Flags	Designates a private or exclusive edit.
Edit Path	Level of the configuration hierarchy that the user is editing.

Comparing Configuration Files with the J-Web Interface

To compare any two of the past 50 committed configuration files:

1. Select **Config Management >History**. A list of the current and the previous 49 configurations is displayed as Configuration History in the main pane.
2. Select the check boxes to the left of the two configuration versions you want to compare.
3. Click **Compare**.

   The main pane displays the differences between the two configuration files at each hierarchy level as follows:

- Lines that have changed are highlighted side by side in green.
- Lines that exist only in the more recent configuration file are displayed in red on the left.
- Lines that exist only in the older configuration file are displayed in blue on the right.

Downloading a Configuration File with the J-Web Interface

To download a configuration file from the switch to your local system:

1. Select **Config Management >History**. A list of current and previous 49 configurations is displayed as Configuration History in the main pane.
2. In the Action column, click **Download** for the version of the configuration you want to download.
3. Select the options your Web browser provides that allow you to save the configuration file to a target directory on your local system.

   The file is saved as an ASCII file.

Loading a Previous Configuration File with the J-Web Interface

To load (roll back) and commit a previous configuration file stored on the switching platform:

1. Select **Config Management >History**. A list of current and previous 49 configurations is displayed as Configuration History in the main pane.
2. In the Action column, click **Rollback** for the version of the configuration you want to load.

   The main pane displays the results of the rollback operation.

NOTE: When you click Rollback, the switch loads and commits the selected configuration. This behavior is different from the switch's behavior that occurs after you enter the rollback configuration mode command from the CLI. In the latter case, the configuration is loaded but not committed.

Related Documentation

- Loading a Previous Configuration File (CLI Procedure) on page 340
- Understanding Configuration Files for J-EX Series Switches on page 321
- Understanding J-Web Configuration Tools on page 131

Loading a Previous Configuration File (CLI Procedure)

You can return to a previously committed configuration file if you need to revert to a previous configuration. The J-EX Series switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback <*number*>

Options

- **none**— Return to the most recently saved configuration.
- ***number***—Configuration to return to.
  - **Range**: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default**: 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuation):

   ```
   [edit]
   user@switch# rollback 1
   load complete
   ```

2. Activate the configuration you have loaded:

   ```
   [edit]
   user@switch# commit
   ```

Related Documentation

- Managing Configuration Files Through the Configuration History (J-Web Procedure) on page 338
- Configuration Files Terms on page 322
- For more information on **rollback**, see the *Junos OS CLI User Guide* at http://www.juniper.net/techpubs/software/junos/ .

Reverting to the Default Factory Configuration for the J-EX Series Switch

If for any reason the current active configuration fails, you can revert to the default factory configuration. You can also roll back to a previous configuration, as described in "Loading a Previous Configuration File (CLI Procedure)" on page 340, or revert to the rescue configuration, as described in "Reverting to the Rescue Configuration for the J-EX Series Switch" on page 343.

The default factory configuration contains the basic configuration settings. This is the first configuration of the switch and it is loaded when the switch is first installed and powered on.

You can revert to the default factory configuration by using the **Menu** button to the right of the LCD on the front panel of the switch or by using the **load factory default** configuration command.

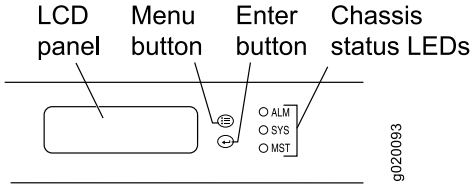
- Reverting to the Default Factory Configuration by Using the LCD Panel on page 342
- Reverting to the Default Factory Configuration by Using the Load Factory Default Command on page 342

Reverting to the Default Factory Configuration by Using the LCD Panel

To set the switch to the default factory configuration, use the LCD panel and buttons on the front panel of the switch as shown in Figure 5 on page 342. If the switch model does not have an LCD panel, use the CLI command described in the following section.

Use the LCD panel to revert to the default factory configuration if you want to run EZsetup. When you use the CLI to revert to the default factory configuration, the configuration for the root password is retained and you cannot run EZSetup.

Figure 5: J-EX Series Switch LCD Panel



NOTE: If you want to convert a J-EX4200 switch from a member of a multimember Virtual Chassis configuration to a standalone switch, first disconnect the cables connected to the Virtual Chassis ports (VCPs). See Disconnecting a Virtual Chassis Cable from a J-EX4200 Switch. The Menu button procedure deletes all modified configuration parameters, including Virtual Chassis parameters such as member ID, mastership priority, and setting of VCP uplinks.

1. Press the **Menu** button until you see MAINTENANCE MENU on the panel.
2. Press the **Enter** button.
3. Press **Menu** until you see FACTORY DEFAULT.
4. Press **Enter**. The display says RESTORE DEFAULT?
5. Press **Enter**. The screen flashes **FACTORY DEFAULT IN PROGRESS** and returns to the idle menu.

Reverting to the Default Factory Configuration by Using the Load Factory Default Command

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

Use the LCD panel to revert to the default factory configuration if you want to run EZsetup. When you use the CLI to revert to the default factory configuration, the configuration for the root password is retained and you cannot run EZSetup.

NOTE: The **load factory default** command by itself is not supported on J-EX4200 switches configured in a Virtual Chassis with multiple members. In a multimember Virtual Chassis configuration, you can revert to the default factory configuration while retaining the Virtual Chassis parameters (member ID, mastership priority, or settings of VCP uplinks) using the following procedure:

1. [edit]
   user@switch# **load factory default**
2. [edit]
   user@switch# **delete system commit factory-settings**
3. [edit]
   user@switch# **commit**
4. Check the member ID and mastership priority with the **show virtual-chassis status** command and check to see whether there are remaining settings for uplink VCPs by using the **show virtual-chassis vc-port** command.

- For more information about the **load factory default** command see the *Junos OS CLI User Guide* at http://www.juniper.net/techpubs/software/junos/.

Reverting to the Rescue Configuration for the J-EX Series Switch

If someone inadvertently commits a configuration that denies management access to a J-EX Series switch and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration by using the LCD panel on the switch. The rescue configuration is a previously committed, valid configuration.

You can also revert to the default factory configuration, as described in "Reverting to the Default Factory Configuration for the J-EX Series Switch" on page 341.

Before you begin to revert to the rescue configuration:

- Ensure that you have physical access to the switch.
- A rescue configuration for the switch must have been previously set.

To revert the switch to the rescue configuration:

1. At the LCD panel on the switch, press **Menu** until you see **MAINTENANCE MENU**.
2. Press **Enter**.
3. Press **Menu** until you see **Load Rescue**.
4. Press **Enter**.
5. When **Commit Rescue** is displayed, press **Enter**.

   The LCD panel displays the message **Commit Rescue in Progress**. When the reversion is complete, it displays the idle menu.

NOTE: If there is no rescue configuration saved on the switch, the message Commit rescue failed is displayed.

Related Documentation

- Setting or Deleting the Rescue Configuration (CLI Procedure) on page 344
- Setting or Deleting the Rescue Configuration (J-Web Procedure) on page 345
- LCD Panel in J-EX4200 Switches
- LCD Panel in a J-EX8200 Switch
- Configuration Files Terms on page 322

Setting or Deleting the Rescue Configuration (CLI Procedure)

A rescue configuration is a well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the J-Web interface or CLI.

If someone inadvertently commits a configuration that denies management access to a J-EX Series switch and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration by using the LCD panel on the switch. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

Configuring Autoinstallation of Configuration Files (CLI Procedure)

Autoinstallation is the automatic configuration of a device over the network from a pre-existing configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to automatically configure new devices and to deploy multiple devices from a central location in the network.

No configuration is required on a new switch (a switch that has the factory default configuration file), because it is an automated process. However, to specify autoinstallation to run when you power on a switch already installed in your network, you can enable it by specifying one or more interfaces, protocols, and configuration servers to be used for autoinstallation.

Before you explicitly enable and configure autoinstallation on the switch, perform these tasks as needed for your network's configuration:

- Have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch
- Configure a DHCP server on your network to meet your network requirements. You can configure a J-EX Series switch to operate as a DHCP server. For more information, see “Configuring DHCP Services (J-Web Procedure)” on page 447.
- Create one of the following configuration files, and store it on a TFTP server (or HTTP server or FTP server) in the network:
  - A host-specific file with the name ***hostname*.conf** for each switch undergoing autoinstallation. Replace ***hostname*** with the name of a switch. The ***hostname*.conf** file typically contains all the configuration information necessary for the switch with this hostname.
  - A default configuration file named **switch.conf** with the minimum configuration necessary to enable you to telnet into the new switch for further configuration.
- Physically attach the switch to the network using a Gigabit Ethernet port.
- If you configure the DHCP server to provide only the TFTP server hostname, add an IP address-to-hostname mapping entry for the TFTP server to the DNS database file on the Domain Name System (DNS) server in the network.
- If the new switch is not on the same network segment as the DHCP server (or other device providing IP address resolution), configure an existing device as an intermediate device to receive TFTP and DNS requests and forward them to the TFTP server and the DNS server. You must configure the LAN or serial interface on the intermediate device with the IP addresses of the hosts providing TFTP and DNS services. Connect this interface to the new switch.
- If you are using ***hostname*.conf** files for autoinstallation, you must also complete the following tasks:
  - Configure the DHCP server to provide a ***hostname*.conf** filename to each new switch. Each switch uses its ***hostname*.conf** filename to request a configuration file from the TFTP server. Copy the necessary ***hostname*.conf** configuration files to the TFTP server.
  - Create a default configuration file named **network.conf**, and copy it to the TFTP server. This file contains IP-address-to-hostname mapping entries. If the DHCP server does not send a ***hostname*.conf** filename to a new switch, the switch uses **network.conf** to resolve its hostname based on its IP address.

    Alternatively, you can add the IP-address-to-hostname mapping entry for the new switch to a DNS database file.

    The switch uses the hostname to request a ***hostname*.conf** file from the TFTP server.

To configure autoinstallation:

1. Specify the URL address of one or more servers from which to obtain configuration files.

```
[edit system]
user@switch# set autoinstallation configuration-servers tftp://tftpconfig.sp.com
```

NOTE: You can also use an FTP address, for example, ftp://*user*:*password*@sftpconfig.sp.com.

2. Configure one or more Ethernet interfaces to perform autoinstallation and one or two procurement protocols for each interface. The switch uses the protocols to send a request for an IP address for the interface:

```
[edit system]
user@switch# set autoinstallation interfaces ge-0/0/0 bootp
```

Verifying Configuration

Verifying Autoinstallation Status on a J-EX Series Switch

Purpose Display the status of the autoinstallation feature on a J-EX Series switch.

Action From the CLI, enter the **show system autoinstallation status** command.

Sample Output

```
user@switch> show system autoinstallation status
Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 10.25.100.1
Interface:
  Name: ge-0/0/0
  State: Configuration Acquisition
  Acquired:
    Address: 192.168.124.75
    Hostname: host-ge-000
    Hostname source: DNS
    Configuration filename: switch-ge-000.conf
    Configuration filename server: 10.25.100.3
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
Interface:
  Name: ge-0/0/1
  State: None
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
```

Meaning The output shows the settings configured for autoinstallation. Verify that the values displayed are correct for the switch when it is deployed on the network.

CHAPTER 26

Configuration Statements for Configuration Management

archival

Syntax

```
archival {
  configuration {
    archive-sites {
      ftp://username:<password>@<host>:<port>/<url-path>;
      scp://<username>:<password>@<host>:<port>/<url-path>;
    }
    transfer-interval interval;
    transfer-on-commit;
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure copying of the currently active configuration to an archive site.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site

archive-sites (Configuration File)

Syntax

```
archive-sites {
    file://<path>/<filename>;
    ftp://username@host:<port>url-path password password;
    http://username@host:<port>url-path password password;
    scp://username@host:<port>url-path password password;
}
```

Hierarchy Level [edit system archival **configuration**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([ ]). For example, **"scp://*username*<:*password*>@[*ipv6-host-address*]<:*port*>/*url-path*"**

If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails. The format for the destination filename is ***router-name*_juniper.conf[.gz]_*YYYYMMDD_HHMMSS***.

NOTE: The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site
- **configuration on page 355**
- **transfer-on-commit on page 358**

autoinstallation

Syntax

```
autoinstallation {
  configuration-servers {
    url;
  }
  interfaces {
    interface-name {
      bootp;
      rarp;
    }
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Download a configuration file automatically from an FTP, Hypertext Transfer Protocol (HTTP), or Trivial FTP (TFTP) server. When you power on a router or switch configured for autoinstallation, it requests an IP address from a Dynamic Host Configuration Protocol (DHCP) server. Once the router or switch has an address, it sends a request to a configuration server and downloads and installs a configuration.

Options The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Upgrading Software Using Automatic Software Download on J-EX Series Switches on page 82
- **configuration-servers on page 356**
- **idle-timeout on page 418**

commit synchronize

Syntax commit synchronize;

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For devices with multiple Routing Engines only. Configure a **commit** command to automatically result in a **commit synchronize** command. The Routing Engine on which you execute the **commit** command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engines. All Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on all Routing Engines.

Accounting of events and operations on a backup Routing Engine is not supported on accounting servers such as TACACS+ or RADIUS. Logging of accounting events is supported only for events and operations on a master Routing Engine.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring Multiple Routing Engines to Synchronize Committed Configurations Automatically

configuration

Syntax

```
configuration {
  transfer-interval interval;
  transfer-on-commit;
  archive-sites {
    file://<path>/<filename>;
    ftp://<username>:<password>@<host>:<port>/<url-path> password password;
    http://username@host:<port>url-path password password;
    scp://username@host:<port>url-path password password;
  }
}
```

Hierarchy Level [edit system archival]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch to transfer its currently active configuration by means of FTP periodically or after each commit.

Options The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site
- **archive on page 560**
- **transfer-interval on page 358**
- **transfer-on-commit on page 358**

configuration-servers

Syntax

```
configuration-servers {
  url;
}
```

Hierarchy Level [edit system **autoinstallation**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only, configure the URL address of a server from which to obtain configuration files. Examples of URLs:

tftp://*hostname/path/filename*

ftp://*username:prompt@ftp.hostname.net/filename /*

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **autoinstallation on page 353**
- **idle-timeout on page 418**

interfaces

Syntax

```
interfaces {
  interface-name {
    bootp;
    rarp;
    slarp;
  }
}
```

Hierarchy Level [edit system **autoinstallation**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Configure the interface on which to perform autoinstallation. A request for an IP address is sent from the interface. Specify the IP address procurement protocol.

Options **bootp**—Send requests over serial interfaces with Frame Relay.

rarp—Send requests over Ethernet interfaces.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

transfer-interval (Configuration)

Syntax transfer-interval *interval*;

Hierarchy Level [edit system archival configuration]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the switch to periodically transfer its currently active configuration to an archive site.

Options ***interval***—Interval at which to transfer the current configuration to an archive site.
Range: **15** through **2880** minutes

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- **archive on page 560**
- **configuration on page 355**
- **transfer-on-commit on page 358**

transfer-on-commit

Syntax transfer-on-commit;

Hierarchy Level [edit system archival configuration]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (“ ”) and enclose the IPv6 host address in brackets ([ ]). For example, “ftp://*username*<:*password*>@[*ipv6-host-address*]<:*port*>/*url-path*”

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

CHAPTER 27

Operational Mode Commands for Configuration Management

clear log

Syntax clear log *filename*
<all>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Remove contents of a log file.

Options *filename*—Name of the specific log file to truncate.

all—(Optional) Truncate the specified log file and delete all archived versions of it.

Required Privilege Level clear

Related Documentation
- **show log on page 657**

List of Sample Output **clear log on page 360**

Output Fields See **file list** for an explanation of output fields.

clear log The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
--------------------------------------------------------------------------
-rw-r-----  1 root  wheel      26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
--------------------------------------------------------------------------

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
--------------------------------------------------------------------------
-rw-r-----  1 root  wheel         57 Sep 15 03:44 /var/log/sampled
total 1
```

clear system commit

Syntax clear system commit

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear any pending commit operation.

Options This command has no options.

Required Privilege Level maintenance (or the actual user who scheduled the commit)

Related Documentation
- show system commit on page 381

List of Sample Output
clear system commit on page 361
clear system commit (None Pending) on page 361
clear system commit (User Does Not Have Required Privilege Level) on page 361

Output Fields When you enter this command, you are provided feedback on the status of your request.

clear system commit

```
user@host> clear system commit
Pending commit cleared.
```

clear system commit (None Pending)

```
user@host> clear system commit
No commit scheduled.
```

clear system commit (User Does Not Have Required Privilege Level)

```
user@host> clear system commit
error: Permission denied
```

file archive

Syntax file archive destination *destination* source *source* <compress>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.

Options

destination *destination*—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:

- For archived files—The suffix **.tar**
- For archived and compressed files—The suffix **.tgz**

source *source*—Source of the original file or files. Specify the source as a URL or filename.

compress—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix **.tgz**.

Required Privilege Level maintenance

List of Sample Output

file archive (Multiple Files) on page 362
file archive (Single File) on page 362
file archive (with Compression) on page 363

Output Fields When you enter this command, you are provided feedback on the status of your request.

file archive (Multiple Files) The following sample command archives all message files in the local directory **/var/log/messages** as the single file **messages-archive.tar** in the same directory:

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.

user@host>
```

file archive (Single File) The following sample command archives one message file in the local directory **/var/log/messages** as the single file **messages-archive.tar** in the same directory:

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz** in the same directory:

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.

user@host>
```

file checksum md5

Syntax file checksum md5 <*pathname*> *filename*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Calculate the Message Digest 5 (MD5) checksum of a file.

Options *pathname*—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the MD5 checksum.

Required Privilege Level maintenance

- **op on page 207**

List of Sample Output **file checksum md5 on page 364**

Output Fields When you enter this command, you are provided feedback on the status of your request.

file checksum md5

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

file checksum sha1

Syntax file checksum sha1 <*pathname*> *filename*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.

Options *pathname*—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the SHA-1 checksum.

Required Privilege Level maintenance

Related Documentation

- **op on page 207**

List of Sample Output **file checksum sha1 on page 365**

Output Fields When you enter this command, you are provided feedback on the status of your request.

file checksum sha1

```
user@host> file checksum sha1 /var/db/scripts/opscript.slax

SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

file checksum sha-256

Syntax file checksum sha-256 <*pathname*> *filename*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.

Options *pathname*—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the SHA-256 checksum.

Required Privilege Level maintenance

Output Fields When you enter this command, you are provided feedback on the status of your request.

file checksum sha-256

```
user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

file compare

Syntax
file compare (files *filename filename*)
< context | unified>
<ignore-white-space >

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Compare two local files and describe the differences between them in default, context, or unified output styles:

- **Default**—In the first line of output, **c** means lines were changed between the two files, **d** means lines were deleted between the two files, and **a** means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (**<**) in front of output lines refers to the first file. A right angle bracket (**>**) in front of output lines refers to the second file.
- **Context**—Display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (**!**) have changed. Additions are marked with a plus sign (**+**), and deletions are marked with a minus sign (**-**).
- **Unified**—Display is preceded by the line number from the first and the second file (*xx*,*xxx*,*x*). Before the line number, additions to the file are marked with a plus sign (**+**), and deletions to the file are marked with a minus sign (**-**). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.

Options
files *filename*—Names of two local files to compare.

context—(Optional) Display output in context format.

ignore-white-space—(Optional) Ignore changes in amount of white space.

unified—(Optional) Display output in unified format.

Required Privilege Level
none

List of Sample Output
file compare files on page 368
file compare files context on page 368
file compare files unified on page 368
file compare files unified ignore-white-space on page 369

Output Fields
When you enter this command, you are provided feedback on the status of your request.

file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<             full-name "File 1";

file copy

Syntax

file copy *source destination*
<source-address *address*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Copy files from one place to another on the local router or switch or between the local router or switch and a remote system.

Options

source—Source of the original file. Specify this as a URL or filename.

destination—Destination of the copied file. Specify this as a URL or filename. If you are copying a file to the current directory (your home directory on the local router or switch) and are not renaming the file, specify the destination with a period (.).

source-address *address*—(Optional) Source IP host address. This option is useful for specifying the source address of a secure copy (scp) file transfer.

Required Privilege Level

maintenance

List of Sample Output

file copy (A File from the Router to a PC) on page 370
file copy (A Configuration File Between Routing Engines) on page 370
file copy (A Log File Between Routing Engines) on page 370

Output Fields

When you enter this command, you are provided feedback on the status of your request.

file copy (A File from the Router to a PC)

```
user@host> file copy /var/tmp/rpd.core.4 berry:/c/junipero/tmp

...transferring.file..... |          0 KB |   0.3 kB/s | ETA: 00:00:00 | 100%
```

file copy (A Configuration File Between Routing Engines)

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host>  file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

file copy (A Log File Between Routing Engines)

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassisd lcc0-re1:/var/tmp
```

file delete

Syntax
file delete *filename*
<purge>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Delete a file on the local router or switch.

Options
filename—Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.

purge—(Optional) Overwrite regular files before deleting them.

Required Privilege Level
maintenance

List of Sample Output
file delete on page 371
file delete (Routing Matrix) on page 371

Output Fields
When you enter this command, you are provided feedback on the status of your request.

file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file list

Syntax
file list
<detail | recursive>
<*filename*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display a list of files on the local router or switch.

Options
none—Display a list of all files for the current directory.

detail | recursive—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.

filename—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.

Additional Information
The default directory is the home directory of the user logged into the router or switch. To view available directories, enter a space and then a backslash (/) after the **file list** command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the **file list** command.

Required Privilege Level
maintenance

List of Sample Output
file list on page 372

Output Fields
When you enter this command, you are provided feedback on the status of your request.

file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

file rename

Syntax file rename *source destination*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Rename a file on the local router or switch.

Options *destination*—New name for the file.

source—Original name of the file. For a routing matrix, the filename must include the chassis information.

Required Privilege Level maintenance

List of Sample Output **file rename on page 373**

Output Fields When you enter this command, you are provided feedback on the status of your request.

file rename The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core

file show

Syntax file show *filename*
<encoding base64>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the contents of a file.

Options *filename*—Name of a file. For a routing matrix, the filename must include the chassis information.

encoding base64—(Optional) Encode file contents.

Required Privilege Level maintenance

List of Sample Output file show on page 375

Output Fields When you enter this command, you are provided feedback on the status of your request.

file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
...
```

request system configuration rescue delete

Syntax request system configuration rescue delete

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Delete an existing rescue configuration.

Options This command has no options.

Required Privilege Level maintenance

Related Documentation

- request system configuration rescue save on page 377
- request system software rollback on page 113
- show system commit on page 381

request system configuration rescue save

```
user@host> request system configuration rescue save
```

request system scripts refresh-from commit

Syntax **request system scripts refresh-from commit file *file-name* url *url-path***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Automatically download the initial Junos OS configuration and a set of standard commit scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:

```
<request-script-refresh-from>
   <type>commit</type>
   <file>file-name></file>
   <URL>URL</URL>
</request-script-refresh-from>
```

Options file *file-name*—Name of the file to be downloaded.

url *url-path*—URL of the file to be downloaded.

Required Privilege Level maintenance

show system commit (Rollback Pending) on page 382

Output Fields Table 54 on page 381 describes the output fields for the **show system commit** command. Output fields are listed in the approximate order in which they appear.

Table 54: show system commit Output Fields

Field Name	Field Description
Commit History	Displays the last 50 commit operations listed, most recent to first. The identifier **rescue** designates a configuration created for recovery using the **request system configuration rescue save** command.
Timestamp	Date and time of the commit operation.
User name	User who executed the commit operation
Commit method	Method used to execute the commit operation: • **cli**—CLI interactive user performed the commit operation. • **junoscript**—Junos XML protocol client performed the commit operation. • **synchronize**—The **commit synchronize** command was performed on the other Routing Engine. • **snmp**—An SNMP SET request caused the commit operation. • **button**—A button on the router or switch was pressed to commit a rescue configuration for recovery. • **autoinstall**—A configuration obtained through autoinstallation was committed. • **other**—A method other than those identified was used to perform the commit operation.

show system commit

                }
            }
            services {
                ftp;
                rlogin;
                rsh;
                telnet;
            }
        }
    }
....
```

show system rollback

Syntax show system rollback *number*
<compare *number*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

Options *number*—Number of a configuration to view. The output displays the configuration. The range of values is **0** through **49**.

compare *number* —(Optional) Number of another previously committed (rollback) configuration to compare to rollback ***number***. The output displays the differences between the two configurations. The range of values is **0** through **49**.

Required Privilege Level view

  [edit system login]
    'login ;'
      statement must contain additional statements
configuration syntax failed
```

PART 8

User and Access Management on J-EX Series Switches

CHAPTER 28

User and Access Management on J-EX Series Switches Overview

J-EX Series Switch Software Features Overview

The following tables list the J-EX Series Switches software features and the Junos OS Release in which they were introduced:

Related Documentation

- J-EX8208 Switch Hardware Overview on page 27
- J-EX8216 Switch Hardware Overview on page 30

Understanding Software Infrastructure and Processes

Each switch runs the Junos OS for J-EX Series Switches on its general-purpose processors. The Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS , you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- Routing Engine and Packet Forwarding Engine on page 392
- Junos OS Processes on page 392

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
  - Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 55 on page 393 describes the primary Junos OS processes.

Table 55: Junos OS Processes

Process	Name	Description
Chassis process	chassisd	Detects hardware on the system that is used to configure network interfaces. Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered. Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.
Ethernet switching process	eswd	Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces. Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.
Forwarding process	pfem	Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Management process	mgd	Provides communication between the other processes and an interface to the configuration database. Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured. Interacts with the other processes when commands are issued through one of the user interfaces on the switch. If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.
Routing protocol process	rpd	Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.

Related Documentation

- For more information about processes, see the *Junos OS Network Operations Guide* at http://www.juniper.net/techpubs/software/junos/.
- For more information about basic system parameters, supported protocols, and software processes, see *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

CHAPTER 29

User Access Management Configuration

Configuring Management Access for the J-EX Series Switch (J-Web Procedure)

You can manage a J-EX Series switch remotely through the J-Web interface. To communicate with the switch, the J-Web interface uses Hypertext Transfer Protocol (HTTP). HTTP allows easy Web access but no encryption. The data that is transmitted between the Web browser and the switch by means of HTTP is vulnerable to interception and attack. To enable secure Web access the switch supports HTTP over Secure Sockets Layer (HTTPS). You can enable HTTP or HTTPS access on specific interfaces and ports as needed.

Navigate to the Secure Access Configuration page by selecting **Configure** > **System Properties** > **Management Access**. On this page, you can enable HTTP and HTTPS access on interfaces for managing the J-EX Series switch through the J-Web interface. You can also install SSL certificates and enable Junos XML management protocol over SSL with the Secure Access page.

1. Click **Edit** to modify the configuration. Enter information into the Management Access Configuration page as described in Table 56 on page 396.
2. To verify that Web access is enabled correctly, connect to the switch using the appropriate method:
   - For HTTP access—In your Web browser, type **http://*URL*** or **http://*IP address***.
   - For HTTPS access—In your Web browser, type **https://*URL*** or **https://*IP address***.
   - For SSL Junos XML management protocol access—To use this option, you must have a Junos XML management protocol client such as Junos Scope. For information about how to log into Junos Scope, see the *Junos Scope Software User Guide*.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

Table 56: Secure Management Access Configuration Summary

Field	Function	Your Action
Management Access tab		
Management Port IP/Management Port IPv6	Specifies the management port IP address. The software supports both IPv4 (displayed as IP) and IPv6 address. NOTE: IPv6 is not supported on EX 4500 switches.	To specify an IPv4 address: 1. Select the check box **IPv4 address**. 2. Type an IP address—for example: **10.10.10.10**. 3. Enter the subnet mask or address prefix. For example, 24 bits represents **255.255.255.0**. 4. Click **OK**. To specify an IPv6 address: 1. Select the check box **IPv6 address**. 2. Type an IP address—for example:**2001:ab8:85a3::8a2e:370:7334**. 3. Enter the subnet mask or address prefix. 4. Click **OK**.
Default Gateway	Defines a default gateway through which to direct packets addressed to networks that are not explicitly listed in the bridge table constructed by the switch.	For IPv4 address type a 32-bit IP address, in dotted decimal notation. Type a 128-bit IP address for IPv6 address type.
Loopback address	Specifies the IP address of the loopback interface.	Type an IP address.
Subnet Mask	Specifies the subnet mask for the loopback interface.	Enter the subnet mask or address prefix.
Services tab		
Services	Specifies services to be enabled: telnet and SSH.	Select to enable the required services.
Enable Junos XML management protocol over Clear Text	Enables clear text access to the Junos XML management protocol XML scripting API.	To enable clear text access, select the **Enable Junos XML management protocol over Clear Text** check box.
Enable Junos XML protocol over SSL	Enables secure SSL access to the Junos XML management protocol XML scripting API.	To enable SSL access, select the **Enable Junos XML management protocol over SSL** check box.

Table 56: Secure Management Access Configuration Summary *(continued)*

Field	Function	Your Action
Junos XML management protocol Certificate	Specifies SSL certificates to be used for encryption. This field is available only after you create at least one SSL certificate.	To enable an SSL certificate, select a certificate from the Junos XML management protocol SSL Certificate list—for example, **new**.
Enable HTTP	Enables HTTP access on interfaces.	To enable HTTP access, select the **Enable HTTP access** check box. Select and clear interfaces by clicking the direction arrows: • To enable HTTP access on an interface, add the interface to the HTTP Interfaces list. You can either select all interfaces or specific interfaces.
Enable HTTPS	Enables HTTPS access on interfaces.	To enable HTTPS access, select the **Enable HTTPS access** check box. Select and deselect interfaces by clicking the direction arrows: • To enable HTTPS access on an interface, add the interface to the HTTPS Interfaces list. You can either select all interfaces or specific interfaces. NOTE: Specify the certificate to be used for HTTPS access.
Certificates tab		
Certificates	Displays digital certificates required for SSL access to the switch. Allows you to add and delete SSL certificates.	To add a certificate: 1. Have a general SSL certificate available. See Generating SSL Certificates for more information. 2. Click **Add**. The Add a Local Certificate page opens. 3. Type a name in the Certificate Name box—for example, **new**. 4. Open the certificate file and copy its contents. 5. Paste the generated certificate and RSA private key in the Certificate box. To edit a certificate, select it and click **Edit**. To delete a certificate, select it and click **Delete**.

Related Documentation

- Understanding J-Web User Interface Sessions on page 133

Generating SSL Certificates to Be Used for Secure Web Access

You can set up secure Web access for a J-EX Series switch. To enable secure Web access, you must generate a digital Secure Sockets Layer (SSL) certificate and then enable HTTPS access on the switch.

To generate an SSL certificate:

1. Enter the following **openssl** command in your SSH command-line interface on a BSD or Linux system on which **openssl** is installed. The **openssl** command generates a self-signed SSL certificate in the privacy-enhanced mail (PEM) format. It writes the certificate and an unencrypted 1024-bit RSA private key to the specified file.

   % openssl req –x509 –nodes –newkey rsa:1024 –keyout *filename*.pem -out *filename*.pem

   where ***filename*** is the name of a file in which you want the SSL certificate to be written—for example, **my-certificate**.

2. When prompted, type the appropriate information in the identification form. For example, type **US** for the country name.

3. Display the contents of the file that you created.

   cat my-certificate.pem

You can use the J-Web Configuration page to install the SSL certificate on the switch. To do this, copy the file containing the certificate from the BSD or Linux system to the switch. Then open the file, copy its contents, and paste them into the Certificate box on the J-Web Secure Access Configuration page.

You can also use the following CLI statement to install the SSL certificate on the switch:

```
[edit]
user@switch# set security certificates local my-signed-cert load-key-file my-certificate.pem
```

Related Documentation

- Security Features for J-EX Series Switches Overview on page 16

Configuring MS-CHAPv2 to Provide Password-Change Support (CLI Procedure)

Junos OS for J-EX Series switches enables you to configure the Microsoft Corporation implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the switch to provide password-change support. Configuring MS-CHAPv2 on the switch provides users accessing a switch the option of changing the password when the password expires, is reset, or is configured to be changed at next login.

See RFC 2433 at , Microsoft PPP CHAP Extensions, for information about MS-CHAP.

Before you configure MS-CHAPv2 to provide password-change support, ensure that you have:

- Configured RADIUS server authentication. Configure users on the authentication server and set the first-tried option in the authentication order to radius. See “Example: Connecting a RADIUS Server for 802.1X to a J-EX Series Switch” on page 2267.

To configure MS-CHAPv2, specify the following:

```
[edit system radius-options]
user@switch# set password-protocol mschap-v2
```

You must have the required access permission on the switch in order to change your password.

Related Documentation

- Managing Users (J-Web Procedure) on page 401
- For more about configuring user access, see the *Junos OS Access Privilege Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

CHAPTER 30

Monitoring Users

Managing Users (J-Web Procedure)

You can use the Users Configuration page for user information to add new users to a J-EX Series switch. For each account, you define a login name and password for the user and specify a login class for access privileges.

To configure users:

1. Select **Configure** > **System Properties** > **User Management**.

   The User Management page displays details of users, the authentication order, the RADIUS servers and TACACS servers present.

2. Click **Edit**.
3. Click any of the following options on the **Users** tab:
   - **Add**—Select this option to add a user. Enter details as described in Table 57 on page 402.
   - **Edit**—Select this option to edit an existing user's details. Enter details as described in Table 57 on page 402.
   - **Delete**—Select this option to delete a user.
4. Click an option on the **Authentication Methods and Order** tab:
   - Authentication Order—Drag and drop the authentication type from the Available Methods section to the Selected Methods. Click the up or down buttons to modify the authentication order.
   - RADIUS server—Click one:
     - **Add**—Select this option to add an authentication server. Enter details as described in Table 58 on page 403.
     - **Edit**—Select this option to modify the authentication server details. Enter details as described in Table 58 on page 403.
     - **Delete**—Select this option to delete an authentication server from the list.

- TACACS server—Click one:
  - **Add**—Select this option to add an authentication server. Enter details as described in Table 58 on page 403.
  - **Edit**—Select this option to modify the authentication server details. Enter details as described in Table 58 on page 403.
  - **Delete**—Select this option to delete an authentication server from the list.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > Commit. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

Table 57: User Management Configuration Page Summary

Field	Function	Your Action
User Information		
Username (required)	Specifies the name that identifies the user.	Type the username. It must be unique within the switching platform. Do not include spaces, colons, or commas in the username.
User Id	Specifies the user identification.	Type the user's ID.
Full Name	Specifies the user's full name.	Type the user's full name. If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
Login Class (required)	Defines the user's access privilege.	Select the user's login class from the list: • **operator** • **read-only** • **super-user/superuser** • **unauthorized** This list also includes any user-defined login classes.
Password	Specifies the login password for this user.	Type the login password for this user. The login password must meet these criteria: • The password must be at least 6 characters long. • It can include alphabetic, numeric, and special characters, but not control characters. • It must contain at least one change of case or character class.
Confirm Password	Verifies the login password for this user.	Retype the login password for this user.

Table 58: Add an Authentication Server

Field	Function	Your Action
IP Address	Specifies the IP address of the server.	Type the server's 32-bit IP address, in dotted decimal notation.
Password	Specifies the password of the server.	Type the password of the server.
Confirm Password	Verifies that the password of the server is entered correctly.	Retype the password of the server.
Server Port	Specifies the port with which the server is associated.	Type the port number.
Source Address	Specifies the source address of the server.	Type the server's 32-bit IP address, in dotted decimal notation.
Retry Attempts	Specifies the number of login retries allowed after a login failure.	Type the number. NOTE: Only 1 retry is permitted for a TACACS server.
Time out	Specifies the time interval to wait before the connection to the server is closed.	Type the interval in seconds.

CHAPTER 31

Troubleshooting User Access Management

Troubleshooting Loss of the Root Password

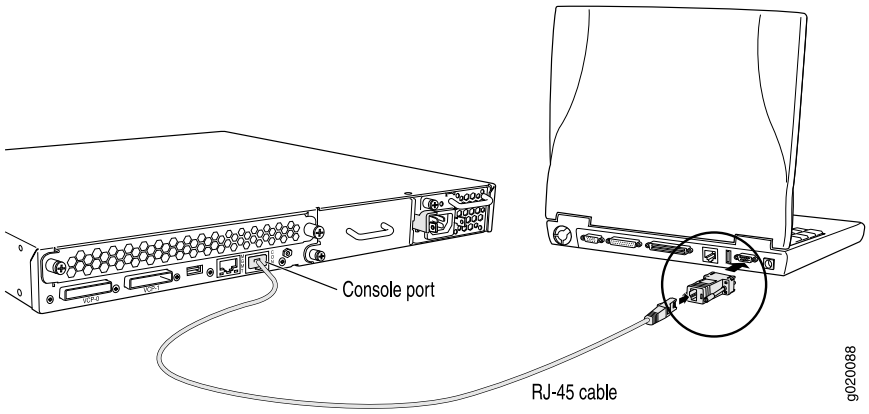
Problem If you forget the root password for the switch, you can use the password recovery procedure to reset the root password.

NOTE: You need physical access to the switch to recover the root password.

Solution To recover the root password:

1. Power off your switch by unplugging the power cord or turning off the power at the wall switch.
2. Insert one end of the Ethernet cable into the serial port on the management device and connect the other end to the console port on the back of the switch. See Figure 6 on page 405

Figure 6: Connecting to the Console Port on the J-EX Series Switch



3. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).

4. Configure the port settings as follows:
   - Bits per second: 9600
   - Data bits: 8
   - Parity: None
   - Stop bits: 1
   - Flow control: None
5. Power on your switch by plugging in the power cord or turning on the power at the wall switch.
6. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

   ```
   Hit [Enter] to boot immediately, or space bar for command prompt.
   Booting [kernel] in 1 second...
   ```

7. At the following prompt, type **boot -s** to start up the system in single-user mode:
   loader> boot -s
8. At the following prompt, type **recovery** to start the root password recovery procedure:
   Enter full path name of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery

   A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.
9. Enter configuration mode in the CLI:
   user@switch> configure
10. Set the root password. For example:
    user@switch# set system root-authentication plain-text-password
11. At the following prompt, enter the new root password. For example:
    New password: juniper1

    ```
    Retype new password:
    ```

12. At the second prompt, reenter the new root password.
13. If you are finished configuring the network, commit the configuration.
    root@switch# commit

    ```
    commit complete
    ```

14. Exit configuration mode in the CLI.
    root@switch# exit
15. Exit operational mode in the CLI.
    root@switch> exit
16. At the prompt, enter **y** to reboot the switch.
    Reboot the system? [y/n] y

CHAPTER 32

Configuration Statements for User and Access Management

allow-commands

Syntax allow-commands "*regular-expression*";

Hierarchy Level [edit system login **class** *class-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the operational mode commands that members of a login class can use.

Default If you omit this statement and the **deny-commands** statement, users can issue only those commands for which they have access privileges through the **permissions** statement.

Options ***regular-expression***—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Specifying Access Privileges for Junos OS Operational Mode Commands
- **deny-commands on page 415**
- **user on page 432**

allow-configuration

Syntax allow-configuration "*regular-expression*";

Hierarchy Level [edit system login **class** *class-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the configuration mode commands that members of a login class can use.

Default If you omit this statement and the **deny-configuration** statement, users can issue only those commands for which they have access privileges through the **permissions** statement.

Options ***regular-expression***—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Specifying Access Privileges for Junos OS Configuration Mode Commands
- Regular Expressions for Allowing and Denying Junos OS Configuration Mode Commands
- **deny-commands on page 415**
- **user on page 432**

announcement

Syntax announcement *text*;

Hierarchy Level [edit system **login**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a system login announcement. This announcement appears after a user logs in.

Options ***text***—Text of the announcement. If the text contains any spaces, enclose it in quotation marks.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration

Related Documentation

- Configuring the Junos OS to Display a System Login Announcement
- **message on page 421**

authentication (Login)

Syntax

```
authentication {
  (encrypted-password "password" | plain-text-password);
  ssh-dsa "public-key";
  ssh-rsa "public-key";
}
```

Hierarchy Level [edit system login user *username*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Authentication methods that a user can use to log in to the router or switch. You can assign multiple authentication methods to a single user.

Options

encrypted-password "*password*"—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

plain-text-password—Plain-text password. The command-line interface (CLI) prompts you for the password and then encrypts it.

ssh-dsa "*public-key*"—SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.

ssh-rsa "*public-key*"—SSH version 1 and SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Junos OS User Accounts
- **root-authentication on page 426**

authentication-order

Syntax authentication-order [*authentication-methods*];

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.

Default If you do not include the **authentication-order** statement, users are verified based on their configured passwords.

Options ***authentication-methods***—One or more authentication methods, listed in the order in which they should be tried. The method can be one or more of the following:

- **password**—Use the password configured for the user with the **authentication** statement at the **[edit system login user]** hierarchy level.
- **radius**—Use RADIUS authentication services.
- **tacplus**—Use TACACS+ authentication services.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication
- **authentication on page 411**

change-type

Syntax change-type (character-sets | set-transitions);

Hierarchy Level [edit system login **password**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set requirements for using character sets in plain-text passwords. When you combine this statement with the **minimum-changes** statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.

Options Specify one of the following:

- **character-sets**—The number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.
- **set-transitions**—The number of transitions between character sets.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Special Requirements for Junos OS Plain-Text Passwords
- **minimum-changes on page 422**

class (Assigning a Class to an Individual User)

Syntax class *class-name*;

Hierarchy Level [edit system login **user** *username*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a user's login class. You must configure one class for each user.

Options ***class-name***—One of the classes defined at the **[edit system login class]** hierarchy level.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Junos OS User Accounts

class (Defining Login Classes)

Syntax

```
class class-name {
  allow-commands "regular-expression";
  allow-configuration "regular-expression";
  deny-commands "regular-expression";
  deny-configuration "regular-expression";
  idle-timeout minutes;
  permissions [ permissions ];
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a login class.

Options *class-name*—A name you choose for the login class.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Defining Junos OS Login Classes
- user on page 432

deny-commands

Syntax deny-commands "*regular-expression*";

Hierarchy Level [edit system login **class**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the operational mode commands that the user is denied permission to issue even though the permissions set with the **permissions** statement would allow it.

Default If you omit this statement and the **allow-commands** statement, users can issue only those commands for which they have access privileges through the **permissions** statement.

Options ***regular-expression***—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Specifying Access Privileges for Junos OS Operational Mode Commands
- **allow-commands on page 409**
- **user on page 432**

deny-configuration

Syntax deny-configuration "*regular-expression*";

Hierarchy Level [edit system login **class**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the configuration mode commands that the user is denied permission to issue even though the permissions set with the **permissions** statement would allow it.

Default If you omit this statement and the **allow-configuration** statement, users can issue only those commands for which they have access privileges through the **permissions** statement.

Options ***regular-expression***—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- **user on page 432**

format

Syntax format (des | md5 | sha1);

Hierarchy Level [edit system login password]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the authentication algorithm for plain-text passwords.

Default For the Junos OS, the default encryption format is **md5**. For Junos-FIPS software, the default encryption format is **sha1**.

Options The hash algorithm that authenticates the password can be one of three algorithms:

- **des**—Has a block size of 8 bytes; its key size is 48 bits long.
- **md5**—Produces a 128-bit digest.
- **sha1**—Produces a 160-bit digest.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Special Requirements for Junos OS Plain-Text Passwords

full-name

Syntax full-name *complete-name*;

Hierarchy Level [edit system login **user**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the complete name of a user.

Options ***complete-name***—Full name of the user. If the name contains spaces, enclose it in quotation marks.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Junos OS User Accounts

idle-timeout

Syntax idle-timeout *minutes*;

Hierarchy Level [edit system login **class** *class-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For a login class, configure the maximum time that a session can be idle before the user is logged off the router or switch. The session times out after remaining at the CLI operational mode prompt for the specified time.

Default If you omit this statement, a user is never forced off the system after extended idle times.

Options ***minutes***—Maximum idle time.

Range: 0 through 100,000 minutes

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Timeout Value for Idle Login Sessions
- **user on page 432**

login

Syntax

```
login {
  announcement text;
  class class-name {
    allow-commands "regular-expression";
    allow-configuration "regular-expression";
    deny-commands "regular-expression";
    deny-configuration "regular-expression";
    idle-timeout minutes;
    login-tip;
    permissions [ permissions ];
  }
  message text;
  password {
    change-type (set-transitions | character-set);
    format (md5 | sha1 | des);
    maximum-length length;
    minimum-changes number;
    minimum-length length;
  }
  retry-options {
    backoff-threshold number;
    backoff-factor seconds;
    minimum-time seconds;
    tries-before-disconnect number;
  }
  user username {
    full-name complete-name;
    uid uid-value;
    class class-name;
    authentication authentication;
    (encrypted-password "password" | plain-text-password);
    ssh-rsa "public-key";
    ssh-dsa "public-key";
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure user access to the router or switch.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Defining Junos OS Login Classes

login-alarms

Syntax login-alarms;

Hierarchy Level [edit system login class admin]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Show system alarms automatically when an **admin** user logs on to the router.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

login-tip

Syntax login-tip;

Hierarchy Level [edit system login class *class-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable CLI tips at login.

Default Disabled.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring CLI Tips

maximum-length

Syntax maximum-length *length*;

Hierarchy Level [edit system login passwords]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum number of characters allowed in plain-text passwords. Newly created passwords must meet this requirement.

Default For Junos-FIPS software, the maximum number of characters for plain-text passwords is **20**. For Junos OS, no maximum is set.

Options **length**—The maximum number of characters the password can include.
Range: 1 to 64 characters

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Special Requirements for Junos OS Plain-Text Passwords

message

Syntax message *text*;

Hierarchy Level [edit system login]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a system login message. This message appears before a user logs in.

Options ***text***—Text of the message.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration

Related Documentation
- Configuring the Junos OS to Display a System Login Message
- **announcement on page 410**

minimum-changes

Syntax minimum-changes *number*;

Hierarchy Level [edit system login passwords]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.

This statement is used in combination with the **change-type** statement. If the change-type is **character-sets**, then the number of character sets included in the password is checked against the specified minimum. If change-type is **set-transitions**, then the number of character set changes in the password is checked against the specified minimum.

Default For Junos OS, the minimum number of changes is 1. For Junos-FIPS Software, the minimum number of changes is 3.

Options *number*—The minimum number of character sets (or character set changes) required for the password.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Special Requirements for Junos OS Plain-Text Passwords
- **change-type on page 413**

minimum-length

Syntax minimum-length *length*;

Hierarchy Level [edit system login passwords]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the minimum number of characters required in plain-text passwords. Newly created passwords must meet this requirement.

Default For Junos OS, the minimum number of characters for plain-text passwords is six. For Junos-FIPS software, the minimum number of characters for plain-text passwords is 10.

Options **length**—The minimum number of characters the password must include.

Range: 6 to 20 characters

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Special Requirements for Junos OS Plain-Text Passwords
- **maximum-length on page 421**

password (Login)

Syntax
```
password {
  change-type (set-transitions | character-set);
  format (md5 | sha1 | des);
  maximum-length length;
  minimum-changes number;
  minimum-length length;
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure special requirements such as character length and encryption format for plain-text passwords. Newly created passwords must meet these requirements.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Special Requirements for Junos OS Plain-Text Passwords
- **maximum-length on page 421**

permissions

Syntax permissions [*permissions*];

Hierarchy Level [edit system login **class**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the login access privileges to be provided on the router or switch.

Options ***permissions***—Privilege type. For a list of permission flag types, see Junos OS Access Privilege Levels Overview.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Access Privilege Levels
- **user on page 432**

radius-options

Syntax
```
radius-options {
  attributes {
    nas-ip-address ip-address;
  }
  password-protocol mschap-v2;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure RADIUS options for the NAS-IP address for outgoing RADIUS packets and password protocol used in RADIUS packets.

Options ***ip-address***—IP address of the network access server (NAS) that requests user authentication.

mschap-v2—Protocol MS-CHAPv2, used for password authentication and password changing.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring RADIUS Authentication

retry-options

Syntax

```
retry-options {
  backoff-threshold number;
  backoff-factor seconds;
  maximum-time seconds;
  minimum-time seconds;
  tries-before-disconnect number;
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Maximum number of times a user can attempt to enter a password while logging in through SSH or Telnet before being disconnected.

Options

backoff-threshold *number*—Threshold for the number of failed login attempts before the user experiences a delay when attempting to reenter a password. Use the **backoff-factor** option to specify the length of delay, in seconds.

Range: 1 through 3

Default: 2

backoff-factor *seconds*—Length of delay after each failed login attempt. The length of delay increases by this value for each subsequent login attempt after the value specified in the **backoff-threshold** option.

Range: 5 through 10

Default: 5

maximum-time *seconds*—Maximum length of time that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the configured **maximum-time**, the connection is closed.

Range: 20 through 300

Default: 120

minimum-time *seconds*—Minimum length of time that the connection remains open while the user is attempting to enter a password to log in.

Range: 20 through 60

Default: 20

tries-before-disconnect *number*—Maximum number of times a user is allowed to attempt to enter a password to log in through SSH or Telnet.

Range: 1 through 10

Default: 10

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Limiting the Number of User Login Attempts for SSH and Telnet Sessions
- **rate-limit on page 487**

root-authentication

Syntax

```
root-authentication {
  (encrypted-password "password" | plain-text-password);
  ssh-dsa "public-key";
  ssh-rsa "public-key";
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the authentication methods for the root-level user, whose username is **root**.

Options

encrypted-password "*password*"— MD5 or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

plain-text-password—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.

ssh-dsa "*public-key*"—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.

ssh-rsa "*public-key*"—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Root Password
- **authentication on page 411**

root-login

Syntax root-login (allow | deny | deny-password);

Hierarchy Level [edit system services ssh]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Control user access through SSH.

Default Allow user access through SSH.

Options

allow—Allow users to log in to the router or switch as root through SSH.

deny—Disable users from logging in to the router or switch as root through SSH.

deny-password—Allow users to log in to the router or switch as root through SSH when the authentication method (for example, RSA authentication) does not require a password.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring SSH Service for Remote Access to the Router or Switch
- Configuring SSH Service for Remote Access to the Router or Switch

tacplus-options

Syntax

```
tacplus-options {
  service-name service-name;
  (no-cmd-attribute-value | exclude-cmd-attribute);
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure TACACS+ options for authentication and accounting.

Options

service-name *service-name*—The name of the authentication service used when configuring multiple TACACS+ servers to use the same authentication service.

Default: junos-exec

no-cmd-attribute-value—Set the cmd attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.

exclude-cmd-attribute—Exclude the cmd attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring TACACS+ Authentication
- Configuring TACACS+ System Accounting
- Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

tacplus-server

Syntax

```
tacplus-server server-address {
    secret password;
    single-connection;
    source-address source-address;
    timeout seconds;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the TACACS+ server.

Options ***server-address***—Address of the TACACS+ authentication server.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

traceoptions (Address-Assignment Pool)

Syntax

```
traceoptions {
  file filename {
    files number;
    size maximum-file-size;
    match regex;
    <world-readable | no-world-readable>;
  }
  flag address-assignment;
  flag all;
  flag configuration;
  flag framework;
  flag ldap;
  flag local-authentication;
  flag radius;
}
```

Hierarchy Level [edit system processes general-authentication-service]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure tracing options.

Options

file *filename*—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **address-assignment**—All address-assignment events
- **all**—All tracing operations
- **configuration**—Configuration events
- **framework**—Authentication framework events
- **ldap**—LDAP authentication events
- **local-authentication**—Local authentication events
- **radius**—RADIUS authentication events

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restrict access to the originator of the trace operation only.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: **10** KB through **1** GB

Default: **128** KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

- Configuring Address-Assignment Pools

uid

Syntax
uid *uid-value*;

Hierarchy Level
[edit system login **user**]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Configure a user identifier for a login account.

Options
uid-value—Number associated with the login account. This value must be unique on the router or switch.

Range: **100** through **64000**

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Junos OS User Accounts

user (Access)

Syntax

```
user username {
  authentication {
  class class-name;
  (encrypted-password "password" | plain-text-password);
  full-name complete-name;
  ssh-dsa "public-key";
  ssh-rsa "public-key";
  uid uid-value;
  }
}
```

Hierarchy Level [edit system login]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure access permission for individual users.

Options The remaining statements are explained separately.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

CHAPTER 33

Operational Mode Commands for User and Access Management

request message

Syntax
request message all message "*text*"
request message message "*text*" (terminal *terminal-name* | user *user-name*)

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display a message on the screens of all users who are logged in to the router or switch or on specific screens.

Options
all—Display a message on the terminal of all users who are currently logged in.

message "*text*"—Message to display.

terminal *terminal-name*—Name of the terminal on which to display the message.

user *user-name*—Name of the user to whom to direct the message.

Required Privilege Level
maintenance

List of Sample Output
request message message on page 434

Output Fields
When you enter this command, you are provided feedback on the status of your request.

request message message

```
user@host> request message message "Maintenance window in 10 minutes" user maria
Message from user@host on ttyp0 at 20:27 ...
Maintenance window in 10 minutes
EOF
```

show subscribers

Syntax

show subscribers
<address *address*>
<client-type *client-type*>
<interface *interface*>
<logical-system *logical-system*>
<mac-address *mac-address*>
<profile-name *profile-name*>
<routing-instance *routing-instance*>
<stacked-vlan-id *stacked-vlan-id*>
<subscriber-state *subscriber-state*>
<vlan-id *vlan-id*>
<count | detail | extensive |summary (all | logical-system *logical-system* | routing-instance *routing-instance*) | terse>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.
client-type, **mac-address**, **subscriber-state**, **extensive**, and **summary** options introduced in Junos OS Release 10.2.
count option usage with other options introduced in Junos OS Release 10.2

Description

Display information for active subscribers.

Options

address—(Optional) Display subscribers whose IP address matches the specified address.

client-type—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, or VLAN).

count—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the count option alone or with the **address**, **client-type**, **interface**, **logical-system**, **mac-address**, **profile-name**, **routing-instance**, **stacked-vlan-id**, **subscriber-state**, and **vlan-id** options.

interface—(Optional) Display subscribers whose interface matches the specified interface.

logical system—(Optional) Display subscribers whose logical system matches the specified logical system.

mac-address—(Optional) Display subscribers whose MAC address matches the specified MAC address.

profile name—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

routing instance—(Optional) Display subscribers whose routing instance matches the specified routing instance.

subscriber-state—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

vlan-id—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

stacked-vlan-id—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

detail | terse | extensive—(Optional) Display the specified level of output.

summary—(Optional) Display summary output.

NOTE: Due to display limitations, logical system and routing instance output values are truncated when necessary.

Required Privilege Level view

Output Fields Table 59 on page 436 lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

Table 59: show subscribers Output Fields

Field Name	Field Description
User Name	Name of subscriber.
Type	Subscriber client type (DHCP, VLAN, PPP, PPPOE, or L2TP).
IP Address	Subscriber IPv4 address.
IP Netmask	Subscriber IP netmask.
IPv6 Address	Subscriber IPv6 address.
IPv6 Prefix	Subscriber IPv6 prefix.

Table 59: show subscribers Output Fields *(continued)*

Field Name	Field Description
IPv6 Prefix Length	Length of the subscriber IPv6 prefix.
Logical System	Logical system associated with the subscriber.
Routing Instance	Routing instance associated with the subscriber.
Interface	Interface associated with the subscriber. The router displays subscribers whose interface matches or begins with the specified interface.
Interface Type	Whether the subscriber interface is static or dynamic.
Dynamic Profile Name	Dynamic profile used for the subscriber.
MAC Address	MAC address associated with the subscriber.
State	Current state of the subscriber session (Init, Configured, Active, Terminating, Terminated).
VLAN Id	VLAN ID associated with the subscriber in the form *tpid.vlan-id*.
Stacked VLAN Id	Stacked VLAN ID associated with the subscriber in the form *tpid.vlan-id*.
RADIUS Accounting ID	RADIUS accounting ID associated with the subscriber.
Agent Circuit ID	Option 82 agent circuit ID associated with the subscriber.
Agent Remote ID	Option 82 agent remote ID associated with the subscriber.
DHCP Relay IP Address	IP address used by the DHCP relay agent.
Login Time	Date and time at which the subscriber logged in.
Session ID	ID number for a subscriber service session.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session Name	Service session profile name.
IPv4 Input Filter Name	Name assigned to the IPv4 input filter (client or service session).
IPv4 Output Filter Name	Name assigned to the IPv4 output filter (client or service session).
IPv6 Input Filter Name	Name assigned to the IPv6 input filter (client or service session).
IPv6 Output Filter Name	Name assigned to the IPv6 output filter (client or service session).
IFL Input Filter Name	Name assigned to the logical interface input filter (client or service session).

Table 59: show subscribers Output Fields *(continued)*

Field Name	Field Description
IFL Output Filter Name	Name assigned to the logical interface output filter (client or service session).
Subscribers by State	Number of subscribers summarized by state. The summary information includes the following: • Init—Number of subscriber currently in the initialization state. • Configured—Number of configured subscribers. • Active—Number of active subscribers. • Terminating—Number of subscribers currently terminating. • Terminated—Number of terminated subscribers. Summary information includes subscriber counts per state and the total number of subscribers.
Subscribers by Client Type	Number of subscribers summarized by client type. Client types can include DHCP, VLAN, PPP, PPPOE, and L2TP. Summary information includes subscriber counts per client type and the total number of subscribers.
Subscribers by LS:RI	Number of subscribers summarized by logical system:routing instance (LS:RI) combination. Summary information includes subscriber counts per LS:RI and the total number of subscribers.

PART 9

Junos OS for J-EX Series Switches System Services

CHAPTER 34

System Services Overview

DHCP Overview

DHCP Services for J-EX Series Switches Overview

A Dynamic Host Configuration Protocol (DHCP) server can automatically allocate IP addresses and also deliver configuration settings to client hosts on a subnet.

DHCP is particularly useful for managing a pool of IP addresses among hosts. An IP address can be leased to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses among a group of hosts that do not need permanent IP addresses.

DHCP, through the use of the automatic software download feature, can also be used to install software packages on J-EX Series Switches. Users can define a path to a software package on the DHCP server, and then the DHCP server communicates this path to J-EX Series switches acting as DHCP clients as part of the DHCP message exchange process. The DHCP clients that have been configured for automatic software download receive these messages and, when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, download and install the software package. See “Upgrading Software Using Automatic Software Download on J-EX Series Switches” on page 82.

To configure DHCP access service for a J-EX Series switch, you can use either the Junos OS command-line interface (CLI) or the J-Web user interface.

For detailed information about configuring DHCP services, see the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/. The configuration for DHCP service on the J-EX Series switch includes the **dhcp** statement at the **[edit system services]** hierarchy level.

You can monitor DHCP services for the switch by using either operational-mode CLI commands or the J-Web interface.

Related Documentation

- For information about configuring DHCP services with the CLI, see the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
- Configuring DHCP Services (J-Web Procedure) on page 447
- Upgrading Software Using Automatic Software Download on J-EX Series Switches on page 82
- Monitoring DHCP Services on page 451

DHCP/BOOTP Relay for J-EX Series Switches Overview

You can configure the J-EX Series Switch to act as a Dynamic Host Configuration Protocol (DHCP) or Bootstrap Protocol (BOOTP) relay agent. This means that a locally attached host can issue a DHCP or BOOTP request as a broadcast message. If the switch sees this broadcast message, it relays the message to a specified DHCP or BOOTP server. You should configure the switch to be a DHCP/BOOTP relay agent if you have locally attached hosts and a distant DHCP or BOOTP server.

For detailed information about configuring a DHCP/BOOTP relay agent, see the *Junos OS Policy Framework Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

You can configure a J-EX Series Switch to use the gateway IP address (giaddr) as the source IP address of the switch for relayed DHCP packets when the switch is used as the DHCP relay agent. For information on configuring this option, see the **source-address-giaddr** configuration statement.

NOTE: Because DHCP/BOOTP messages are broadcast and are not directed to a specific server, switch, or router, J-EX Series switches cannot function as both a DHCP server and a DHCP/BOOTP relay agent at the same time. The Junos OS generates a commit error if both options are configured at the same time, and the commit will not succeed until one of the options is removed.

Related Documentation

- For information about configuring the switch as a DHCP/BOOTP relay agent, see the *Junos OS Policy Framework Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.
- DHCP Services for J-EX Series Switches Overview on page 445

CHAPTER 35

System Services Configuration

Configuring DHCP Services (J-Web Procedure)

Use the J-Web DHCP Configuration pages to configure DHCP pools for subnets and static bindings for DHCP clients on a J-EX Series switch. If DHCP pools or static bindings are already configured, use the Configure Global DHCP Parameters Configuration page to add settings for these pools and static bindings. Settings that have been previously configured for DHCP pools or static bindings are not overridden when you use the Configure Global DHCP Parameters Configuration page.

To configure the DHCP server:

1. Select **Configure** > **Services** > **DHCP**.
2. Access a DHCP Configuration page:
   - To configure a DHCP pool for a subnet, click **Add** in the DHCP Pools box.
   - To configure a static binding for a DHCP client, click **Add** in the DHCP Static Binding box.
   - To globally configure settings for existing DHCP pools and static bindings, click **Configure Global DHCP Parameters**.
3. Enter information into the DHCP Configuration pages as described in Table 60 on page 448.
4. To apply the configuration, click **Apply**.

NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

Table 60: DHCP Server Configuration Pages Summary

Field	Function	Your Action
DHCP Pool Information		
DHCP Subnet (required)	Specifies the subnet on which DHCP is configured.	Type an IP address prefix.
Address Range (Low) (required)	Specifies the lowest address in the IP address pool range.	Type an IP address that is part of the subnet specified in DHCP Subnet.
Address Range (High) (required)	Specifies the highest address in the IP address pool range.	Type an IP address that is part of the subnet specified in DHCP Subnet. This address must be greater than the address specified in Address Range (Low).
Exclude Addresses	Specifies addresses to exclude from the IP address pool.	• To add an excluded address, type the address next to the **Add** button, and click **Add**. • To delete an excluded address, select the address in the Exclude Addresses box, and click **Delete**.
Lease Time		
Maximum Lease Time (Seconds)	Specifies the maximum length of time a client can hold a lease. (Dynamic BOOTP lease lengths can exceed this maximum time.)	Type a number from 60 through 4,294,967,295 (seconds). You can also type **infinite** to specify a lease that never expires.
Default Lease Time (Seconds)	Specifies the length of time a client can hold a lease for clients that do not request a specific lease length.	Type a number from 60 through 2,147,483,647 (seconds). You can also type **infinite** to specify a lease that never expires.
Server Information		
Server Identifier	Specifies the IP address of the DHCP server reported to a client.	Type the IP address of the server. If you do not specify a server identifier, the primary address of the interface on which the DHCP exchange occurs is used.
Domain Name	Specifies the domain name that clients must use to resolve hostnames.	Type the name of the domain.
Domain Search	Specifies the order—from top to bottom—in which clients must append domain names when resolving hostnames using DNS.	• To add a domain name, type the name next to the **Add** button, and click **Add**. • To delete a domain name, select the name in the Domain Search box, and click **Delete**.
DNS Name Servers	Defines a list of DNS servers the client can use, in the specified order—from top to bottom.	• To add a DNS server, type an IP address next to the **Add** button, and click **Add**. • To remove a DNS server, select the IP address in the DNS Name Servers box, and click **Delete**.

Table 60: DHCP Server Configuration Pages Summary *(continued)*

Field	Function	Your Action
Gateway Routers	Defines a list of relay agents on the subnet, in the specified order—from top to bottom.	• To add a relay agent, type an IP address next to the **Add** button, and click **Add**. • To remove a relay agent, select the IP address in the Gateway Routers box, and click **Delete**.
WINS Servers	Defines a list of NetBIOS name servers, in the specified order—from top to bottom.	• To add a NetBIOS name server, type an IP address next to the **Add** button, and click **Add**. • To remove a NetBIOS name server, select the IP address in the WINS Servers box, and click **Delete**.
Boot Options		
Boot File	Specifies the path and filename of the initial boot file to be used by the client.	Type a path and filename.
Boot Server	Specifies the TFTP server that provides the initial boot file to the client.	Type the IP address or hostname of the TFTP server.
DHCP Static Binding Information		
DHCP MAC Address (required)	Specifies the MAC address of the client to be permanently assigned a static IP address.	Type the hexadecimal MAC address of the client.
Fixed IP Addresses (required)	Defines a list of IP addresses permanently assigned to the client. A static binding must have at least one fixed address assigned to it, but multiple addresses are also allowed.	• To add an IP address, type it next to the **Add** button, and click **Add**. • To remove an IP address, select it in the Fixed IP Addresses box, and click **Delete**.
Host Name	Specifies the name of the client used in DHCP messages exchanged between the server and the client. The name must be unique to the client within the subnet on which the client resides.	Type a client hostname.
Client Identifier	Specifies the name of the client used by the DHCP server to index its database of address bindings. The name must be unique to the client within the subnet on which the client resides.	Type a client identifier in string form.
Hexadecimal Client Identifier	Specifies the name of the client, in hexadecimal form, used by the DHCP server to index its database of address bindings. The name must be unique to the client within the subnet on which the client resides.	Type a client identifier in hexadecimal form.

Configuring a DHCP SIP Server (CLI Procedure)

You can use the **sip-server** statement on the J-EX Series switch to configure option 120 on a DHCP server. The DHCP server sends configured option values—Session Initiation Protocol (SIP) server addresses or names—to DHCP clients when they request them. Previously, you were only allowed to specify a SIP server by address using **[edit system services dhcp option 120]**. You specify either an IPv4 address or a fully qualified domain name to be used by SIP clients to locate a SIP server. You cannot specify both an address and name in the same statement.

To configure a SIP server using the ***address*** option:

```
[edit system services dhcp]
user@switch# set sip-server address
```

For example, to configure one address:

```
[edit system services dhcp]
user@switch set sip-server 172.168.0.11
```

To configure a SIP server using the ***name*** option:

```
[edit system services dhcp]
user@switch# set sip-server name
```

For example, to configure a name:

```
[edit system services dhcp]
user@switch set sip-server abc.example.com
```

CHAPTER 36

Monitoring System Services

Monitoring DHCP Services

Purpose A switch or router can operate as a DHCP server. Use the monitoring functionality to view information about dynamic and static DHCP leases, conflicts, pools, and statistics.

Action To monitor the DHCP server in the J-Web interface, select **Monitor > Services > DHCP**.

To monitor the DHCP server in the CLI, enter the following CLI commands:

- **show system services dhcp binding**
- **show system services dhcp conflict**
- **show system services dhcp pool**
- **show system services dhcp statistics**
- **show system services dhcp relay-statistics**
- **show system services dhcp global**
- **show system services dhcp client**

Meaning Table 61 on page 452 summarizes the output fields in DHCP displays in the J-Web interface.

Table 61: Summary of DHCP Output Fields

Field	Values	Additional Information
Global tab		
Name	This column displays the following information: • Boot lease length • Domain Name • Name servers • Server identifier • Domain search • Gateway routers • WINS server • Boot file • Boot server • Default lease time • Minimum lease time • Maximum lease time	
Value	Displays the value for each of the parameters in the Name column.	
Bindings tab		
Allocated Address	List of IP addresses the DHCP server has assigned to clients.	
MAC Address	Corresponding media access control (MAC) address of the client.	
Binding Type	Type of binding assigned to the client: **dynamic** or **static**.	DHCP servers can assign a dynamic binding from a pool of IP addresses or a static binding to one or more specific IP addresses.
Lease Expires	Date and time the lease expires, or **never** for leases that do not expire.	
Pools tab		
Pool Name	Subnet on which the IP address pool is defined.	
Low Address	Lowest address in the IP address pool.	
High Address	Highest address in the IP address pool.	
Excluded Addresses	Addresses excluded from the address pool.	
Clients tab		

Table 61: Summary of DHCP Output Fields *(continued)*

Field	Values	Additional Information
Interface Name	Name of the logical interface.	
Hardware Address	Vendor identification.	
Status	State of the client binding.	
Address Obtained	IP address obtained from the DHCP server.	
Update Server	Indicates whether server update is enabled.	
Lease Obtained	Date and time the lease was obtained.	
Lease Expires	Date and time the lease expires.	
Renew	Reacquires an IP address from the server for the interface. When you click this option, the command sends a discover message if the client state is INIT and a renew request message if the client state is BOUND. For all other states it performs no action.	
Release	Clears other resources received earlier from the server, and reinitializes the client state to INIT for the particular interface.	
Conflicts tab		
Detection Time	Date and time the client detected the conflict.	
Detection Method	How the conflict was detected.	Only client-detected conflicts are displayed.
Address	IP address where the conflict occurs.	The addresses in the conflicts list remain excluded until you use the **clear system services dhcp conflict** command to manually clear the list.
DHCP Statistics		
Relay Statistics tab		
Packet Counters	Displays the number of packet counters.	
Dropped Packet Counters	Graphically displays the number of dropped packet counters.	

Table 61: Summary of DHCP Output Fields *(continued)*

Field	Values	Additional Information
Statistics tab		
Packets dropped	Total number of packets dropped and the number of packets dropped due to a particular condition.	
Messages received	Number of BOOTREQUEST, DHCPDECLINE, DHCPDISCOVER, DHCPINFORM, DHCPRELEASE, and DHCPREQUEST messages sent from DHCP clients and received by the DHCP server.	
Messages sent	Number of BOOTREPLY, DHCPACK, DHCPOFFER, and DHCPNAK messages sent from the DHCP server to DHCP clients.

CHAPTER 37

Configuration Statements for System Services

boot-file

Syntax boot-file *filename*;

Hierarchy Level [edit system services **dhcp**],
[edit system services dhcp **pool**],
[edit system services dhcp **static-binding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete DHCP setup.

Options ***filename***—The location of the boot file on the boot server. The filename can include a pathname.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Router, Switch, or Interface to Act as a DHCP Server on J Series Services Routers and J-EX Series Switches
- **boot-server on page 456**

boot-server (DHCP)

Syntax boot-server *address*;

Hierarchy Level [edit system services **dhcp**],
[edit system services dhcp **pool**],
[edit system services dhcp **static-binding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Configure the name of the boot server advertised to DHCP clients. The client uses a boot file located on the boot server to complete DHCP setup.

Options ***address***—Address of a boot server. You must specify an IPv4 address, not a hostname.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **boot-file on page 455**

bootp

Syntax

```
bootp {
  client-response-ttl number;
  description text-description;
  interface interface-group {
    client-response-ttl number;
    description text-description;
    maximum-hop-count number;
    minimum-wait-time seconds;
    no-listen;
    server address {
      <logical-system logical-system-name> <routing-instance
        [ routing-instance-names ]>;
    }
  }
  maximum-hop-count number;
  minimum-wait-time seconds;
  server address {
    <logical-system logical-system-name> <routing-instance
      [ routing-instance-names ]>;
  }
}
```

Hierarchy Level [edit forwarding-options helpers]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configures a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent.

DHCP relaying is disabled.

Options The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents
- Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure) on page 2646

ca-name

Syntax ca-name *ca-identity*;

Hierarchy Level [edit security certificates **certification-authority**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Specify the certificate authority (CA) identity to use in the certificate request.

Options ***ca-identity***—CA identity to use in the certificate request.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring Digital Certificates for an ES PIC

cache-size

Syntax cache-size *bytes*;

Hierarchy Level [edit security **certificates**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Configure the cache size for digital certificates.

Options ***bytes***—Cache size for digital certificates.

Range: 64 through 4,294,967,295

Default: 2 megabytes (MB)

NOTE: We recommend that you limit your cache size to 4 MB.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration

Related Documentation
- Configuring Digital Certificates for an ES PIC

cache-timeout-negative

Syntax cache-timeout-negative *seconds*;

Hierarchy Level [edit security **certificates**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Configure a negative cache for digital certificates.

Options ***seconds***—Negative time to cache digital certificates, in seconds.
Range: 10 through 4,294,967,295
Default: 20

CAUTION: Configuring a large negative cache value can lead to a denial-of-service attack.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration

certificates

Syntax

```
certificates {
  cache-size bytes;
  cache-timeout-negative seconds;
  certification-authority ca-profile-name {
    ca-name ca-identity;
    crl file-name;
    encoding (binary | pem);
    enrollment-url url-name;
    file certificate-filename;
    ldap-url url-name;
  }
  enrollment-retry attempts;
  local certificate-name {
    certificate-key-string;
    load-key-file URL-or-path;
  }
  maximum-certificates number;
  path-length certificate-path-length;
}
```

Hierarchy Level [edit security]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface J-EX Series switches) Configure the digital certificates for IPsec.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

certification-authority

Syntax

```
certification-authority ca-profile-name {
    ca-name ca-identity;
    crl file-name;
    encoding (binary | pem);
    enrollment-url url-name;
    file certificate-filename;
    ldap-url url-name;
}
```

Hierarchy Level [edit security **certificates**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Configure a certificate authority profile name.

The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration

client-identifier

Syntax client-identifier (ascii *client-id* | hexadecimal *client-id*);

Hierarchy Level [edit system services dhcp **static-binding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Configure the client's unique identifier. This identifier is used by the DHCP server to index its database of address bindings. Either a client identifier or the client's MAC address is required to uniquely identify the client on the network.

Options ***client-id***—A name or number that uniquely identifies the client on the network. The client identifier can be an ASCII string or hexadecimal digits.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

connection-limit

Syntax connection-limit *limit*;

Hierarchy Level [edit system services finger],
[edit system services **ftp**],
[edit system services **ssh**],
[edit system services **telnet**],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the maximum number of established connections for each type of system service (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) for each IP protocol, such as IPv6 and IPv4.

Options *limit*—(Optional) Maximum number of established connections.

Range: 1 through 250

Default: 75

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring clear-text or SSL Service for Junos XML Management Protocol Client Applications
- Configuring DTCP-over-SSH Service for the Flow-Tap Application
- Configuring Finger Service for Remote Access to the Router
- Configuring FTP Service for Remote Access to the Router or Switch
- Configuring SSH Service for Remote Access to the Router or Switch
- Configuring Telnet Service for Remote Access to a Router

crl (Encryption Interface)

Syntax crl *file-name*;

Hierarchy Level [edit security **certificates**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Configure the certificate revocation list (CRL). A CRL is a time-stamped list identifying revoked certificates, which is signed by a CA and made available to the participating IPsec peers on a regular periodic basis.

Options ***file-name***—Specify the file from which to read the CRL.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration

default-lease-time

Syntax default-lease-time *seconds*;

Hierarchy Level [edit system services **dhcp**],
[edit system services dhcp **pool**],
[edit system services dhcp **static-binding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Specify the length of time in seconds that a client holds the lease for an IP address assigned by a DHCP server. This setting is used if a lease time is not requested by the client.

Options ***seconds***—Number of seconds the lease can be held.

Default: **86400** (1day)

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **maximum-lease-time on page 479**

description

Syntax description *text-description*;

Hierarchy Level [edit forwarding-options **helpers bootp**],
[edit forwarding-options **helpers bootpinterface** *interface-group*],
[edit forwarding-options **helpers domain**],
[edit forwarding-options **helpers domain interface** *interface-name*],
[edit forwarding-options **helpers tftp**],
[edit forwarding-options **helpers tftpinterface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Describe a BOOTP, DHCP, Domain Name System (DNS), or Trivial File Transfer Protocol (TFTP) service, or an interface that is configured for the service.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring DNS and TFTP Packet Forwarding
- Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents

dhcp

Syntax

```
dhcp {
  boot-file filename;
  boot-server (address | hostname);
  default-lease-time seconds;
  domain-name domain-name;
  domain-search [domain-list];
  maximum-lease-time seconds;
  name-server {
    address;
  }
  option {
    [ (id-number option-type option-value) | (id-number array option-type option-value) ];
  }
  pool address/prefix-length {
    address-range {
      low address;
      high address;
    }
    exclude-address {
      address;
    }
  }
  router {
    address;
  }
  static-binding mac-address {
    fixed-address {
      address;
    }
    host hostname;
    client-identifier (ascii client-id | hexadecimal client-id);
  }
  server-identifier address;
  wins-server {
    address;
  }
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Configure a router, switch, or interface as a DHCP server. A DHCP server can allocate network addresses and deliver configuration information to client hosts on a TCP/IP network.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- System Management Configuration Statements

domain

Syntax

```
domain {
  description text-description;
  interface interface-name {
    broadcast;
    description text-description;
    no-listen;
    server address <logical-system logical-system-name> <routing-instance
      routing-instance-name>;
  }
  server address <logical-system logical-system-name> <routing-instance
    routing-instance-name>;
}
```

Hierarchy Level [edit forwarding-options **helpers**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable DNS request packet forwarding.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring DNS and TFTP Packet Forwarding

domain-name (DHCP)

Syntax domain-name *domain-name*;

Hierarchy Level [edit system services **dhcp**],
[edit system services dhcp **pool**],
[edit system services dhcp **static-binding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches only. Configure the name of the domain in which clients search for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified.

Options *domain-name*—Name of the domain.

domain-search

Syntax domain-search [*domain-list*];

Hierarchy Level [edit system],
[edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a list of domains to be searched.

Options ***domain-list***—A list of domain names to search. The list can contain up to six domain names, with a total of up to 256 characters.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Domains to Search When a Router or Switch Is Included in Multiple Domains

encoding

Syntax encoding (binary | pem);

Hierarchy Level [edit security ike policy *ike-peer-address*],
[edit security certificates **certification-authority** *ca-profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Specify the file format used for the **local-certificate** and **local-key-pair** statements.

Options **binary**—Binary file format.

pem—Privacy-enhanced mail (PEM), an ASCII base 64 encoded format.

Default: binary

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

enrollment-retry

Syntax enrollment-retry *attempts*;

Hierarchy Level [edit security **certificates**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Specify how many times a router or switch can resend a digital certificate request.

Options ***attempts***—Number of enrollment retries.
Range: **0** through **100**
Default: **0**

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

enrollment-url

Syntax enrollment-url *url-name*;

Hierarchy Level [edit security certificates **certification-authority** *ca-profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Specify where your router or switch sends Simple Certificate Enrollment Protocol-based (SCEP-based) certificate enrollment requests (certificate authority URL).

Options ***url-name***—Certificate authority URL.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

file

Syntax file *certificate-filename*;

Hierarchy Level [edit security certificates **certification-authority** *ca-profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Specify the file from which to read the digital certificate.

Options ***certificate-filename***—File from which to read the digital certificate.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

ftp

Syntax
```
ftp {
    connection-limit limit;
    rate-limit limit;
}
```

Hierarchy Level [edit system **services**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Allow FTP requests from remote systems to the local router or switch.

Options The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

helpers

Syntax

```
helpers {
  bootp {
    client-response-ttl number;
    description text-description;
    interface interface-group {
      client-response-ttl number;
      description text-description;
      maximum-hop-count number;
      minimum-wait-time seconds;
      no-listen;
      server address {
        <logical-system logical-system-name>
          <routing-instance [ routing-instance-names ]>;
      }
    }
    maximum-hop-count number;
    minimum-wait-time seconds;
    server address {
      <logical-system logical-system-name>
        <routing-instance [ routing-instance-names ]>;
    }
  }
  domain {
    description text-description;
    interface interface-name {
      broadcast;
      description text-description;
      no-listen;
      server address <logical-system logical-system-name> <routing-instance
        routing-instance-name>;
    }
    server address <logical-system logical-system-name> <routing-instance
      routing-instance-name>;
  }
  port port-number {
    description text-description;
    interface interface-name {
      broadcast;
      description text-description;
      no-listen;
      server address <logical-system logical-system-name> <routing-instance
        routing-instance-name>;
    }
    server address <logical-system logical-system-name> <routing-instance
      routing-instance-name>;
  }
  tftp {
    description text-description;
    interface interface-name {
      broadcast;
      description text-description;
      no-listen;
```

```
        server address <logical-system logical-system-name> <routing-instance
          routing-instance-name>;
      }
      server address <logical-system logical-system-name> <routing-instance
        routing-instance-name>;
    }
    traceoptions {
      file filename <files number> <match regular-expression> <size bytes> <world-readable |
        no-world-readable>;
      flag flag;
      level level;
      no-remote-trace level;
    }
}
```

Hierarchy Level [edit forwarding-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable TFTP or DNS request packet forwarding, or configure the router, switch, or interface to act as a DHCP/BOOTP relay agent. Use only one server address per interface or global configuration.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring DNS and TFTP Packet Forwarding

http

Syntax

```
http {
  interfaces [ interface-names ];
  port port;
}
```

Hierarchy Level [edit system **services web-management**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port and interfaces for HTTP service, which is unencrypted.

Options

interfaces [*interface-names*]—Name of one or more interfaces on which to allow the HTTP service. By default, HTTP access is allowed through built-in Fast Ethernet or Gigabit Ethernet interfaces only.

The remaining statement is explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *J-Web Interface User Guide*
- **https on page 473**
- **port on page 486**
- **web-management on page 506**

https

Syntax

```
https {
  interfaces [ interface-names ];
  local-certificate name;
  port port;
}
```

Hierarchy Level [edit system **services web-management**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the secure version of HTTP (HTTPS) service, which is encrypted.

Options

interfaces [***interface-names*****]**—Name of one or more interfaces on which to allow the HTTPS service. By default, HTTPS access is allowed through any ingress interface, but HTTP access is allowed through built-in Fast Ethernet or Gigabit Ethernet interfaces only.

local-certificate ***name***—Name of the X.509 certificate for a Secure Sockets Layer (SSL) connection. An SSL connection is configured at the **[edit security certificates local]** hierarchy.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

interface (BOOTP)

Syntax

```
interface interface-group {
  client-response-ttl number;
  description text-description;
  maximum-hop-count number;
  minimum-wait-time seconds;
  no-listen;
  server address {
    <logical-system logical-system-name> <routing-instance [ routing-instance-names ]>;
  }
}
```

Hierarchy Level [edit forwarding-options **helpers bootp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the interface for a DHCP and BOOTP relay agent.

Options ***interface-group***—Sets a logical interface or group of logical interfaces with a specific DHCP relay configuration.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents
- Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure) on page 2646

interface (DNS and TFTP Packet Forwarding or Relay Agent)

Syntax

```
interface interface-name {
  broadcast;
  description text-description;
  no-listen;
  server address <logical-system logical-system-name> <routing-instance
    routing-instance-name>;
}
```

Hierarchy Level [edit forwarding-options **helpers domain**],
[edit forwarding-options **helpers tftp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the interface for monitoring and forwarding DNS or TFTP requests.

Options ***interface-name***—Name of the interface.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring DNS and TFTP Packet Forwarding

ldap-url

Syntax <ldap-url *url-name*>;

Hierarchy Level [edit security certificates **certification-authority** *ca-profile-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) (Optional) Specify the Lightweight Directory Access Protocol (LDAP) URL for digital certificates.

Options ***url-name***—Name of the LDAP URL.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

load-key-file

Syntax load-key-file;

Hierarchy Level [edit system root-authentication],
[edit system login user *username* authentication]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Load RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a file. The file is a URL containing one or more SSH keys.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring the Root Password

local

Syntax

```
local certificate-name {
    certificate-key-string;
    load-key-file URL-or-path;
}
```

Hierarchy Level [edit security certificates]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Import a paired X.509 private key and authentication certificate, to enable Junos XML management protocol client applications to establish Secure Sockets Layer (SSL) connections to the router or switch.

Options

certificate-key-string—String of alphanumeric characters that constitute the private key and certificate.

certificate-name—Name that uniquely identifies the certificate.

load-key-file *URL-or-path*—File that contains the private key and certificate. It can be one of two types of values:

- Pathname of a file on the local disk (assuming you have already used another method to copy the certificate file to the router's or switch's local disk)
- URL to the certificate file location (for instance, on the computer where the Junos XML management protocol client application runs)

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Importing SSL Certificates for Junos XML Management Protocol Support

local-certificate

Syntax local-certificate;

Hierarchy Level [edit system services service-deployment],
[edit system services web-management https],
[edit system services xnm-ssl]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Import or reference an SSL certificate.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring clear-text or SSL Service for Junos XML Management Protocol Client Applications
- Generating SSL Certificates to Be Used for Secure Web Access on page 398
- Importing SSL Certificates for Junos XML Management Protocol Support

maximum-certificates

Syntax maximum-certificates *number*;

Hierarchy Level [edit security certificates]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Configure the maximum number of peer digital certificates to be cached.

Options *number*—Maximum number of peer digital certificates to be cached.
Range: 64 through 4,294,967,295 peer certificates
Default: 1024 peer certificates

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

maximum-hop-count

Syntax maximum-hop-count *number*;

Hierarchy Level [edit forwarding-options **helpers bootp**],
[edit forwarding-options **helpers bootpinterface** *interface-group*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum number of hops allowed.

Options ***number***—Maximum number of hops.
Default: 4 hops

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

maximum-lease-time

Syntax maximum-lease-time *seconds*;

Hierarchy Level [edit system services dhcp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches. Specify the maximum length of time in seconds for which a client can request and hold a lease on a DHCP server.

An exception is that the dynamic BOOTP lease length can exceed the maximum lease length specified.

Options ***seconds***—The maximum number of seconds the lease can be held.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration

Related Documentation

- **default-lease-time on page 463**

minimum-wait-time

Syntax minimum-wait-time *seconds*;

Hierarchy Level [edit forwarding-options **helpers bootp**],
[edit forwarding-options **helpers bootpinterface** *interface-group*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the minimum time allowed.

Options ***seconds***—Minimum time.

Default: 0 seconds

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

name-server

Syntax
```
name-server {
  address;
}
```

Hierarchy Level [edit system],
[edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure one or more Domain Name System (DNS) name servers.

Options ***address***—Address of the name server. To configure multiple name servers, include multiple ***address*** options.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring a DNS Name Server for Resolving a Hostname into Addresses

no-listen

Syntax no-listen;

Hierarchy Level [edit forwarding-options **helpers bootp interface***interface-group*],
[edit forwarding-options **helpers domain interface** *interface-name*],
[edit forwarding-options **helpers tftp interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable recognition of DNS requests or stop packets from being forwarded on a logical interface, a group of logical interfaces, a router, or a switch.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring DNS and TFTP Packet Forwarding

outbound-ssh

Syntax

```
[edit system services]
outbound-ssh {
  client client-id {
    address {
      port port-number;
      retry number;
      timeout seconds;
    }
    device-id device-id;
    keep-alive {
      retry number;
      timeout seconds;
    }
    reconnect-strategy (in-order | sticky);
    secret password;
    services netconf;
  }
  traceoptions {
    file filename <files number> <match regex> <size size> <world-readable |
      no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a router or switch running the Junos OS behind a firewall to communicate with client management applications on the other side of the firewall.

Default To configure transmission of the router's or switch's device ID to the application, include the **device-id** statement at the **[edit system services]** hierarchy level.

Options

client-id—Identifies the **outbound-ssh** configuration stanza on the router or switch. Each **outbound-ssh** stanza represents a single outbound SSH connection. This attribute is not sent to the client.

device-id—Identifies the router or switch to the client during the initiation sequence.

keep-alive—(Optional) When configured, specifies that the router or switch send keepalive messages to the management server. To configure the keepalive message, you must set both the **timeout** and **retry** attributes.

reconnect-strategy—(Optional) Specify the method the router or switch uses to reestablish a disconnected outbound SSH connection. Two methods are available:

- **in-order**—Specify that the router or switch first attempt to establish an outbound SSH session based on the management server address list. The router or switch attempts

to establish a session with the first server on the list. If this connection is not available, the router or switch attempts to establish a session with the next server, and so on down the list until a connection is established.

- **sticky**—Specify that the router or switch first attempt to reconnect to the management server that it was last connected to. If the connection is unavailable, it attempts to establish a connection with the next client on the list and so forth until a connection is made.

retry—Number of keepalive messages the router or switch sends without receiving a response from the client before the current SSH connection is disconnected. The default is three messages.

secret—(Optional) Router's or switch's public SSH host key. If added to the **outbound-ssh** statement, during the initialization of the outbound SSH service, the router or switch passes its public key to the management server. This is the recommended method of maintaining a current copy of the router's or switch's public key.

timeout—Length of time that the Junos OS server waits for data before sending a keep alive signal. The default is 15 seconds.

When reconnecting to a client, the router or switch attempts to reconnect to the client based on the **retry** and **timeout** values for each client listed.

address—Hostname or the IPv4 address of the NSM application server. You can list multiple clients by adding each client's IP address or hostname along with the following connection parameters:

- **port**—Outbound SSH port for the client. The default is port 22.
- **retry**—Number of times the router or switch attempts to establish an outbound SSH connection before giving up. The default is three tries.
- **timeout**—Length of time that the router or switch attempts to establish an outbound SSH connection before giving up. The default is fifteen seconds.

filename—(Optional) By default, the filename of the log file used to record the trace options is the name of the traced process (for example, **mib2d** or **snmpd**). Use this option to override the default value.

files—(Optional) Maximum number of trace files generated. By default, the maximum number of trace files is 10. Use this option to override the default value.

When a trace file reaches its maximum size, the system archives the file and starts a new file. The system archives trace files by appending a number to the filename in sequential order from 1 to the maximum value (specified by the default value or the options value set here). Once the maximum value is reached, the numbering sequence is restarted at 1, overwriting the older file.

size—(Optional) Maximum size of the trace file in kilobytes (KB). Once the maximum file size is reached, the system archives the file. The default value is 1000 KB. Use this option to override the default value.

match—(Optional) When used, the system only adds lines to the trace file that match the regular expression specified. For example, if the match value is set to **=error**, the system only records lines to the trace file that include the string **error**.

services—Services available for the session. Currently, NETCONF is the only service available.

world-readable | no-world-readable—(Optional) Whether the files are accessible by the originator of the trace operation only or by any user. By default, log files are only accessible by the user that started the trace operation (**no-world-readable**).

all | configuration | connectivity—(Optional) Type of tracing operation to perform.

all—Log all events.

configuration—Log all events pertaining to the configuration of the router or switch.

connectivity—Log all events pertaining to the establishment of a connection between the client server and the router or switch.

no-remote-trace—(Optional) Disable remote tracing.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring Outbound SSH Service
- System Management Configuration Statements

path-length

Syntax
path-length *certificate-path-length*;

Hierarchy Level
[edit security **certificates**]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
(Encryption interface on J-EX Series switches) Configure the digital certificate path length.

Options
certificate-path-length—Digital certificate path length.
Range: 2 through 15 certificates
Default: 15 certificates

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

pool

Syntax

```
pool address/prefix-length {
  address-range {
    low address;
    high address;
  }
  exclude-address {
    address;
  }
}
```

Hierarchy Level [edit system services dhcp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches . Configure a pool of IP addresses for DHCP clients on a subnet. When a client joins the network, the DHCP server dynamically allocates an IP address from this pool.

Options

address-range—Lowest and highest IP addresses in the pool that are available for dynamic address assignment. If no range is specified, the pool will use all available addresses within the subnet specified. (Broadcast addresses, interface addresses, and excluded addresses are not available.)

exclude-address—Addresses within the range that are not used for dynamic address assignment. You can exclude one or more addresses within the range.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

port (HTTP/HTTPS)

Syntax port *port-number*;

Hierarchy Level [edit system **services web-management**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port on which the HTTP or HTTPS service is connected.

Options ***port-number***—The TCP port number on which the specified service listens.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

port (SRC Server)

Syntax port *port-number*;

Hierarchy Level [edit system services service-deployment servers *server-address*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the port number on which to contact the SRC server.

Options ***port-number***—(Optional) The TCP port number for the SRC server.
Default: 3333

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Work with SRC Software

protocol-version

Syntax protocol-version *version*;

Hierarchy Level [edit system services ssh]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the secure shell (SSH) protocol version.

Options ***version***—SSH protocol version
Values: v1, u2, or [v1 v2]
Default: [v1 v2]

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- Configuring SSH Service for Remote Access to the Router or Switch

rate-limit

Syntax rate-limit *limit*;

Hierarchy Level [edit system services finger],
[edit system services ftp],
[edit system services ssh],
[edit system services telnet],
[edit system services xnm-clear-text],
[edit system services xnm-ssl]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Maximum number of connection attempts on an access service.

Options **rate-limit *limit***—(Optional) Maximum number of connection attempts allowed per minute.
Range: 1 through 250
Default: 150

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring clear-text or SSL Service for Junos XML Management Protocol Client Applications

server (DHCP and BOOTP Relay Agent)

Syntax

server *address* {
  <logical-system *logical-system-name*> <routing-instance [*routing-instance-names*]>;
}

Hierarchy Level

[edit forwarding-options **helpers bootp**],
[edit forwarding-options **helpers bootp interface** *interface-group*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure the router or switch to act as a DHCP and BOOTP relay agent.

Options

- ***address***—One or more addresses of the server.
- **logical-system *logical-system-name***—(Optional) Logical system of the server.
- **routing-instance [*routing-instance-names*]**—(Optional) Routing instance name or names that belong to the DHCP or BOOTP relay agent.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents

server (DNS and TFTP Service)

Syntax server *address* <logical-system *logical-system-name*> <routing-instance *routing-instance-name*>;

Hierarchy Level [edit forwarding-options **helpers domain**],
[edit forwarding-options **helpers domain interface** *interface-name*],
[edit forwarding-options **helpers tftp**],
[edit forwarding-options **helpers tftp interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the DNS or TFTP server for forwarding DNS or TFTP requests. Only one server can be specified for each interface.

Options ***address***—Address of the server.

logical-system *logical-system-name*—(Optional) Logical system of the server.

routing-instance [*routing-instance-names*]—(Optional) Set the routing instance name or names that belong to the DNS server or TFTP server.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring DNS and TFTP Packet Forwarding

server-identifier

Syntax server-identifier *address*;

Hierarchy Level [edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches . Configure a server identifier. The identifier can be used to identify a DHCP server in a DHCP message. It can also be used as a destination address from clients to servers (for example, when the boot file is set, but not the boot server).

Servers include the server identifier in **DHCPOFFER** messages so that clients can distinguish between multiple lease offers. Clients include the server identifier in **DHCPREQUEST** messages to select a lease and indicate which offer is accepted from multiple lease offers. Also, clients can use the server identifier to send unicast request messages to specific DHCP servers to renew a current lease.

This address must be a manually assigned, static IP address. The server cannot send a request and receive an IP address from itself or another DHCP server.

Default If no server identifier is set, the DHCP server sets the server identifier based on the primary interface address used by the server to receive a client request. For example, if the client sends a DHCP request and the server receives it on **fe-0/0/0** and the primary interface address is **1.1.1.1**, then the server identifier is set to **1.1.1.1**.

Options ***address***—IPv4 address of the server. This address must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

servers

Syntax

```
servers server-address {
    port port-number;
}
```

Hierarchy Level [edit system services service-deployment]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an IPv4 address for the Session and Resource Control (SRC) server.

Options *server-address*—The TCP port number.

Default: 3333

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Work with SRC Software

service-deployment

Syntax

```
service-deployment {
    servers server-address {
        port port-number;
    }
    source-address source-address;
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable Junos OS to work with the Session and Resource Control (SRC) software.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring the Junos OS to Work with SRC Software

services

Syntax

```
services {
  dhcp {
    dhcp_services;
  }
  finger {
    <connection-limit limit>;
    <rate-limit limit>;
  }
  ftp {
    <connection-limit limit>;
    <rate-limit limit>;
  }
  ssh {
    protocol-version [v1 v2];
    <connection-limit limit>;
    <rate-limit limit >;
    root-login (allow | deny | deny-password);
  }
  service-deployment {
    servers server-address {
      port-number port-number;
    }
    source-address source-address;
  }
  telnet {
    <connection-limit limit>;
    <rate-limit limit>;
  }
  web-management {
    http {
      interfaces [ interface-names ];
      port port;
    }
    https {
      interfaces [ interface-names ];
      local-certificate name;
      port port;
    }
    session {
      idle-timeout [ minutes ];
      session-limit [ session-limit ];
    }
  }
  xnm-clear-text {
    <connection-limit limit>;
    <rate-limit limit>;
  }
  xnm-ssl {
    <connection-limit limit>;
    <local-certificate name>
    <rate-limit limit>;
  }
```

}

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the router or switch so that users on remote systems can access the local router or switch through the DHCP server, finger, rlogin, SSH, telnet, Web management, Junos XML management protocol clear-text, Junos XML management protocol SSL, and network utilities or enable Junos OS to work with the Session and Resource Control (SRC) software.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring clear-text or SSL Service for Junos XML Management Protocol Client Applications
- Configuring Junos OS to Work with SRC Software

session

Syntax

```
session {
  idle-timeout [ minutes ];
  session-limit [ session-limit ];
}
```

Hierarchy Level [edit system **services web-management**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure limits for the number of minutes a session can be idle before it times out, and configure the number of simultaneous J-Web user login sessions.

Options

idle-timeout *minutes*—Configure the number of minutes a session can be idle before it times out.

Range: 1 through 1440

Default: 1440

session-limit *session-limit*—Configure the maximum number of simultaneous J-Web user login sessions.

Range: 1 through 1024

Default: Unlimited

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *J-Web Interface User Guide*

sip-server

Syntax sip-server [*address* | *name*];

Hierarchy Level [edit system **services dhcp**],
[edit system **services dhcp pool**],
[edit system **services dhcp static-binding**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Session Initiation Protocol (SIP) server addresses or names for DHCP servers.

Options ***address***—IPv4 address of the SIP server. To configure multiple SIP servers, include multiple ***address*** options. This address must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).

name—Fully qualified domain name of the SIP server. To configure multiple SIP servers, include multiple ***name*** options. This domain name must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring a DHCP SIP Server on page 450

source-address (SRC Software)

Syntax source-address *source-address*;

Hierarchy Level [edit system services service-deployment]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the Junos OS to work with the Session and Resource Control (SRC) software.

Options ***source-address***— Local IPv4 address to be used as source address for traffic to the SRC server. The source address restricts traffic within the out-of-band network.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring the Junos OS to Work with SRC Software

source-address-giaddr

Syntax source-address-giaddr;

Hierarchy Level [edit forwarding-options helpers bootp],
[edit forwarding-options helpers bootp interface *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the gateway IP address (giaddr) as the source IP address of the switch for relayed DHCP packets when the switch is used as the DHCP relay agent.

When this statement is entered in the [**edit forwarding-options helpers bootp**] hierarchy, the gateway IP address is configured as the source IP address of the switch for relayed DHCP packets exiting all interfaces on the switch.

When this statement is entered in the [**edit forwarding-options helpers bootp interface *interface-name***] hierarchy, the gateway IP address is configured as the source IP address of the switch for relayed DHCP packets exiting the specified interface of the switch.

The IP address of the interface that the DHCP packet exits on the switch acting as a DHCP relay agent is used as the source IP address for relayed DHCP packets by default.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- DHCP/BOOTP Relay for J-EX Series Switches Overview on page 446

ssh

Syntax
```
ssh {
  protocol-version [v1 v2];
  <connection-limit limit>;
  <rate-limit limit>;
  root-login (allow | deny | deny-password);
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Allow SSH requests from remote systems to the local router or switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Configuring SSH Service for Remote Access to the Router or Switch

static-binding

Syntax

```
static-binding mac-address {
  client-identifier (ascii client-id | hexadecimal client-id);
  fixed-address {
    address;
  }
  host client-hostname;
}
```

Hierarchy Level [edit system services **dhcp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches . Set static bindings for DHCP clients. A static binding is a mapping between a fixed IP address and the client's MAC address or client identifier.

Options

mac-address—The MAC address of the client. This is a hardware address that uniquely identifies a client on the network.

fixed-address *address*—Fixed IP address assigned to the client. Typically a client has one address assigned, but you can assign more.

host *client-hostname*—Hostname of the client requesting the DHCP server. The name can include the local domain name. Otherwise, the name is resolved based on the **domain-name** statement.

client-identifier (ascii *client-id* | hexadecimal *client-id*)—Used by the DHCP server to index the database of address bindings. The client identifier is an ASCII string or hexadecimal number and can include a type-value pair as specified in RFC 1700, *Assigned Numbers*. Either a client identifier or the client's MAC address must be configured to uniquely identify the client on the network.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

telnet

Syntax

```
telnet {
  connection-limit limit;
  rate-limit limit;
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Allow Telnet connections from remote systems to the local router or switch.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

tftp

Syntax

```
tftp {
  description text-description;
  interface interface-name {
    broadcast;
    description text-description;
    no-listen;
    server address <logical-system logical-system-name> <routing-instance
      routing-instance-name>;
  }
  server address <logical-system logical-system-name> <routing-instance
    routing-instance-name>;
}
```

Hierarchy Level [edit forwarding-options helpers]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable TFTP request packet forwarding.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring DNS and TFTP Packet Forwarding

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <size size>;
  flag all;
  flag database;
  flag general;
  flag ike;
  flag parse;
  flag policy-manager;
  flag routing-socket;
  flag timer;
}
```

Hierarchy Level

[edit security],
[edit services ipsec-vpn]

Trace options can be configured at either the **[edit security]** or the **[edit services ipsec-vpn]** hierarchy level, but not at both levels.

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure security trace options.

To specify more than one trace option, include multiple **flag** statements. Trace option output is recorded in the **/var/log/kmd** file.

Options

files ***number***—(Optional) Maximum number of trace files. When a trace file (for example, **kmd**) reaches its maximum size, it is renamed **kmd.0**, then **kmd.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 0 files

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB). When a trace file (for example, **kmd**) reaches this size, it is renamed, **kmd.0**, then **kmd.1** and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Default: 1024 KB

flag—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.

- **all**—Trace all security events.
- **database**—Trace database events.
- **general**—Trace general events.
- **ike**—Trace IKE module processing.

- **parse**—Trace configuration processing.
- **policy-manager**—Trace policy manager processing.
- **routing-socket**—Trace routing socket messages.
- **timer**—Trace internal timer events.

Required Privilege Level

admin—To view the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- Configuring Tracing Operations for Security Services

traceoptions (DHCP Server)

Syntax

```
traceoptions {
  file filename <files number> <match regex> <size size> <world-readable |
    no-world-readable>;
  flag flag;
}
```

Hierarchy Level [edit system services **dhcp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for DHCP processes for J-EX Series switches.

Options

file *filename*—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

Range: **2** through **1000**

Default: **3** files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—All tracing operations
- **binding**—Trace binding operations
- **config**—Log reading of configuration
- **conflict**—Trace user-detected conflicts for IP addresses
- **event**—Trace important events
- **ifdb**—Trace interface database operations
- **io**— Trace I/O operations
- **lease**—Trace lease operations
- **main**—Trace main loop operations
- **misc**— Trace miscellaneous operations
- **packet**—Trace DHCP packets
- **options**—Trace DHCP options
- **pool**—Trace address pool operations

- **protocol**—Trace protocol operations
- **rtsock**—Trace routing socket operations
- **scope**—Trace scope operations
- **signal**—Trace DHCP signal operations
- **trace**—All tracing operations
- **ui**—Trace user interface operations

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

- **all**—All tracing operations
- **binding**—Trace binding operations
- **config**— Log reading of configuration
- **conflict**—Trace user-detected conflicts for IP addresses
- **event**—Trace important events
- **ifdb**— Trace interface database operations
- **io**—Trace I/O operations
- **lease**—Trace lease operations
- **main**—Trace main loop operations
- **match *regex***— Refine the output to include lines that contain the regular expression.
- **misc**—Trace miscellaneous operations
- **packet**—Trace DHCP packets
- **options**—Trace DHCP options
- **pool**—Trace address pool operations
- **protocol**—Trace protocol operations
- **rtsock**—Trace routing socket operations
- **scope**—Trace scope operations
- **signal**—Trace DHCP signal operations
- **trace**—All tracing operations
- **ui**—Trace user interface operations

no-world-readable—(Optional) Disable unrestricted file access.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring Tracing Operations for DHCP Processes
- System Management Configuration Statements

traceoptions (DNS and TFTP Packet Forwarding)

Syntax

```
traceoptions {
  file filename <files number> <match regular-expression> <size bytes> <world-readable |
    no-world-readable>;
  flag flag;
  level level;
  <no-remote-trace>;
}
```

Hierarchy Level [edit forwarding-options **helpers**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure tracing operations for BOOTP, DNS and TFTP packet forwarding.

Default If you do not include this statement, no tracing operations are performed.

Options

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named **fud** in the directory **/var/log**. If you include the **file** statement, you must specify a filename.

files ***number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

Range: 2 through 1000

Default: 3 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **address**—Trace address management events
- **all**—Trace all events
- **bootp**—Trace BOOTP or DHCP services events
- **config**—Trace configuration events
- **domain**—Trace DNS service events
- **ifdb**—Trace interface database operations
- **io**—Trace I/O operations
- **main**—Trace main loop events
- **port**—Trace arbitrary protocol events
- **rtsock**—Trace routing socket operations

- **tftp**—Trace TFTP service events
- **trace**—Trace tracing operations
- **ui**—Trace user interface operations
- **util**—Trace miscellaneous utility operations

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace—(Optional) Disable remote tracing globally or for a specific tracing operation.

no-world-readable—(Optional) Restrict file access to the owner.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 0 bytes through 4,294,967,295 KB

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Tracing BOOTP, DNS, and TFTP Forwarding Operations

web-management

Syntax

```
web-management {
  http {
    interfaces [ interface-names ];
    port port;
  }
  https {
    interfaces [ interface-names ];
    local-certificate name;
    port port;
  }
}
```

Hierarchy Level [edit system services]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure settings for HTTP or HTTPS access. HTTP access allows management of the router or switch using the browser-based J-Web graphical user interface. HTTPS access allows secure management of the router or switch using the J-Web interface. With HTTPS access, communication between the router or switch Web server and your browser is encrypted.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

wins-server

Syntax

```
wins-server {
  address;
}
```

Hierarchy Level [edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX Series switches . Specify one or more NetBIOS Name Servers. When a DHCP client is added to the network and assigned an IP address, the NetBIOS Name Server manages the Windows Internet Name Service (WINS) database that matches IP addresses (such as **192.168.1.3**) to Windows NetBIOS names (such as **\\Marketing**). List servers in order of preference.

Options ***address***—IPv4 address of the NetBIOS Name Server running WINS. To configure multiple servers, include multiple ***address*** options.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

CHAPTER 38

Operational Mode Commands for System Services

clear system services dhcp binding

Syntax clear system services dhcp binding
<*address*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Remove obsolete IP address bindings on a Dynamic Host Configuration Protocol (DHCP) server and return them to the IP address pool.

Options *address*—(Optional) Remove a specific IP address binding and return it to the address pool.

Required Privilege Level view and system

Related Documentation
- **show system services dhcp binding on page 517**

Output Fields When you enter this command, you are provided feedback on the status of your request.

clear system services dhcp binding

```
user@host> clear system services dhcp binding
```

clear system services dhcp conflict

Syntax clear system services dhcp conflict
<*address*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Remove IP addresses from the Dynamic Host Configuration Protocol (DHCP) server conflict list and return them to the IP address pool.

Options *address*—(Optional) Remove a specific IP address from the conflict list and return it to the address pool.

Required Privilege Level view and system

Related Documentation
- **show system services dhcp conflict on page 519**

Output Fields When you enter this command, you are provided feedback on the status of your request.

clear system services dhcp conflict

```
user@host> clear system services dhcp conflict
```

clear system services dhcp statistics

Syntax clear system services dhcp statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Clear Dynamic Host Configuration Protocol (DHCP) server statistics.

Options This command has no options.

Required Privilege Level view and system

Related Documentation

- **show system services dhcp statistics on page 524**

List of Sample Output **clear system services dhcp statistics on page 512**

Output Fields When you enter this command, you are provided feedback on the status of your request.

clear system services dhcp statistics

```
user@host> clear system services dhcp statistics
```

request ipsec switch

Syntax request ipsec switch (interface <es-*fpc/pic/port*> | security-associations <*sa-name*>)

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Manually switch from the primary to the backup encryption services interface, or switch from the primary to the backup IP Security (IPsec) tunnel.

Options interface <es-*fpc/pic/port*>—Switch to the backup encryption interface.

security-associations <*sa-name*>—Switch to the backup tunnel.

Required Privilege Level view

Related Documentation
- show ipsec redundancy

List of Sample Output **request ipsec switch on page 513**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request ipsec switch

```
user@host> request ipsec switch security-associations sa-private
```

request security certificate (signed)

Syntax request security certificate enroll filename *filename* subject *subject* alternative-subject *alternative-subject* certification-authority *certification-authority* encoding (binary | pem) key-file *key-file* domain-name *domain-name*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Obtain a signed certificate from a certificate authority (CA). The signed certificate validates the CA and the owner of the certificate. The results are saved in a specified file to the **/var/etc/ikecert** directory.

Options filename *filename*—File that stores the certificate.

subject *subject*—Distinguished name (**dn**), which consists of a set of components—for example, an organization (**o**), an organization unit (**ou**), a country (**c**), and a locality (**l**).

alternative-subject *alternative-subject*—Tunnel source address.

certification-authority *certification-authority*—Name of the certificate authority profile in the configuration.

encoding (binary | pem)—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default format is binary.

key-file *key-file*—File containing a local private key.

domain-name *domain-name*—Fully qualified domain name.

Required Privilege Level maintenance

List of Sample Output **request security certificate (signed) on page 514**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request security certificate (signed)

```
user@host> request security certificate enroll filename host.crt subject c=uk,o=london
alternative-subject 10.50.1.4 certification-authority verisign  key-file host-1.prv domain-name
host.juniper.net
CA name: juniper.net CA file: ca_verisign
local pub/private key pair: host.prv
subject: c=uk,o=london domain name: host.juniper.net
alternative subject: 10.50.1.4
Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check
 the key management process (kmd) log file at /var/log/kmd. <--------------
```

request security key-pair

Syntax
request security key-pair *filename*
<size *key-size*>
<type (rsa | dsa)>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
(Encryption interface on J-EX Series switches) Generate a public and private key pair for a digital certificate.

Options
filename—Name of a file in which to store the key pair.

size *key-size*—(Optional) Key size, in bits. The key size can be **512**, **1024**, or **2048**. The default value is **1024**.

type—(Optional) Algorithm used to encrypt the key:

- **rsa**—RSA algorithm. This is the default.
- **dsa**—Digital signature algorithm with Secure Hash Algorithm (SHA).

Required Privilege Level
maintenance

List of Sample Output
request security key-pair on page 515

Output Fields
When you enter this command, you are provided feedback on the status of your request.

request security key-pair
`user@host>` **request security key-pair security-key-file**

request security certificate (unsigned)

Syntax request security certificate enroll filename *filename* ca-file *ca-file* ca-name *ca-name* encoding (binary | perm) url *url*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (Encryption interface on J-EX Series switches) Obtain a certificate from a certificate authority (CA). The results are saved in a specified file to the **/var/etc/ikecert** directory.

Options

filename *filename*—File that stores the public key certificate.

ca-file *ca-file*—Name of the certificate authority profile in the configuration.

ca-name *ca-name*—Name of the certificate authority.

encoding (binary | pem)—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default value is **binary**.

url *url*—Certificate authority URL.

Required Privilege Level maintenance

List of Sample Output **request security certificate (unsigned) on page 516**

Output Fields When you enter this command, you are provided feedback on the status of your request.

request security certificate (unsigned)

```
user@host> request security certificate enroll filename ca_verisign ca-file verisign ca-name
juniper.net urlxyzcompany URL
http://<verisign ca-name xyzcompany url>/cgi-bin/pkiclient.exe CA name: juniper.net
 CA file: verisign Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check
 the key management process (kmd) log file at /var/log/kmd. <--------------
```

show system services dhcp binding

Syntax show system services dhcp binding
<detail>
<*address*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Dynamic Host Configuration Protocol (DHCP) server client binding information.

Options none—Display brief information about all active client bindings.

detail—(Optional) Display detailed information about all active client bindings.

address—(Optional) Display detailed client binding information for the specified IP address only.

Required Privilege Level view and system

Related Documentation
- **clear system services dhcp binding on page 510**

List of Sample Output
show system services dhcp binding on page 518
show system services dhcp binding address on page 518
show system services dhcp binding address detail on page 518

Output Fields Table 62 on page 517 describes the output fields for the **show system services dhcp binding** command. Output fields are listed in the approximate order in which they appear.

Table 62: show system services dhcp binding Output Fields

Field Name	Field Description	Level of Output
Allocated address	List of IP addresses the DHCP server has assigned to clients.	All levels
MAC address	Corresponding media access control (MAC) hardware address of the client.	All levels
Client identifier	(***address*** option only) Client's unique identifier (represented by an ASCII string or hexadecimal digits). This identifier is used by the DHCP server to index its database of address bindings.	All levels
Binding Type	Type of binding assigned to the client. DHCP servers can assign a dynamic binding from a pool of IP addresses or a static binding to one or more specific IP addresses.	All levels
Lease Expires at	Time the lease expires or **never** for leases that do not expire.	All levels
Lease Obtained at	(***address*** option only) Time the client obtained the lease from the DHCP server.	**detail**
State	Status of the binding. Bindings can be active or expired.	**detail**

Table 62: show system services dhcp binding Output Fields *(continued)*

Field Name	Field Description	Level of Output
Pool	Address pool that contains the IP address assigned to the client.	**detail**
Request received on	Interface on which the DHCP message exchange occurs. The IP address pool is configured based on the interface's IP address. If a relay agent is used, its IP address is also displayed.	**detail**
DHCP options	User-defined options created for the DHCP server. If no options have been defined, this field is blank.	**detail**

show system services dhcp binding

```
user@host> show system services dhcp binding

Allocated address   MAC address        Binding Type   Lease expires at
192.168.1.2         00:a0:12:00:12:ab  static         never
192.168.1.3         00:a0:12:00:13:02  dynamic        2004-05-03 13:01:42 PDT
```

show system services dhcp binding address

```
user@host> show system services dhcp binding 192.168.1.3

    Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
    Name: domain-name, Value: mydomain.tld
    Code: 19, Type: flag, Value: off
    Code: 40, Type: string, Value: domain.tld
    Code: 32, Type: ip-address, Value: 3.3.3.33
```

show system services dhcp conflict

Syntax show system services dhcp conflict

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Display Dynamic Host Configuration Protocol (DHCP) client-detected conflicts for IP addresses. When a conflict is detected, the DHCP server removes the address from the address pool.

Options This command has no options.

Required Privilege Level view and system

Related Documentation
- **clear system services dhcp conflict on page 511**

List of Sample Output **show system services dhcp conflict on page 519**

Output Fields Table 63 on page 519 describes the output fields for the **show system services dhcp conflict** command. Output fields are listed in the approximate order in which they appear.

Table 63: show system services dhcp conflict Output Fields

Field Name	Field Description
Detection time	Date and time the client detected the conflict.
Detection method	How the conflict was detected.
Address	IP address where the conflict occurs. The addresses in the conflicts list remain excluded from the pool until you use a **clear system services dhcp conflict** command to manually clear the list.

show system services dhcp conflict

```
user@host> show system services dhcp conflict

Detection time           Detection method  Address
2004-08-03 19:04:00 PDT  ARP               3.3.3.5
2004-08-04 04:23:12 PDT  Ping              4.4.4.8
2004-08-05 21:06:44 PDT  Client            3.3.3.10
```

show system services dhcp global

Syntax show system services dhcp global

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Display Dynamic Host Configuration Protocol (DHCP) global configuration options. Global options apply to all scopes and clients served by the DHCP server. Global options are overridden if specified otherwise in scope or client options. Scope options apply to specific subnets or ranges of addresses. Client options apply to specific clients.

Options This command has no options.

Required Privilege Level view and system

List of Sample Output **show system services dhcp global on page 521**

Output Fields Table 64 on page 520 describes the output fields for the **show system services dhcp global** command. Output fields are listed in the approximate order in which they appear.

Table 64: show system services dhcp global Output Fields

Field Name	Field Description
BOOTP lease length	Length of lease time assigned to BOOTP clients.
Default lease time	Lease time assigned to clients that do not request a specific lease time.
Minimum lease time	Minimum time a client retains an IP address lease on the server.
Maximum lease time	Maximum time a client can retain an IP address lease on the server.
DHCP options	User-defined options created for the DHCP server. If no options have been defined, this field is blank.

show system services dhcp global

```
user@host> show system services dhcp global

Global settings:
    BOOTP lease length         infinite

DHCP lease times:
    Default lease time         1 hour
    Minimum lease time         2 hours
    Maximum lease time         infinite

DHCP options:
    Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
    Name: domain-name, Value: mydomain.tld
    Code: 19, Type: flag, Value: off
    Code: 40, Type: string, Value: domain.tld
    Code: 32, Type: ip-address, Value: 3.3.3.33
```

show system services dhcp pool

Syntax show system services dhcp pool
<detail>
<*subnet-address*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Display Dynamic Host Configuration Protocol (DHCP) server IP address pools.

Options none—Display brief information about all IP address pools.

detail—(Optional) Display detailed information.

subnet-address—(Optional) Display information for the specified subnet address.

Required Privilege Level view and system

List of Sample Output **show system services dhcp pool on page 523**
show system services dhcp pool subnet-address on page 523
show system services dhcp pool subnet-address detail on page 523

Output Fields Table 65 on page 522 describes the output fields for the **show system services dhcp pool** command. Output fields are listed in the approximate order in which they appear.

Table 65: show system services dhcp pool Output Fields

Field Name	Field Description	Level of Output
Pool name	Subnet on which the IP address pool is defined.	None specified
Low address	Lowest address in the IP address pool.	None specified
High address	Highest address in the IP address pool.	None specified
Excluded addresses	Addresses excluded from the address pool.	None specified
Subnet	(***subnet-address*** option only) Subnet to which the specified address pool belongs.	None specified
Address range	(***subnet-address*** option only) Range of IP addresses in the address pool.	None specified
Addresses assigned	Number of IP addresses in the pool that are assigned to DHCP clients and the total number of IP addresses in the pool.	**detail**
Active	Number of assigned IP addresses in the pool that are active.	**detail**
Excluded	Number of assigned IP addresses in the pool that are excluded.	**detail**
Default lease time	Lease time assigned to clients that do not request a specific lease time.	**detail**

Table 65: show system services dhcp pool Output Fields *(continued)*

Field Name	Field Description	Level of Output
Minimum lease time	Minimum time a client can retain an IP address lease on the server.	**detail**
Maximum lease time	Maximum time a client can retain an IP address lease on the server.	**detail**
DHCP options	User-defined options created for the DHCP server. If no options have been defined, this field is blank.	**detail**

show system services dhcp pool

```
user@host> show system services dhcp pool

Pool name    Low address   High address   Excluded addresses
3.3.3.0/24   3.3.3.2       3.3.3.254      3.3.3.1
```

show system services dhcp pool subnet-address

```
user@host> show system services dhcp pool 3.3.3.0/24

Pool information:
    Subnet                      3.3.3.0/24
    Address range               3.3.3.2 - 3.3.3.254
    Addresses assigned          2/253
```

show system services dhcp pool subnet-address detail

```
user@host> show system services dhcp pool 3.3.3.0/24 detail

Pool information:
    Subnet                      3.3.3.0/24
    Address range               3.3.3.2 - 3.3.3.254
    Addresses assigned          2/253
      Active: 1, Excluded: 1

DHCP lease times:
    Default lease time          1 hour
    Minimum lease time          2 hours
    Maximum lease time          infinite

DHCP options:
    Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
    Name: domain-name, Value: mydomain.tld
    Name: router, Value: { 3.3.3.1 }
    Name: server-identifier, Value: 3.3.3.1
    Code: 19, Type: flag, Value: off
    Code: 40, Type: string, Value: domain.tld
    Code: 32, Type: ip-address, Value: 3.3.3.333.3.3.254 3.3.3.1
```

show system services dhcp statistics

Syntax show system services dhcp statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Display Dynamic Host Configuration Protocol (DHCP) server statistics.

Options This command has no options.

List of Sample Output **show system services dhcp statistics on page 525**

Output Fields Table 66 on page 524 describes the output fields for the **show system services dhcp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 66: show system services dhcp statistics Output Fields

Field Name	Field Description
Default lease time	Lease time assigned to clients that do not request a specific lease time.
Minimum lease time	Minimum time a client can retain an IP address lease on the server.
Maximum lease time	Maximum time a client can retain an IP address lease on the server.
Packets dropped	Total number of packets dropped and number of packets dropped because of: • Invalid hardware address • Invalid opcode • Invalid server address • No available address • No interface match • No routing instance match • No valid local addresses • Packet too short • Read error • Send error

Table 66: show system services dhcp statistics Output Fields *(continued)*

Field Name	Field Description
Messages received	Number of the following message types sent from DHCP clients and received by the DHCP server: • BOOTREQUEST • DHCPDECLINE • DHCPDISCOVER • DHCPINFORM • DHCPRELEASE • DHCPREQUEST
Messages sent	Number of the following message types sent from the DHCP server to DHCP clients: • BOOTREPLY • DHCPACK • DHCPOFFER • DHCPNAK

show system services dhcp statistics

```

ssh

Syntax

ssh *host*
<bypass-routing>
<inet | inet6>
<interface *interface-name*>
<logical-system *logical-system-name*>
<routing-instance *routing-instance-name*>
<source *address*>
<v1 | v2>

Syntax (J-EX Series Switch)

ssh *host*
<bypass-routing>
<inet | inet6>
<interface *interface-name*>
<routing-instance *routing-instance-name*>
<source *address*>
<v1 | v2>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the **ssh** command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:

ssh *address* '*cli-command1* ; *cli-command2* '

Options

host—Name or address of the remote system.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

inet | inet6—(Optional) Create an IPv4 or IPv6 connection, respectively.

interface *interface-name*—(Optional) Interface name for the SSH session. (This option does not work when **default-address-selection** is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

logical-system *logical-system-name*—(Optional) Name of a particular logical system for the SSH attempt.

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the SSH attempt.

source *address*—(Optional) Source address of the SSH connection.

v1 | v2—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

Additional Information

To configure an SSH (version 1) key for your user account, include the **authentication ssh-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. For details, see the *Junos OS System Basics Configuration Guide*.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the *Junos OS System Basics Configuration Guide*.

Required Privilege Level

network

List of Sample Output

ssh on page 528

Output Fields

When you enter this command, you are provided feedback on the status of your request.

ssh

```
user@host> ssh cree
Host key not found from the list of known hosts.
Are you sure you want to continue connecting (yes/no)? yes

Host ?cree' added to the list of known hosts.
boojun@cree's password:

% ...
```

telnet

Syntax

telnet *host*
<8bit>
<bypass-routing>
<inet | inet6>
<interface *interface-name*>
<logical-system *logical-system-name*>
<no-resolve>
<port *port-number*>
<routing-instance *routing-instance-name*>
<source *source-address*>

Syntax (J-EX Series Switch)

telnet *host*
<8bit>
<bypass-routing>
<inet | inet6>
<interface *interface-name*>
<no-resolve>
<port *port-number*>
<routing-instance *routing-instance-name*>
<source *source-address*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Open a telnet session to a remote system. Type Ctrl+] to escape from the telnet session to the telnet command level, and then type **quit** to exit from telnet.

Options

host—Name or address of the remote system.

8bit—(Optional) Use an 8-bit data path.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

inet | inet6—(Optional) Open an IPv4 or IPv6 session, respectively.

interface *interface-name*—(Optional) Interface name for the telnet session. (This option does not work when **default-address-selection** is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

logical-system *logical-system-name*—(Optional) Name of a particular logical system for the telnet attempt.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

port *port-number*—(Optional) Port number or service name on the remote system.

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the telnet attempt.

source *source-address*—(Optional) Source address of the telnet connection.

Additional Information You can limit the number of times a user can attempt to enter a password while logging in through telnet. To specify the number of times a user can attempt to enter a password to log in through telnet, include the **retry-options** statement at the [**edit system login**] hierarchy level. For details, see the *Junos OS System Basics Configuration Guide*.

PART 10

Junos OS for J-EX Series Switches System Monitoring

CHAPTER 39

System Monitoring Overview

Understanding Alarm Types and Severity Levels on J-EX Series Switches

Before monitoring alarms on the switch, become familiar with the terms defined in Table 67 on page 533.

Table 67: Alarm Terms

Term	Definition
alarm	Signal alerting you to conditions that might prevent normal operation. On a switch, the alarm signal is the yellow **ALARM** LED lit on the front of the chassis.
alarm condition	Failure event that triggers an alarm.
alarm severity	Seriousness of the alarm. The level of severity can be either major (red) or minor (yellow).
chassis alarm	Predefined alarm triggered by a physical condition on the switch such as a power supply failure, excessive component temperature, or media failure.
system alarm	Predefined alarm triggered by a missing rescue configuration or failure to install a license for a licensed software feature.

Alarm Types

The switch supports these alarms:

- Chassis alarms indicate a failure on the switch or one of its components. Chassis alarms are preset and cannot be modified.
- System alarms indicate a missing rescue configuration. System alarms are preset and cannot be modified, although you can configure them to appear automatically in the J-Web interface display or CLI display.

Alarm Severity Levels

Alarms on a J-EX Series Switches have two severity levels:

- Major (red)—Indicates a critical situation on the switch that has resulted from one of the following conditions. A red alarm condition requires immediate action.
  - One or more hardware components have failed.
  - One or more hardware components have exceeded temperature thresholds.
  - An alarm condition configured on an interface has triggered a critical warning.

  NOTE: When you connect power to a J-EX4200 switch, the Alarm (ALM) LED lights red to indicate that the network link is disconnected. This behavior is normal. Plugging an active Ethernet cable into the management (MGMT) port on the switch completes the network link and turns off the ALM LED.

  Connecting the switch to a dedicated management console instead of a network does not affect the ALM LED. The LED remains red until the switch is connected to a network.

- Minor (yellow or amber)—Indicates a noncritical condition on the switch that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

  A missing rescue configuration generates a yellow system alarm. To set the rescue configuration, see “Setting or Deleting the Rescue Configuration (CLI Procedure)” on page 344.

Related Documentation

- Checking Active Alarms with the J-Web Interface on page 544
- Dashboard for J-EX Series Switches on page 534

Dashboard for J-EX Series Switches

When you log in to the J-Web user interface, the dashboard for the J-EX Series switch appears. Use the dashboard to view system information.

The dashboard comprises four panels and a graphical chassis viewer. You can click **Preferences** to choose which panels are to be displayed and set the refresh interval for chassis viewer information. Click **OK** to save your preference changes and return to the dashboard or click **Cancel** to return to the dashboard without saving changes.

NOTE: You can drag and drop the various panels to different locations in the J-Web window.

This topic describes:

System Information Panel

Table 68: System Information

Field	Description
System name	Indicates the local name of the J-EX Series switch.
Device model	Indicates the model of the J-EX Series switch. NOTE: For a J-EX8208 switch or a J-EX8216 switch, the **Device model** information changes with respect to the selected line card, the Switch Fabric and Routing Engine (SRE) module in a J-EX8208 switch, or the Routing Engine (RE) module in a J-EX8216 switch.
Inventory details	Indicates the following: • For J-EX4200 switches not configured as Virtual Chassis, the value in **Inventory** is always 1 FPC. FPC is a legacy term for a slot in a large router chassis; here, it simply refers to the single switch. • For a J-EX4200 switch configured as a Virtual Chassis, the value in **Inventory** is displayed as 1–10 FPC, with the number corresponding to the number of member switches. • For a J-EX8208 switch, the values in **Inventory** are displayed as 1–3 CB and 0–8 FPC. Control board (CB) refers to SRE and SF modules. FPC refers to line cards. • For a J-EX8216 switch, the values in **Inventory** are displayed as 1-2 CB and 0-16 FPC. Control board (CB) refers to RE modules. FPC refers to line cards.
Junos image	Indicates the version of the Junos OS image.
Boot image	Indicates the version of the boot image that is used.
Device uptime	Indicates the time since the last reboot.
Last configured time	Indicates the time when the switch was last configured.

Health Status Panel

Table 69: Health Status

Field	Description
J-EX4200 Switches	
Memory util.	Indicates the memory used in the Routing Engine. In a Virtual Chassis configuration, the memory utilization value of the master Routing Engine is displayed.
Flash	Indicates the usage and capacity of internal flash memory and any external USB flash drive.

Table 69: Health Status *(continued)*

Field	Description
Temp.	Indicates the chassis temperature status. Temperatures in the dashboard are listed in Celsius and the corresponding Fahrenheit values.
CPU load	Indicates the average CPU usage over 15 minutes.
Fan status	Indicates the fan status of the switch. The possible values are **OK**, **Failed**, and **Absent**.
J-EX8208 Switches	
Memory util.	Indicates the memory used in the Routing Engine. If there are two Routing Engines, the memory utilization value of the master is displayed.
CPU load	Indicates the average CPU usage over 15 minutes.
Flash	Indicates the usage and capacity of internal flash memory and any external USB flash drive.
J-EX8216 Switches	
Memory util.	Indicates the memory used in the Routing Engine. If there are two Routing Engines, the memory utilization value of the master is displayed.
CPU load	Indicates the average CPU usage over 15 minutes.
Flash	Indicates the usage and capacity of internal flash memory and any external USB flash drive.

Capacity Utilization Panel

Table 70: Capacity Utilization

Field	Description
Number of active ports	Indicates the number of active ports in the switch.
Total number of ports	Indicates the number of ports in the switch.
Used-up MAC-Table entries	Indicates the number of MAC-Table entries.
Supported MAC-Table entries	Indicates the maximum number of MAC-Table entries permitted.
Number of VLANs configured	Indicates the number of configured VLANs.
Number of VLANs supported	Indicates the maximum number of VLANs that are supported.

Alarms Panel

Displays information about the last five alarms raised in the system. For example, if there are 5 major alarms, then details for all 5 major alarms are displayed. If there are 4 major alarms and 3 minor alarms, then details of the 4 major alarms and 1 minor alarm are displayed. Major alarms are displayed in red and minor alarms are displayed in yellow.

NOTE: When you connect power to a J-EX4200 switch, the Alarm (ALM) LED lights red to indicate that the network link is disconnected. This behavior is normal. Plugging an active Ethernet cable into the management (MGMT) port on the switch completes the network link and turns off the ALM LED.

Connecting the switch to a dedicated management console instead of a network does not affect the ALM LED. The LED remains red until the switch is connected to a network.

Chassis Viewer

You can click the **Rear View** button to see the back of the chassis image. Click **Front View** to see the front of the image. In a Virtual Chassis configuration, the **Rear View** button is disabled if the switch is not selected.

- Table 71 on page 537—Describes the chassis viewer for J-EX4200 switches.
- Table 72 on page 538—Describes the chassis viewer for J-EX8208 switches.
- Table 73 on page 540—Describes the chassis viewer for J-EX8216 switches.

Table 71: Chassis Viewer for J-EX4200 Switches

Field	Description
Front View	
Interface status	In the image, the colors listed below denote the interface status: • Green—Interface is up and operational. • Yellow—Interface is up but is nonoperational. • Gray—Interface is down and nonoperational. Hover the mouse pointer over the interface (port) to view more information. For a Virtual Chassis configuration, select the switch to view the interface status. If an SFP+ uplink module is installed in the switch, hover the mouse pointer over the port icon to display whether the module is configured to operate in 1G mode or 10G mode. If the module is configured to operate in 1G mode, the tool tip information is displayed for all 4 ports. If the module is configured to operate in 10G mode, the tool tip information is displayed only for 2 ports. For SFP and SFP+ ports, the interfaces appear dimmed if no transceiver is inserted. The chassis viewer displays “Transceiver not plugged-in” when you hover the mouse pointer over the port icon.
LCD panel	LCD panel configured for the LEDs on the ports. Hover the mouse pointer over the icon to view the current character display.
Rear View of the J-EX4200 Switch	
Fan tray	Hover the mouse pointer over the fan tray icon to display Name, Status, and Description information. For a Virtual Chassis, the status of the fans of the selected member switch is displayed.

Table 71: Chassis Viewer for J-EX4200 Switches *(continued)*

Field	Description
Virtual Chassis port	Displayed only when switches are configured as a Virtual Chassis. The colors listed below denote the Virtual Chassis port (VCP) status: • Green—VCP is up and operational. • Yellow—VCP is up but is nonoperational. • Gray—VCP is down and nonoperational.
USB port	Indicates the USB port for the switch. NOTE: We recommend you use USB flash drives purchased from Dell for your J-EX Series switch.
Management (**me0**) port	The management port is used to connect the switch to a management device for out-of-band management.
Console port	The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)
Power supplies	Hover the mouse pointer over the power supply icons to display Name, Status, and Description information.

Table 72: Chassis Viewer for J-EX8208 Switches

Field	Description
Front View	
Interface status	In the image, click any line card, SRE module, or SF module to view the front view of the selected component. The colors listed below denote the interface status: • Green—Interface is up and operational. • Yellow—Interface is up but is nonoperational. • Gray—Interface is down and nonoperational. Hover the mouse pointer over the interface (port) to view more information. You can view status for the following ports on the SRE module: • USB port—Indicates the USB port for the switch. NOTE: We recommend you use USB flash drives purchased from Dell for your J-EX Series switch. • Auxiliary port—This port is not enabled on the switch. It is reserved for future use. • Management (**me0**) port—The management port is used to connect the switch to a management device for out-of-band management. • Console port—The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.) Because the SF module has no ports, no status information is displayed.

Table 72: Chassis Viewer for J-EX8208 Switches *(continued)*

Field	Description
Slot numbers	Slots on the switch are labeled, from the top of the switch down: • 0–3 (line cards) • SRE0, SF, SRE1 (SRE and SF modules) • 4–7 (line cards)
Temperature	The active slots contain a gray temperature icon. Hover the mouse pointer over the icon to display temperature information for the slot.
Fan status	Hover the mouse pointer over the fan tray icon to display Name, Status, and Description information.
Power supplies	Hover the mouse pointer over the power supply icons to display Name, Status, and Description information.
LCD panel	LCD panel configured for the LEDs on the ports. Hover the mouse pointer over the icon to view the current character display.
Rear View	The J-EX8208 switch does not have any components on the rear of the chassis.

Table 73: Chassis Viewer for J-EX8216 Switches

Field	Description
Front View	
Interface status	In the image, click any line card or RE module to view the front view of the selected component. The colors listed below denote the interface status: • Green—Interface is up and operational. • Yellow—Interface is up but is nonoperational. • Gray—Interface is down and nonoperational. Hover the mouse pointer over the interface (port) to view more information. You can view status for the following ports on the RE module: • USB port—Indicates the USB port for the switch. NOTE: We recommend you use USB flash drives purchased from Dell for your J-EX Series switch. • Auxiliary port—This port is not enabled on the switch. It is reserved for future use. • Management (**me0**) port—The management port is used to connect the switch to a management device for out-of-band management. • Console port—The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)
Slot numbers	Slots on the switch are labeled, from the top of the switch down: • RE0 (RE module) • RE1 (RE module) • 0–15 (line cards)
Temperature	The active slots contain a gray temperature icon. Hover the mouse pointer over the icon to display temperature information for the slot.
Fan status	Hover the mouse pointer over the fan tray icon to display consolidated fan information.
Power supplies	Hover the mouse pointer over the power supply icons to display Name, Status, and Description information.
LCD panel	LCD panel configured for the LEDs on the ports. Hover the mouse pointer over the icon to view the current character display.
Rear View	
SF modules	Hover the mouse pointer over the SF module icons in their respective slots to display information. Slots are numbered SF7–SF0, from left to right.

CHAPTER 40

Administering and Monitoring System Functions

Monitoring System Log Messages

Purpose Use the monitoring functionality to filter and view system log messages for J-EX Series switches.

Action To view events in the J-Web interface, select **Monitor > Events and Alarms > View Events**.

Apply a filter or a combination of filters to view messages. You can use filters to display relevant events. Table 74 on page 541 describes the different filters, their functions, and the associated actions.

To view events in the CLI, enter the following command:

show log

Table 74: Filtering System Log Messages

Field	Function	Your Action
System Log File	Specifies the name of a system log file for which you want to display the recorded events. Lists the names of all the system log files that you configure. By default, a log file, **messages**, is included in the **/var/log/** directory.	To specify events recorded in a particular file, select the system log filename from the list—for example, **messages**. Select **Include archived files** to include archived files in the search.

Table 74: Filtering System Log Messages *(continued)*

Field	Function	Your Action
Process	Specifies the name of the process generating the events you want to display. To view all the processes running on your system, enter the CLI command **show system processes**. For more information about processes, see the *Junos OS Installation and Upgrade Guide* at http://www.juniper.net/techpubs/software/junos/.	To specify events generated by a process, type the name of the process. For example, type **mgd** to list all messages generated by the management process.
Date From To	Specifies the time period in which the events you want displayed are generated. Displays a calendar that allows you to select the year, month, day, and time. It also allows you to select the local time. By default, the messages generated in the last hour are displayed. End Time shows the current time and Start Time shows the time one hour before End Time.	To specify the time period: • Click the **Calendar** icon and select the year, month, and date—for example, **02/10/2007**. • Click the **Calendar** icon and select the year, month, and date—for example, **02/10/2007**. • Click to select the time in hours, minutes, and seconds.
Event ID	Specifies the event ID for which you want to display the messages. Allows you to type part of the ID and completes the remainder automatically. An event ID, also known as a system log message code, uniquely identifies a system log message. It begins with a prefix that indicates the generating software process or library.	To specify events with a specific ID, type the partial or complete ID—for example, **TFTPD_AF_ERR**.
Description	Specifies text from the description of events that you want to display. Allows you to use regular expressions to match text from the event description. NOTE: Regular expression matching is case-sensitive.	To specify events with a specific description, type a text string from the description with regular expression. For example, type **^Initial*** to display all messages with lines beginning with the term *Initial*.
Search	Applies the specified filter and displays the matching messages.	To apply the filter and display messages, click **Search**.

Meaning Table 75 on page 543 describes the Event Summary fields.

NOTE: By default, the View Events page in the J-Web interface displays the most recent 25 events, with severity levels highlighted in different colors. After you specify the filters, Event Summary displays the events matching the specified filters. Click the **First**, **Next**, **Prev**, and **Last** links to navigate through messages.

Table 75: Viewing System Log Messages

Field	Function	Additional Information
Process	Displays the name and ID of the process that generated the system log message.	The information displayed in this field is different for messages generated on the local Routing Engine than for messages generated on another Routing Engine (on a system with two Routing Engines installed and operational). Messages from the other Routing Engine also include the identifiers **re0** and **re1** to identify the Routing Engine.
Severity	Severity level of a message is indicated by different colors. • **Unknown**—Gray—Indicates no severity level is specified. • **Debug/Info/Notice**—Green—Indicates conditions that are not errors but are of interest or might warrant special handling. • **Warning**—Yellow—Indicates conditions that warrant monitoring. • **Error**—Blue—Indicates standard error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels. • **Critical**—Pink—Indicates critical conditions, such as hard-drive errors. • **Alert**—Orange—Indicates conditions that require immediate correction, such as a corrupted system database. • **Emergency**—Red—Indicates system panic or other conditions that cause the switch to stop functioning.	A severity level indicates how seriously the triggering event affects switch functions. When you configure a location for logging a facility, you also specify a severity level for the facility. Only messages from the facility that are rated at that level or higher are logged to the specified file.
Event ID	Displays a code that uniquely identifies the message. The prefix on each code identifies the message source, and the rest of the code indicates the specific event or error.	The event ID begins with a prefix that indicates the generating software process. Some processes on a switch do not use codes. This field might be blank in a message generated from such a process. An event can belong to one of the following type categories: • **Error**—Indicates an error or failure condition that might require corrective action. • **Event**—Indicates a condition or occurrence that does not generally require corrective action.
Event Description	Displays a more detailed explanation of the message.	
Time	Displays the time at which the message was logged.

Checking Active Alarms with the J-Web Interface

Purpose Use the monitoring functionality to view alarm information for the J-EX Series switches including alarm type, alarm severity, and a brief description for each active alarm on the switching platform.

Action To view the active alarms:

1. Select **Monitor> Events and Alarms > View Alarms** in the J-Web interface.
2. Select an alarm filter based on alarm type, severity, description, and date range.
3. Click **Go**.

   All the alarms matching the filter are displayed.

NOTE: When the switch is reset, the active alarms are displayed.

Meaning Table 76 on page 544 lists the alarm output fields.

Table 76: Summary of Key Alarm Output Fields

Field	Values
Type	Category of the alarm: • Chassis—Indicates an alarm condition on the chassis (typically an environmental alarm such as one related to temperature). NOTE: When you connect power to a J-EX4200 switch, the Alarm (ALM) LED lights red to indicate that the network link is disconnected. This behavior is normal. Plugging an active Ethernet cable into the management (MGMT) port on the switch completes the network link and turns off the ALM LED. Connecting the switch to a dedicated management console instead of a network does not affect the ALM LED. The LED remains red until the switch is connected to a network. • System—Indicates an alarm condition in the system.
Severity	Alarm severity—either major (red) or minor (yellow).
Description	Brief synopsis of the alarm.
Time	Date and time when the failure was detected.

Monitoring Chassis Alarms for a J-EX8200 Switch

Purpose This document provides information on chassis alarm conditions, and how you should respond when a certain chassis alarm is seen on your switch.

Various conditions related to the chassis components trigger yellow and red alarms. You cannot configure these conditions. See “Understanding Alarm Types and Severity Levels on J-EX Series Switches” on page 533.

Action You can monitor chassis alarms by watching the ALM chassis status LED and using the LCD panel to gather information about the alarm. See Chassis Status LEDs in a J-EX8200 Switch and LCD Panel in a J-EX8200 Switch.

To display switch chassis alarms in the CLI, use the following command

```
user@host> show chassis alarms
```

The command output displays the number of alarms currently active, the time when the alarm began, the severity level, and an alarm description. Note the date and time of an alarm so that you can correlate it with error messages in the messages system log file.

You can also monitor chassis alarms using the J-Web interface. See “Checking Active Alarms with the J-Web Interface” on page 544.

Table 77 on page 545 lists some of the chassis alarms that a J-EX8200 switch can generate.

Table 77: Chassis Alarms for J-EX8200 Switches

Component	Alarm Condition	Remedy	Severity	Additional Information
Fan tray	The fan tray has been removed from the chassis.	Install the fan tray.	Yellow/Red	The switch will eventually get too hot to operate if a fan tray is removed. Temperature alarms will follow. This alarm is expected during fan tray removal and installation.
Fan tray	One or more fans in a fan tray is spinning below the required speed.	Replace the fan tray.	Red	Individual fans cannot be replaced; you must replace the fan tray.
Fan tray	The fan tray’s internal connection to the switch is not functioning properly.	Remove and reinsert the fan tray. If removing and reinserting the fan tray does not resolve the problem, reboot the switch.	Red	The switch will eventually get too hot to operate if a fan tray is not operating. Temperature alarms will follow.

Table 77: Chassis Alarms for J-EX8200 Switches *(continued)*

Power supply	A power supply slot that contained a power supply at bootup is now empty.	Install a power supply in the empty power supply slot.	Yellow	You can ignore this alarm in cases in which a power supply slot can remain empty. You will not see this alarm if the switch is booted with an empty power supply slot. This alarm is expected during power supply removal and installation. This alarm can be triggered by a line card insertion. The alarm condition corrects itself when seen for this reason.
Power supply	A power supply has failed due to an input or output failure, or due to temperature issues.	Replace the failed power supply.	Red	
Power supply	A power supply's internal connection to the switch is not operating properly.	Remove and reinsert the power supply. If removing and reinserting the power supply does not resolve the problem, reboot the switch.	Red	
Temperature	The chassis warm temperature threshold has been exceeded and fan speeds have increased.	Adjust room temperature downward, if possible. Ensure airflow through the switch is unobstructed.	Yellow	The chassis is warm and should be cooled down. The switch is still functioning normally. To monitor temperature: user@switch> **show chassis environment** To monitor temperature thresholds: user@switch> **show chassis temperature-thresholds**

Table 77: Chassis Alarms for J-EX8200 Switches *(continued)*

Temperature	The chassis high temperature threshold has been exceeded and the fans are operating at full speed.	Adjust room temperature downward, if possible. Ensure airflow through the switch is unobstructed.	Red	The chassis is hot and should be cooled down. The switch might still function normally but is close to shutting down if it hasn't already. To monitor temperature: user@switch> **show chassis environment** To monitor temperature thresholds: user@switch> **show chassis temperature-thresholds**
Temperature	The chassis warm temperature threshold has been exceeded, and one or more fans are not operating properly. The operating fans are running at full speed.	Replace the fan tray that has the faulty fan or fans. Adjust room temperature downward, if possible. Ensure airflow through the switch is unobstructed.	Yellow	The chassis is warm and should be cooled down. The switch is still functioning normally. To monitor temperature: user@switch> **show chassis environment** To monitor temperature thresholds: user@switch> **show chassis temperature-thresholds**
Temperature	The chassis high temperature threshold has been exceeded, and one or more fans is not operating properly. The operating fans are running at full speed.	Replace the fan tray that has the faulty fan or fans. Adjust room temperature downward, if possible. Ensure airflow through the switch is unobstructed.	Red	The chassis is hot and should be cooled down. The switch might still function normally but is close to shutting down if it hasn't already. To monitor temperature: user@switch> **show chassis environment** To monitor temperature thresholds: user@switch> **show chassis temperature-thresholds**
Temperature	The temperature sensor on a hardware component has failed.	Replace the hardware component.	Yellow	
Routing Engine (RE), Switch Fabric and Routing Engine (SRE), or Switch Fabric (SF) module	The RE, SRE, or SF module has failed.	The RE, SRE, or SF module must be replaced.	Red	

Table 77: Chassis Alarms for J-EX8200 Switches *(continued)*

Link Status	The link to the network is down.	Check network connectivity.	Red or Yellow	The network link is disabled by default, so you might see this alarm before you connect the switch to the network.

Monitoring Switch Control Traffic

Purpose Use the packet capture feature when you need to quickly capture and analyze switch control traffic on a switch. The packet capture feature allows you to capture traffic destined for or originating from the Routing Engine.

Action To use the packet capture feature in the J-Web interface, select **Troubleshoot>Packet Capture**.

To use the packet capture feature in the CLI, enter the following CLI command:

monitor traffic

Meaning You can use the packet capture feature to compose expressions with various matching criteria to specify the packets that you want to capture. You can decode and view the captured packets in the J-Web interface as they are captured. The packet capture feature does not capture transient traffic.

Table 78: Packet Capture Field Summary

Field	Function	Your Action
Interface	Specifies the interface on which the packets are captured. If you select default, packets on the Ethernet management port 0, are captured.	From the list, select an interface—for example, **ge-0/0/0**.
Detail level	Specifies the extent of details to be displayed for the packet headers. • Brief—Displays the minimum packet header information. This is the default. • Detail—Displays packet header information in moderate detail. • Extensive—Displays the maximum packet header information.	From the list, select **Detail**.
Packets	Specifies the number of packets to be captured. Values range from **1** to **1000**. Default is **10**. Packet capture stops capturing packets after this number is reached.	From the list, select the number of packets to be captured—for example, 10.

Table 78: Packet Capture Field Summary *(continued)*

Field	Function	Your Action
Addresses	Specifies the addresses to be matched for capturing the packets using a combination of the following parameters: • Direction—Matches the packet headers for IP address, hostname, or network address of the source, destination or both. • Type—Specifies if packet headers are matched for host address or network address. You can add multiple entries to refine the match criteria for addresses.	Select address-matching criteria. For example: 1. From the Direction list, select **source**. 2. From the Type list, select **host**. 3. In the Address box, type **10.1.40.48**. 4. Click **Add**.
Protocols	Matches the protocol for which packets are captured. You can choose to capture TCP, UDP, or ICMP packets or a combination of TCP, UDP, and ICMP packets.	From the list, select a protocol—for example, tcp.
Ports	Matches packet headers containing the specified source or destination TCP or UDP port number or port name.	Select a direction and a port. For example: • From the Type list, select **src**. • In the Port box, type **23**.
Advanced Options		
Absolute TCP Sequence	Specifies that absolute TCP sequence numbers are to be displayed for the packet headers.	To display absolute TCP sequence numbers in the packet headers, select this check box.
Layer 2 Headers	Specifies that link-layer packet headers are to be displayed.	To include link-layer packet headers while capturing packets, select this check box.
Non-Promiscuous	Specifies not to place the interface in promiscuous mode, so that the interface reads only packets addressed to it. In promiscuous mode, the interface reads every packet that reaches it.	To read all packets that reach the interface, select this check box.
Display Hex	Specifies that packet headers, except link-layer headers, are to be displayed in hexadecimal format.	To display the packet headers in hexadecimal format, select this check box.
Display ASCII and Hex	Specifies that packet headers are to be displayed in hexadecimal and ASCII format.	To display the packet headers in ASCII and hexadecimal formats, select this check box.
Header Expression	Specifies the match condition for the packets to be captured. The match conditions you specify for Addresses, Protocols, and Ports are displayed in expression format in this field.	You can enter match conditions directly in this field in expression format or modify the expression composed from the match conditions you specified for Addresses, Protocols, and Ports. If you change the match conditions specified for Addresses, Protocols, and Ports again, packet capture overwrites your changes with the new match conditions.
Packet Size	Specifies the number of bytes to be displayed for each packet. If a packet header exceeds this size, the display is truncated for the packet header. The default value is 96 bytes.	Type the number of bytes you want to capture for each packet header—for example, **256**.

Table 78: Packet Capture Field Summary *(continued)*

Field	Function	Your Action
Don't Resolve Addresses	Specifies that IP addresses are not to be resolved into hostnames in the packet headers displayed.	To prevent packet capture from resolving IP addresses to hostnames, select this check box.
No Timestamp	Suppresses the display of packet header timestamps.	To stop displaying timestamps in the captured packet headers, select this check box.
Write Packet Capture File	Writes the captured packets to a file in PCAP format in /var/tmp. The files are named with the prefix jweb-pcap and the extension .pcap. If you select this option, the decoded packet headers are not displayed on the packet capture page.	To decode and display the packet headers on the J-Web page, clear this check box.

Monitoring System Properties

Purpose Use the monitoring functionality to view system properties such as the name and IP address of the switch and resource usage.

Action To monitor system properties in the J-Web interface, select **Monitor > System View > System Information**.

To monitor system properties in the CLI, enter the following commands:

- **show system uptime**
- **show system users**
- **show system storage**

Meaning Table 79 on page 550 summarizes key output fields in the system properties display.

Table 79: Summary of Key System Properties Output Fields

Field	Values	Additional Information
General Information		
Serial Number	Serial number for the switch.	
Junos OS Version	Version of Junos OS active on the switch, including whether the software is for domestic or export use.	Export software is for use outside of the U.S. and Canada.
Hostname	The name of switch.	
IP Address	The IP address of the switch.	

Table 79: Summary of Key System Properties Output Fields *(continued)*

Field	Values	Additional Information
Loopback Address	The loopback address.	
Domain Name Server	The address of the domain name server.	
Time Zone	The time zone on the switch.	
Time		
Current Time	Current system time, in Coordinated Universal Time (UTC).	
System Booted Time	Date and time when the switch was last booted and how long it has been running.	
Protocol Started Time	Date and time when the switching protocols were last started and how long they have been running.	
Last Configured Time	Date and time when a configuration was last committed. This field also shows the name of the user who issued the last **commit** command, through either the J-Web interface or the CLI.	
Load Average	The CPU load average for 1, 5, and 15 minutes.	
Storage Media		
Internal Flash Memory	Memory usage details of internal flash.	
External Flash Memory	Usage details of external flash memory.	
Logged in Users Details		
User	Username of any user logged in to the switching platform.	
Terminal	Terminal through which the user is logged in.	
From	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.	
Login Time	Time when the user logged in.	This is the **LOGIN@** field in **show system users** command output.

Table 79: Summary of Key System Properties Output Fields *(continued)*

Field	Values	Additional Information
Idle Time	How long the user has been idle.

Monitoring Chassis Information

Purpose Use the monitoring functionality to view chassis properties such as general switch information, temperature and fan status, and resource information for the J-EX Series switch.

Action To view chassis properties in the J-Web interface, select **Monitor > System View > Chassis Information**.

To view chassis properties in the CLI, enter the following commands:

- **show chassis environment**
- **show chassis fpc**
- **show chassis hardware**

Meaning Table 80 on page 552 gives information about the key output fields for chassis information.

NOTE: For a J-EX4200 standalone switch, FPC refers to the switch itself. In a Virtual Chassis configuration, FPC refers to the member switch. In a J-EX8200 switch, FPC refers to the line card.

Table 80: Summary of the Key Output Fields for Chassis Information

Field	Values
Routing Engine Details	Select the **Master** tab to view details about the master Routing Engine or select **Backup** to view details about the backup Routing Engine.

Table 80: Summary of the Key Output Fields for Chassis Information *(continued)*

Field	Values
Name/Value	This table displays the following details of the master Routing Engine: • Routing engine module • Model • Version • Part number • Serial number • Memory utilization • Temperature • Start time • CPU load average for 1, 5, and 15 minutes
Power and Fan Tray Details	
Power	Select the **Power** tab to view details of the power supplies.
Name/Value	Displays the status and model number of each power supply.
Fan	Select the **Fan** tab to view details about the fans.
Name/Value	Displays the status of each fan in the corresponding FPC.
Chassis Component Details	
Select component	Select an FPC to view **General**, **Temperature**, **Resource**, and **Sub-component** details.
General	Select the **General** tab to view the general information about the chassis components.
Name/Value	Displays general information: • Version—Revision level. Supply the version number when reporting hardware problems to customer support. • Part Number • Serial Number—Supply the serial number when contacting customer support about the switch chassis. • Description—Brief text description.
Temperature	Select the **Temperature** tab to view the temperature details of the components in the selected FPC.
Name/Value	Displays the temperature details of the sensors present in the selected FPC.
Resource	Select the **Resource** tab to view the resource details of the selected FPC.

Table 80: Summary of the Key Output Fields for Chassis Information *(continued)*

Field	Values

Name/Value	Displays resource details:
	• State:
	  • **Dead**—Held in reset because of errors.
	  • **Diag**—The FPC is running diagnostics.
	  • **Dormant**—Held in reset.
	  • **Empty**—No FPC is present.
	  • **Online**—The FPC is online and running.
	  • **Probed**—Probe is complete. The FPC is awaiting restart of the Packet Forwarding Engine (PFE).
	  • **Probe-wait**—The FPC is waiting for the probe operation to start.
	• **Total CPU DRAM**—Total DRAM, in megabytes, available to the FPC.
	• **Start time**—Date and time the switch was last rebooted.

Related Documentation

- Monitoring System Properties on page 550
- Dashboard for J-EX Series Switches on page 534

Monitoring System Process Information

Purpose Use the monitoring functionality to view the processes running on the switch.

Action To view the software processes running on the switch in the J-Web interface, select **Monitor>System View>Process Details**.

To view the software processes running on the switch in the CLI, enter the following command.

show system processes

Meaning Table 81 on page 555 summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization.

Table 81: Summary of System Process Information Output Fields

Field	Values
PID	Identifier of the process.
Name	Owner of the process.
State	Current state of the process.
CPU Load	Percentage of the CPU that is being used by the process.
Memory Utilization	Amount of memory that is being used by the process.
Start Time	Time of day when the process started.

Managing Log, Temporary, and Crash Files on the Switch (J-Web Procedure)

You can use the J-Web interface to rotate log files and delete unnecessary log, temporary, and crash files on the switching platform.

1. Cleaning Up Files on page 555
2. Downloading Files on page 556
3. Deleting Files on page 556

Cleaning Up Files

If you are running low on storage space, use the file cleanup procedure to quickly identify files to delete.

The file cleanup procedure performs the following tasks:

- Rotates log files—Archives the current log files, and creates fresh log files.
- Deletes log files in /var/log—Deletes files that are not currently being written to.
- Deletes temporary files in /var/tmp—Deletes files that have not been accessed within two days.
- Deletes all crash files in /var/crash—Deletes core files that the switch has written during an error.

To rotate log files and delete unnecessary files with the J-Web interface:

1. Select **Maintain>Files**.

2. In the Clean Up Files section, click **Clean Up Files**. The switching platform rotates log files and identifies files that can be safely deleted.

   The J-Web interface displays the files that you can delete and the amount of space that will be freed on the file system.

3. Click one:

   - To delete the files and return to the Files page, click **OK**.
   - To cancel your entries and return to the list of files in the directory, click **Cancel**.

Downloading Files

You can use the J-Web interface to download a copy of an individual log, temporary, or crash file from the switching platform. When you download a file, it is not deleted from the file system.

To download files with the J-Web interface:

1. In the J-Web interface, select **Maintain>Files**.
2. In the Download and Delete Files section, click one:

   - Log Files—Log files in the /var/log directory on the switch.
   - Temporary Files—Lists the temporary files in the /var/tmp directory on the switching platform.
   - Jailed Temporary Files (Install, Session, etc)—Lists the files in the /var/jail/tmp directory on the switching platform.
   - Crash (Core) Files—Lists the core files in the /var/crash directory on the switching platform.

     The J-Web interface displays the files located in the directory.

3. Select the files that you want to download and click **Download**.
4. Choose a location for the saved file.

   The file is saved as a text file, with a **.txt** file extension.

Deleting Files

You can use the J-Web interface to delete an individual log, temporary, and crash file from the switching platform. When you delete the file, it is permanently removed from the file system.

CAUTION: If you are unsure whether to delete a file from the switching platform, we recommend using the Clean Up Files tool described in Cleaning Up Files. This tool determines which files can be safely deleted from the file system.

To delete files with the J-Web interface:

1. Select **Maintain>Files**.
2. In the Download and Delete Files section, click one:
   - Log Files—Lists the log files in the /var/log directory on the switching platform.
   - Temporary Files—Lists the temporary files in the /var/tmp directory on the switching platform.
   - Jailed Temporary Files (Install, Session, etc)—Lists the files in the /var/jail/tmp directory on the switching platform.
   - Crash (Core) Files—Lists the core files in the /var/crash directory on the switching platform.

     The J-Web interface displays the files in the directory.
3. Select the box next to each file you plan to delete.
4. Click **Delete**.

   The J-Web interface displays the files you can delete and the amount of space that will be freed on the file system.
5. Click one of the following buttons on the confirmation page:
   - To delete the files and return to the Files page, click **OK**.
   - To cancel your entries and return to the list of files in the directory, click **Cancel**.

CHAPTER 41

Configuration Statements for System Monitoring

archive (All System Log Files)

Syntax archive <files *number*> <size *size* <world-readable | no-world-readable>;

Hierarchy Level [edit system **syslog**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure archiving properties for all system log files.

Options

files ***number***—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it to ***logfile*.0.gz** (the amount of data is determined by the **size** statement at this hierarchy level). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Range: 1 through 1000

Default: 10 files

size ***size***—Maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***.

Syntax: ***x*k** to specify the number of kilobytes, ***x*m** for the number of megabytes, or ***x*g** for the number of gigabytes

Range: 64 KB through 1 GB

world-readable | no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

Default: **no-world-readable**

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Specifying Log File Size, Number, and Archiving Properties

archive-sites

Syntax

```
archive-sites {
  url <password password>;
}
```

Hierarchy Level [edit **event-options destinations** *destination-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify an archive site to which files are transferred. If you specify more than one archive site, the router or switch attempts to transfer to the first archive site in the list, moving to the next site only if the transfer fails.

Options

url—The archive destination specified as Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification. URLs of the type **file://** are not supported; however, local router or switch directories are supported (for example, **/var/tmp/**).

password *password*—A plain-text password for login into the archive site.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Defining Destinations for File Archiving by Event Policies

arguments

Syntax

```
arguments {
  argument-name argument-value;
}
```

Hierarchy Level [edit **event-options policy** *policy-name* **then event-script** *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define command-line arguments for an event script that is invoked from an event policy.

Options

argument-name—Name of the argument.

argument-value—Value of the argument.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Executing Event Scripts in an Event Policy

attributes-match

Syntax

```
attributes-match {
  event1.attribute-name equals event2.attribute-name;
  event.attribute-name matches regular-expression;
  event1.attribute-name starts-with event2.attribute-name;
}
```

Hierarchy Level [edit **event-options policy** *policy-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Execute the policy only if the attributes of two events are correlated or if the attribute of one event matches a regular expression.

If the **attributes-match** statement includes the **equals** or **starts-with** options, or if it includes a **matches** option that includes a clause for an event that is not specified at the **[edit event-options policy *policy-name* events]** hierarchy level, you must include one or more **within** statements in the same policy configuration.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Using Correlated Events to Trigger an Event Policy
- **within on page 608**

commands

Syntax

```
commands {
  "command";
}
```

Hierarchy Level [edit **event-options policy** *policy-name* **then execute-commands**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify an operational mode command to be issued on receipt of an event.

Options ***command***—Command to be issued. Enclose each command in quotation marks (“ ”). The event process (eventd) issues the commands in the order in which they appear in the configuration.

You can include variables in commands. The eventd process replaces each variable with values contained in the event that triggers the policy. You can use command variables of the following forms:

- **{$$.*attribute-name*}**—The double dollar sign (**$$**) notation represents the event that is triggering a policy. When combined with an attribute name, the command variable is replaced by the value of the attribute name of the triggering event.
- **{$*event*.*attribute-name*}**—The dollar sign with the event name (**$*event***) notation represents the most recent event that matches the specified event. The variable is replaced by the value of the attribute name of the most recent event that matches ***event***.
- **{$*.*attribute-name*}**—The dollar sign with the asterisk (**$***) notation represents the most recent event that matches any of the correlating events. The variable is replaced by the value of the attribute name of the most recent event that matches any of the events specified in the policy configuration.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Configuring an Event Policy to Execute Operational Mode Commands
- Representing the Correlating Event in an Event Policy

console (System Logging)

Syntax

```
console {
  facility severity;
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the logging of system messages to the system console.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Junos OS System Logging Facilities and Message Severity Levels.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities the specified level and higher are logged. For a list of the severities, see Junos OS System Logging Facilities and Message Severity Levels.

Required Privilege Level
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Directing System Log Messages to the Console
- *Junos OS System Log Messages Reference*

destination

Syntax

```
destination destination-name {
    retry-count count retry-interval seconds;
    transfer-delay seconds;
}
```

Hierarchy Level [edit **event-options policy** *policy-name* **then event-script** *filename*],
[edit **event-options policy** *policy-name* **then execute-commands**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Assign a location to which to upload command or script output for the specified policy.

Options ***destination-name***—Name of a destination defined in the **destinations** statement at the **[edit event-options]** hierarchy level.

The remaining statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Configuring an Event Policy to Execute Operational Mode Commands
- Executing Event Scripts in an Event Policy
- **destinations on page 566**

destinations

Syntax

```
destinations {
  destination-name {
    archive-sites {
      url <password password>;
    }
    transfer-delay seconds;
  }
}
```

Hierarchy Level [edit event-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define one or more destinations, each with a unique name and other attributes. You can use the destination as a storage location for command output and for various files, such as system log files and core files.

Options ***destination-name***—Name of a destination.

The remaining statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Defining Destinations for File Archiving by Event Policies

equals

Syntax *event1.attribute-name* equals *event2.attribute-name*;

Hierarchy Level [edit event-options policy *policy-name* attributes-match]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Execute the policy only if the specified attribute of ***event1*** equals the specified attribute of ***event2***.

Options ***event1.attribute-name***—Attribute of one event.

event2.attribute-name—Attribute of another event.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

event-options

Syntax

```
event-options {
  destinations {
    destination-name {
      archive-sites {
        url <password password>;
      }
      transfer-delay seconds;
    }
  }
  event-script {
    file filename {
      checksum (md5 | sha-256 | sha1) hash;
      refresh;
      refresh-from url;
      remote-execution {
        remote-hostname {
          passphrase user-password;
          username user-login;
        }
      }
      source url;
    }
    refresh;
    refresh-from url;
    traceoptions {
      file <filename> <files number> <size size> <world-readable | no-world-readable>;
      flag flag;
      no-remote-trace;
    }
  }
  generate-event event-name {
    time-interval seconds;
    time-of-day hh:mm:ss;
  }
  policy policy-name {
    attributes-match {
      event1.attribute-name equals event2.attribute-name;
      event.attribute-name matches regular-expression;
      event1.attribute-name starts-with event2.attribute-name;
    }
    events [ events ];
    within seconds not events [ events ];
    then {

          output-format (text | xml);
          user-name username;
        }
        ignore;
        raise-trap;
        upload filename (filename | committed) destination destination-name {
          retry-count count retry-interval seconds;
          transfer-delay seconds;
          user-name username;
        }
      }
    }
    traceoptions {
      file filename <files number> <size size> <world-readable | no-world-readable>;
      flag flag;
    }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure event policies.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

events (Associating Events with a Policy)

Syntax events [*events*];

Hierarchy Level [edit **event-options policy** *policy-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a list of events that trigger this policy. If one or more of the listed events occurs, the policy is executed.

Options **[*events*]**—List of events. Events can be internally generated, or they can be generated by Junos OS processes.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Using Correlated Events to Trigger an Event Policy

events (Correlating Events with Each Other)

Syntax events [*events*];

Hierarchy Level [edit **event-options policy** *policy-name* **within** *seconds*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a list of events that must occur within a specified time interval for the policy to be triggered.

Options **[*events*]**—List of events. Events can be internally generated, or they can be generated by Junos OS processes.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Using Correlated Events to Trigger an Event Policy

event-script

Syntax

```
event-script {
  file filename {
    checksum (md5 | sha-256 | sha1) hash;
    refresh;
    refresh-from url;
    remote-execution {
      remote-hostname {
        passphrase user-password;
        username user-login;
      }
    }
    source url;
  }
  refresh;
  refresh-from url;
  traceoptions {
    file <filename> <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}
```

Hierarchy Level [edit event-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Junos OS event scripts, configure scripting mechanisms.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Implementing Event Scripts

event-script

Syntax

```
event-script filename {
  arguments {
    argument-name argument-value;
  }
  destination destination-name {
    retry-count count retry-interval seconds;
    transfer-delay seconds;
  }
  output-filename filename;
  output-format (text | xml);
  user-name username;
}
```

Hierarchy Level [edit **event-options policy** *policy-name* **then**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description On receipt of an event, specify operational mode commands to be issued, the format of the command output, and a name and destination for the output file.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Executing Event Scripts in an Event Policy

execute-commands

Syntax

```
execute-commands {
  commands {
    "command";
  }
  destination destination-name {
    retry-count count retry-interval seconds;
    transfer-delay seconds;
  }
  output-filename filename;
  output-format (text | xml);
  user-name username;
}
```

Hierarchy Level [edit **event-options policy** *policy-name* **then**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description On receipt of an event, specify operational mode commands to be issued, the format of the command output, and a name and destination for the output file.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Configuring an Event Policy to Execute Operational Mode Commands

explicit-priority

Syntax

```
explicit-priority;
```

Hierarchy Level [edit system syslog **file** *filename*],
[edit system syslog **host**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Record the priority (facility and severity level) in each standard-format system log message directed to a file or remote destination.

When the **structured-data** statement is also included at the **[edit system syslog file *filename*]** hierarchy level, this statement is ignored for the file.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Including Priority Information in System Log Messages
- *Junos OS System Log Messages Reference*
- **structured-data on page 590**

facility-override

Syntax facility-override *facility*;

Hierarchy Level [edit system syslog **host**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Substitute an alternate facility for the default facilities used when messages are directed to a remote destination.

Options ***facility***—Alternate facility to substitute for the default facilities. For a list of the possible facilities, see Junos OS System Log Alternate Facilities for Remote Logging.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Changing the Alternative Facility Name for Remote System Log Messages
- *Junos OS System Log Messages Reference*

file

Syntax

```
file filename {
  checksum (md5 | sha-256 | sha1) hash;
  refresh;
  refresh-from url;
  remote-execution {
    remote-hostname {
      passphrase user-password;
      username user-login;
    }
  }
  source url;
}
```

Hierarchy Level [edit event-options event-script]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Junos OS event scripts, enable an event script that is located in the **/var/db/scripts/event** directory.

Options ***filename***—The name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing an event script.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Enabling an Event Script

file (System Logging)

Syntax

```
file filename {
  facility severity;
  archive {
    files number;
    size size;
    (no-world-readable | world-readable);
  }
  explicit-priority;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the logging of system messages to a file.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Junos OS System Logging Facilities and Message Severity Levels.

file *filename*—File in the /var/log directory in which to log messages from the specified facility. To log messages to more than one file, include more than one **file** statement.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities the specified level and higher are logged. For a list of the severities, see Junos OS System Logging Facilities and Message Severity Levels.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Directing System Log Messages to a Log File
- *Junos OS System Log Messages Reference*

files

Syntax files *number*;

Hierarchy Level [edit system syslog **archive**],
[edit system syslog file *filename* archive]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it to ***logfile*.0.gz** (for information about the maximum file size, see **size**). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Options ***number***—Maximum number of archived files.

Range: 1 through 1000

Default: 10 files

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- **size on page 588**

generate-event

Syntax

```
generate-event event-name {
    time-interval seconds;
    time-of-day hh:mm:ss;
}
```

Hierarchy Level [edit event-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Generate an internal event, based on a time interval or the time of day.

Options ***event-name***—Name of an internally generated event.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Generating Internal Events to Trigger Event Policies

host

Syntax

```
host (hostname | other-routing-engine) {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
}
```

J-EX Series Switches

```
host (hostname | other-routing-engine | scc-master) {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
}
```

TX Matrix Plus Router

```
host (hostname | other-routing-engine | sfc0-master) {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
}
```

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the logging of system messages to a remote destination.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Junos OS System Logging Facilities and Message Severity Levels.

hostname—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.

other-routing-engine—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities the specified level and higher are logged. For a list of the severities, see Junos OS System Logging Facilities and Message Severity Levels.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- *Junos OS System Log Messages Reference*

ignore

Syntax
```
ignore;
```

Hierarchy Level
[edit **event-options policy** *policy-name* **then**]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Define a policy that ignores particular events. If one or more of the listed events occur, a system log message for the event is not generated, and no further policies associated with this event are processed. If you include the **ignore** statement in a policy configuration, you cannot configure any other actions in the policy.

Required Privilege Level
maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Configuring Event Policies to Ignore an Event

interface (Accounting or Sampling)

Syntax
```
interface interface-name {
    engine-id number;
    engine-type number;
    source-address address;
}
```

Hierarchy Level
[edit forwarding-options accounting *name* output],
[edit forwarding-optionssamplingoutput]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Specify the output interface for monitored traffic.

Options
interface-name—Name of the interface.

The remaining statements are explained separately.

Usage Guidelines
See Configuring Discard Accounting or Configuring Traffic Sampling.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

log-prefix

Syntax log-prefix *string*;

Hierarchy Level [edit system syslog **host**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Include a text string in each message directed to a remote destination.

Options ***string***—Text string to include in each message.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Adding a Text String to System Log Messages
- *Junos OS System Log Messages Reference*

match

Syntax match "*regular-expression*";

Hierarchy Level [edit system syslog **file** *filename*],
[edit system syslog **host** *hostname* | other-routing-engine| scc-master)],
[edit system syslog **user** (*username* | *)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify a text string that must (or must not) appear in a message for the message to be logged to a destination.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation
- Using Regular Expressions to Refine the Set of Logged Messages

not

Syntax not events [*events*];

Hierarchy Level [edit **event-options policy** *policy-name* **within** *seconds*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a list of events that must not occur within the specified time interval for the policy to be triggered.

Options **[*events*]**—List of events. Events can be internally generated, or they can be generated by Junos OS processes.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Using Correlated Events to Trigger an Event Policy

output-filename

Syntax output-filename *filename*;

Hierarchy Level [edit **event-options policy** *policy-name* **then event-script** *filename*],
[edit **event-options policy** *policy-name* **then execute-commands**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Assign a filename to which to write command or script output for the specified commands or script. For op scripts, this statement is optional.

Options ***filename***—Name of a file in which to write command or script output.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Configuring an Event Policy to Execute Operational Mode Commands
- Executing Event Scripts in an Event Policy

output-format

Syntax output-format (text | xml);

Hierarchy Level [edit **event-options policy** *policy-name* **then event-script** *filename*],
[edit **event-options policy** *policy-name* **then execute-commands**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the format (ASCII text or XML) for the output of the specified commands or script.

Options **text**—Formatted ASCII text.

xml—Junos Extensible Markup Language (XML) tags.

Default: **xml** at the **[edit event-options policy *policy-name* then execute-commands]** hierarchy level and **text** at the **[edit event-options policy *policy-name* then event-script *filename*]** hierarchy level.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Configuring an Event Policy to Execute Operational Mode Commands

policy

Syntax

```
policy policy-name {
  attributes-match {
    event1.attribute-name equals event2.attribute-name;
    event.attribute-name matches regular-expression;
    event1.attribute-name starts-with event2.attribute-name;
  }
  events [ events ];
  then {
    ... the then subhierarchy appears at the end of the [edit event-options policy policy-name]
      hierarchy level ...
  }
  within seconds {
    events [ events ];
    not events [ events ];
    trigger (on | after | until) event-count;
  }

  then {
    event-script filename {
      arguments {
        argument-name argument-value;
      }
      destination destination-name {
        retry-count count retry-interval seconds;
        transfer-delay seconds;
      }
      output-filename filename;
      output-format (text | xml);
      user-name username;
    }
    execute-commands {
      commands {
        "command";
      }
      destination destination-name {
        retry-count count retry-interval seconds;
        transfer-delay seconds;
      }
      output-filename filename;
      output-format (text | xml);
      user-name username;
    }
    ignore;
    raise-trap;
    upload filename (filename | committed) destination destination-name {
      retry-count count retry-interval seconds;
      transfer-delay seconds;
      user-name username;
    }
  }
}
```

Hierarchy Level [edit **event-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define an event policy to be processed by the eventd process. If you configure a policy, the **events** and **then** statements are mandatory.

You can configure multiple policies to be processed for an event. The policies are executed in the order in which they appear in the configuration. If you configure more than one policy for an event, and if one of the policies is to ignore the event, no policies that follow the **ignore** statement are executed.

Default If you do not configure a policy for an event, the event is recorded in the system log.

Options ***policy-name***—Name of an event policy.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

raise-trap

Syntax raise-trap;

Hierarchy Level [edit **event-options policy** *policy-name* **then**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define a policy that raises an SNMP trap in response to an event. If one or more of the listed events occur, the system log message for the event is converted into a trap. This enables an agent to notify a trap-based network management system (NMS) of significant events.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Configuring Event Policies to Raise SNMP Traps

refresh

Syntax refresh;

Hierarchy Level [edit **event-options event-script**],
[edit **event-options event-script file** *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Junos OS event scripts, overwrite the local copy of all enabled event scripts or a single enabled script located in the **/var/db/scripts/event** directory with the copy located at the source URL, specified in the **source** statement at the same hierarchy level.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Updating an Event Script from the Master Source
- **refresh-from on page 585**
- **source on page 589**

refresh-from

Syntax refresh-from *url*;

Hierarchy Level [edit **event-options event-script**],
[edit **event-options event-script file** *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Junos OS event scripts, overwrite the local copy of all enabled event scripts or a single enabled script located in the **/var/db/scripts/event** directory with the copy located at a URL other than the URL specified in the **source** statement.

Options *url*—Source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Updating an Event Script from an Alternate Location
- **refresh on page 585**
- **source on page 589**

remote-execution

Syntax

```
remote-execution {
  remote-hostname {
    passphrase user-password;
    username user-login;
  }
}
```

Hierarchy Level [edit **event-options event-script file** *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Junos OS event scripts, enable event scripts to invoke RPCs on a local or remote host.

Options

passphrase ***user-password***—User's password for the remote host.

remote-hostname—Name of the remote host with which the event script will communicate.

username ***username***—User's login name for the remote host.

Required Privilege Level

maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Using RPCs and Operational Mode Commands in Event Scripts

retry-count

Syntax retry-count *number* retry-interval *seconds*;

Hierarchy Level [edit **event-options policy** *policy-name* **then event-script** *filename* **destination** *destination-name*],
[edit **event-options policy** *policy-name* **then execute-commands destination** *destination-name*],
[edit **event-options policy** *policy-name* **then upload** filename (*filename* | committed) destination *destination-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an event policy to retry a file upload operation if the first attempt fails.

Default If you do not include this statement, the file upload operation is attempted one time only.

Options ***number***—Number of retries.

retry-interval *seconds*—Length of time to wait between retries.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Configuring an Event Policy to Retry the File Upload Action

size

Syntax size *size*;

Hierarchy Level [edit system syslog **archive**],
[edit system syslog file *filename* archive]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***. For information about the number of archive files that the utility creates in this way, see **files**.

Options ***size***—Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

Syntax: ***x*k** to specify the number of kilobytes, ***x*m** for the number of megabytes, or ***x*g** for the number of gigabytes

Range: 64 KB through 1 GB

Default: 1 MB for MX Series routers

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Specifying Log File Size, Number, and Archiving Properties
- *Junos OS System Log Messages Reference*
- **files on page 576**

source

Syntax source *url*;

Hierarchy Level [edit **event-options event-script file** *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Junos OS event scripts, specify the location of the source file for an enabled script located in the **/var/db/scripts/event** directory. When you include the **refresh** statement at the same hierarchy level, the local copy is overwritten by the version stored at the specified URL.

Options *url*—Master source file for an event script specified as an HTTP URL, FTP URL, or scp-style remote file specification.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- **refresh on page 585**
- **refresh-from on page 585**
- Specifying a Master Source for an Event Script

structured-data

Syntax

```
structured-data {
  brief;
}
```

Hierarchy Level [edit system syslog file *filename*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, *The syslog Protocol* (http://tools.ietf.org/html/draft-ietf-syslog-protocol-23).

NOTE: When this statement is included, other statements that specify the format for messages written to the file are ignored (the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level and the **time-format** statement at the **[edit system syslog]** hierarchy level).

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Logging Messages in Structured-Data Format
- *Junos OS System Log Messages Reference*
- **explicit-priority on page 572**
- **time-format on page 594**

syslog

Syntax

```
syslog {
  archive {
    files number;
    size maximum-file-size;
    start-time "YYYY-MM-DD.hh:mm";
    transfer-interval minutes;
    (world-readable | no-world-readable);
  }
  console {
    facility severity;
  }
  file filename {
    facility severity;
    explicit-priority;
    match "regular-expression";
    archive {
      files number;
      size maximum-file-size;
      start-time "YYYY-MM-DD.hh:mm";
      transfer-interval minutes;

    }
  }
  host (hostname | other-routing-engine | scc-master) {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string;
    match "regular-expression";
  }
  source-address source-address;
  time-format (millisecond | year | year millisecond);
  user (username | *) {
    facility severity;
    match "regular-expression";
  }
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the types of system log messages to log to files, a remote destination, user terminals, or the system console.

The remaining statements are explained separately.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Junos OS System Log Configuration Overview
- *Junos OS System Log Messages Reference*

then

Syntax

```
then {
  event-script filename {
    arguments {
      argument-name argument-value;
    }
    destination destination-name {
      retry-count count retry-interval seconds;
      transfer-delay seconds;
    }
    output-filename filename;
    output-format (text | xml);
    user-name username;
  }
  execute-commands {
    commands {
      "command";
    }
    destination destination-name {
      retry-count count retry-interval seconds;
      transfer-delay seconds;
    }
    output-filename filename;
    output-format (text | xml);
    user-name username;
  }
  ignore;
  raise-trap;
  upload filename (filename | committed) destination destination-name {
    retry-count count retry-interval seconds;
    transfer-delay seconds;
    user-name username;
  }
}
```

Hierarchy Level [edit event-options policy *policy-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define actions to take if an event occurs. For each policy, you can configure multiple actions.

The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Configuring an Event Policy to Upload Files
- Configuring an Event Policy to Execute Operational Mode Commands
- Executing Event Scripts in an Event Policy

- Configuring Event Policies to Ignore an Event
- Configuring Event Policies to Raise SNMP Traps

time-format

Syntax time-format (year | millisecond | year millisecond);

Hierarchy Level [edit system syslog]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, **Aug 21 12:36:30**.

NOTE: When the **structured-data** statement is included at the **[edit system syslog file *filename*]** hierarchy level, this statement is ignored for the file.

Options **millisecond**—Include the millisecond in the timestamp.

year—Include the year in the timestamp.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Including the Year or Millisecond in Timestamps
- *Junos OS System Log Messages Reference*
- **structured-data on page 590**

time-interval

Syntax time-interval *seconds*;

Hierarchy Level [edit **event-options generate-event** *event-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a frequency at which to generate a particular event.

Options ***seconds***—Time interval between internally generated events.
Range: 60 through 604,800 seconds

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Generating Internal Events to Trigger Event Policies

time-of-day

Syntax time-of-day *hh*:*mm*:*ss*;

Hierarchy Level [edit **event-options generate-event** *event-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a time of day at which to generate a particular event.

Options ***hh*:*mm*:*ss***—Time of day at which to generate an event.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Generating Internal Events to Trigger Event Policies

time-zone

Syntax time-zone (GMT *hour-offset* | *time-zone*);

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the local time zone. To have the time zone change take effect for all processes running on the router or switch, you must reboot the router or switch.

Default UTC

Options GMT *hour-offset*—Set the time zone relative to UTC time.

Range: –14 through +12

Default: 0

time-zone—Specify the time zone as **UTC**, which is the default time zone, or as a string such as PDT (Pacific Daylight Time), or use one of the following continents and major cities:

Africa/Abidjan, Africa/Accra, Africa/Addis_Ababa, Africa/Algiers, Africa/Asmera, Africa/Bamako, Africa/Bangui, Africa/Banjul, Africa/Bissau, Africa/Blantyre, Africa/Brazzaville, Africa/Bujumbura, Africa/Cairo, Africa/Casablanca, Africa/Ceuta, Africa/Conakry, Africa/Dakar, Africa/Dar_es_Salaam, Africa/Djibouti, Africa/Douala, Africa/El_Aaiun, Africa/Freetown, Africa/Gaborone, Africa/Harare, Africa/Johannesburg, Africa/Kampala, Africa/Khartoum, Africa/Kigali, Africa/Kinshasa, Africa/Lagos, Africa/Libreville, Africa/Lome, Africa/Luanda, Africa/Lubumbashi, Africa/Lusaka, Africa/Malabo, Africa/Maputo, Africa/Maseru, Africa/Mbabane, Africa/Mogadishu, Africa/Monrovia, Africa/Nairobi, Africa/Ndjamena, Africa/Niamey, Africa/Nouakchott, Africa/Ouagadougou, Africa/Porto-Novo, Africa/Sao_Tome, Africa/Timbuktu, Africa/Tripoli, Africa/Tunis, Africa/Windhoek

traceoptions

Syntax

```
traceoptions {
  file <filename> <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Hierarchy Level [edit **event-options event-script**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for event scripts.

Default If you do not include this statement, no event script–specific tracing operations are performed.

Options ***filename***—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. By default, event script process tracing output is placed in the file **escript.log**. If you include the **file** statement, you must specify a filename. To retain the default, you can specify **escript.log** as the filename.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**, then ***trace-file*.1.gz**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

Range: 2 through 1000

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Log all operations
- **events**—Log important events
- **input**—Log event script input data
- **offline**—Generate data for offline development
- **output**—Log event script output data
- **rpc**—Log event script RPCs
- **xslt**—Log the XSLT library

no-world-readable—Restrict file access to owner. This is the default.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed

and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and a filename.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—Enable unrestricted file access.

Required Privilege Level

maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Tracing Event Script Processing

traceoptions

Syntax

```
traceoptions {
  file <filename> <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Hierarchy Level [edit **event-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for event policies.

Default If you do not include this statement, no event-policy-specific tracing operations are performed.

Options ***filename***—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. By default, commit script process tracing output is placed in the file **eventd**. If you include the **file** statement, you must specify a filename. To retain the default, you can specify **eventd** as the filename.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**, then ***trace-file*.1.gz**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

Range: 2 through 1000

Default: 3 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Log all operations
- **configuration**—Log reading of configuration at the **[edit event-options]** hierarchy level
- **events**—Log eventd processing
- **database**—Log events involving storage and retrieval in events database
- **server**—Log communication with processes that are generating events
- **timer-events**—Log internally generated events

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—Restrict file access to owner. This is the default.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed and compressed to ***trace-file*.0.gz**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

traceoptions (Commit and Op Scripts)

Syntax

```
traceoptions {
  file <filename> <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Hierarchy Level [edit system scripts commit],
[edit system scripts op]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for commit or op scripts.

Default If you do not include this statement, no script-specific tracing operations are performed.

Options ***filename***—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. By default, commit script process tracing output is placed in the file **cscript.log** and op script process tracing is placed in the file **op-script.log**. If you include the **file** statement, you must specify a filename. To retain the default, you can specify **cscript.log** or **op-script.log** as the filename.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed and compressed to ***trace-file*.0.gz**, then ***trace-file*.1.gz**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

Range: 2 through 1000

Default: 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Log all operations
- **events**—Log important events
- **input**—Log script input data
- **offline**—Generate data for offline development
- **output**—Log script output data
- **rpc**—Log script RPCs
- **xslt**—Log the XSLT library

no-world-readable—Restrict file access to owner. This is the default.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed and compressed to ***trace-file*.0.gz**. When ***trace-file*** again reaches its maximum size, ***trace-file*.0.gz** is renamed ***trace-file*.1.gz** and ***trace-file*** is renamed and compressed to ***trace-file*.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and a filename.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—Enable unrestricted file access.

Required Privilege Level

maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Tracing Op Script Processing

transfer-delay

Syntax transfer-delay *seconds*;

Hierarchy Level [edit **event-options destinations** *destination-name*],
[edit **event-options policy** *policy-name* **then event-script** *filename* **destination** *destination-name*],
[edit **event-options policy** *policy-name* **then execute-commands destination** *destination-name*],
[edit **event-options policy** *policy-name* **then upload** filename (*filename* | committed) destination *destination-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a delay before transferring files. This allows the files to be completely generated before the upload starts. If you configure a transfer delay at the **[edit event-options destination *destination-name*]** hierarchy level and at one of the **[edit event-options policy *policy-name* then ...]** hierarchy levels, the resulting delay is the sum of the two delays.

Default If you do not include this statement, there is no transfer delay.

Options ***seconds***—Duration of the delay before files are uploaded.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Defining Destinations for File Archiving by Event Policies
- Configuring the Delay Before Files Are Uploaded by an Event Policy

trigger

Syntax trigger (on | after | until) *event-count*;

Hierarchy Level [edit **event-options policy** *policy-name* **within** *seconds*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an event policy to be triggered if an event or set of events occurs ***event-count*** times within a specified time period.

Default If you do not include this statement, the policy is executed on receipt of the first configured event.

Options

after *event-count*—The policy is executed when the number of matching events received equals ***event-count*** + 1.

on *event-count*—The policy is executed when the number of matching events received equals ***event-count***.

until *event-count*—The policy is executed each time a matching event is received and stops being executed when the number of matching events received equals ***event-count***.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- Triggering an Event Policy Based on Event Count

upload

Syntax

```
upload filename  (filename | committed) destination destination-name {
    retry-count count retry-interval seconds;
    transfer-delay seconds;
    user-name username;
}
```

Hierarchy Level [edit **event-options policy** *policy-name* **then**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description On receipt of an event, upload the committed configuration file to a destination.

Options

destination ***destination-name***—Name of the destination for the uploaded file. It must be defined in the **destinations** statement at the **[edit event-options]** hierarchy level.

filename (*filename* | committed)—Name of the file to upload. Specify either the word **committed** to upload the most recently committed configuration file, or the filename of another file.

The remaining statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation

- **destinations on page 566**

user (System Logging)

Syntax

```
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

Hierarchy Level [edit system **syslog**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the logging of system messages to user terminals.

Options

***** (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see Junos OS System Logging Facilities and Message Severity Levels.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities the specified level and higher are logged. For a list of the severities, see Junos OS System Logging Facilities and Message Severity Levels.

username—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one **user** statement.

The remaining statement is explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Directing System Log Messages to a User Terminal.
- Junos OS System Logging Facilities and Message Severity Levels
- *Junos OS System Log Messages Reference*

user-name

Syntax user-name *username*;

Hierarchy Level [edit **event-options policy** *policy-name* **then event-script** *filename*],
[edit **event-options policy** *policy-name* **then execute-commands**],
[edit **event-options policy** *policy-name* **then upload** filename (*filename* | committed) destination *destination-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a user with an action in an event policy. The event policy action is executed under the privileges of the associated user.

Default If you do not associate a user with an action, the action is executed as user **root**.

Options ***username***—A username that is configured at the **[edit system login]** hierarchy level.

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Changing the User Privilege Level for an Event Policy Action

within

Syntax
```
within seconds {
  events [ events ];
  not events [ events ];
  trigger (after | on | until) event-count;
}
```

Hierarchy Level [edit **event-options policy** *policy-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a list of events that must (or must not) occur within a specified time interval for the policy to be triggered.

The statements are explained separately.

Options ***seconds***—Interval between events.

Range: 60 through 604,800 seconds

Required Privilege Level maintenance—To view this statement in the configuration.
maintenance-control—To add this statement to the configuration.

Related Documentation
- Using Correlated Events to Trigger an Event Policy

world-readable

Syntax world-readable | no-world-readable;

Hierarchy Level [edit system syslog **archive**],
[edit system syslog file *filename* archive]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Grant all users permission to read log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

Default **no-world-readable**

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

CHAPTER 42

Operational Mode Commands for System Monitoring

clear log

Syntax clear log *filename*
<all>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Remove contents of a log file.

Options *filename*—Name of the specific log file to truncate.

all—(Optional) Truncate the specified log file and delete all archived versions of it.

Required Privilege Level clear

Related Documentation
- **show log on page 657**

List of Sample Output **clear log on page 612**

Output Fields See **file list** for an explanation of output fields.

clear log The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
--------------------------------------------------------------------------
-rw-r-----  1 root  wheel      26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
--------------------------------------------------------------------------

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
--------------------------------------------------------------------------
-rw-r-----  1 root  wheel         57 Sep 15 03:44 /var/log/sampled
total 1
```

file archive

Syntax file archive destination *destination* source *source* <compress>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.

Options

destination *destination*—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:

- For archived files—The suffix **.tar**
- For archived and compressed files—The suffix **.tgz**

source *source*—Source of the original file or files. Specify the source as a URL or filename.

compress—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix **.tgz**.

Required Privilege Level maintenance

List of Sample Output

file archive (Multiple Files) on page 613
file archive (Single File) on page 613
file archive (with Compression) on page 614

Output Fields When you enter this command, you are provided feedback on the status of your request.

file archive (Multiple Files) The following sample command archives all message files in the local directory **/var/log/messages** as the single file **messages-archive.tar** in the same directory:

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.

user@host>
```

file archive (Single File) The following sample command archives one message file in the local directory **/var/log/messages** as the single file **messages-archive.tar** in the same directory:

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz** in the same directory:

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.

user@host>
```

file checksum md5

Syntax file checksum md5 <*pathname*> *filename*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Calculate the Message Digest 5 (MD5) checksum of a file.

Options *pathname*—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the MD5 checksum.

Required Privilege Level maintenance

- **op on page 207**

List of Sample Output **file checksum md5 on page 615**

Output Fields When you enter this command, you are provided feedback on the status of your request.

file checksum md5

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

file checksum sha1

Syntax file checksum sha1 <*pathname*> *filename*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.

Options *pathname*—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the SHA-1 checksum.

Required Privilege Level maintenance

Related Documentation

- **file checksum sha-256 on page 366**
- **op on page 207**

List of Sample Output **file checksum sha1 on page 616**

Output Fields When you enter this command, you are provided feedback on the status of your request.

file checksum sha1

```
user@host> file checksum sha1 /var/db/scripts/opscript.slax

SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

file checksum sha-256

Syntax file checksum sha-256 <*pathname*> *filename*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.

Options *pathname*—(Optional) Path to a filename.

filename—Name of a local file for which to calculate the SHA-256 checksum.

Required Privilege Level maintenance

List of Sample Output **file checksum sha-256 on page 617**

Output Fields When you enter this command, you are provided feedback on the status of your request.

file checksum sha-256

```
user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

file compare

Syntax file compare (files *filename filename*)
< context | unified>
<ignore-white-space >

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Compare two local files and describe the differences between them in default, context, or unified output styles:

- **Default**—In the first line of output, **c** means lines were changed between the two files, **d** means lines were deleted between the two files, and **a** means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (**<**) in front of output lines refers to the first file. A right angle bracket (**>**) in front of output lines refers to the second file.
- **Context**—Display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (**!**) have changed. Additions are marked with a plus sign (**+**), and deletions are marked with a minus sign (**-**).
- **Unified**—Display is preceded by the line number from the first and the second file (*xx*,*xxx*,*x*). Before the line number, additions to the file are marked with a plus sign (**+**), and deletions to the file are marked with a minus sign (**-**). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.

Options files *filename*—Names of two local files to compare.

context—(Optional) Display output in context format.

ignore-white-space—(Optional) Ignore changes in amount of white space.

unified—(Optional) Display output in unified format.

Required Privilege Level none

List of Sample Output
file compare files on page 619
file compare files context on page 619
file compare files unified on page 619
file compare files unified ignore-white-space on page 620

Output Fields When you enter this command, you are provided feedback on the status of your request.

file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<             full-name "File 1";
---

file copy

Syntax

file copy *source destination*
<source-address *address*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Copy files from one place to another on the local router or switch or between the local router or switch and a remote system.

Options

source—Source of the original file. Specify this as a URL or filename.

destination—Destination of the copied file. Specify this as a URL or filename. If you are copying a file to the current directory (your home directory on the local router or switch) and are not renaming the file, specify the destination with a period (.).

source-address *address*—(Optional) Source IP host address. This option is useful for specifying the source address of a secure copy (scp) file transfer.

Required Privilege Level

maintenance

List of Sample Output

file copy (A File from the Router to a PC) on page 621
file copy (A Configuration File Between Routing Engines) on page 621
file copy (A Log File Between Routing Engines) on page 621

Output Fields

When you enter this command, you are provided feedback on the status of your request.

file copy (A File from the Router to a PC)

```
user@host> file copy /var/tmp/rpd.core.4 berry:/c/junipero/tmp

...transferring.file..... |          0 KB |   0.3 kB/s | ETA: 00:00:00 | 100%
```

file copy (A Configuration File Between Routing Engines)

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host>  file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

file copy (A Log File Between Routing Engines)

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassisd lcc0-re1:/var/tmp
```

file delete

Syntax
file delete *filename*
<purge>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Delete a file on the local router or switch.

Options
filename—Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.

purge—(Optional) Overwrite regular files before deleting them.

Required Privilege Level
maintenance

List of Sample Output
file delete on page 622

Output Fields
When you enter this command, you are provided feedback on the status of your request.

file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file list

Syntax
file list
<detail | recursive>
<*filename*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display a list of files on the local router or switch.

Options
none—Display a list of all files for the current directory.

detail | recursive—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.

filename—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.

Additional Information
The default directory is the home directory of the user logged into the router or switch. To view available directories, enter a space and then a backslash (/) after the **file list** command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the **file list** command.

Required Privilege Level
maintenance

List of Sample Output
file list on page 623

Output Fields
When you enter this command, you are provided feedback on the status of your request.

file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

file rename

Syntax file rename *source destination*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Rename a file on the local router or switch.

Options *destination*—New name for the file.

source—Original name of the file. For a routing matrix, the filename must include the chassis information.

Required Privilege Level maintenance

List of Sample Output **file rename on page 624**

Output Fields When you enter this command, you are provided feedback on the status of your request.

file rename The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

file show

Syntax file show *filename*
<encoding base64>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the contents of a file.

Options *filename*—Name of a file. For a routing matrix, the filename must include the chassis information.

encoding base64—(Optional) Encode file contents.

Required Privilege Level maintenance

List of Sample Output file show on page 625

Output Fields When you enter this command, you are provided feedback on the status of your request.

file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
...
```

monitor list

Syntax monitor list

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the status of monitored log and trace files.

Options This command has no options.

Additional Information Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the **syslog** statement at the **[edit system]** hierarchy level and the **options** statement at the **[edit routing-options]** hierarchy level. The trace files generated by the routing protocol process are those configured with **traceoptions** statements at the **[edit routing-options]**, **[edit interfaces]**, and **[edit protocols *protocol*]** hierarchy levels.

Required Privilege Level trace

List of Sample Output **monitor list on page 626**

Output Fields Table 82 on page 626 describes the output fields for the **monitor list** command. Output fields are listed in the approximate order in which they appear.

Table 82: monitor list Output Fields

Field Name	Field Description
monitor start	Indicates the file is being monitored.
"*filename*"	Name of the file that is being monitored.
Last changed	Date and time at which the file was last modified.

monitor list

```
user@host> monitor list
monitor start "vrrpd" (Last changed Dec 03:11:06 20)
monitor start "cli-commands" (Last changed Nov 07:3)
```

monitor start

Syntax monitor start *filename*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Start displaying the system log or trace file and additional entries being added to those files.

Options *filename*—Specific log or trace file.

Additional Information Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the **syslog** statement at the **[edit system]** hierarchy level and the **options** statement at the **[edit routing-options]** hierarchy level. The trace files generated by the routing protocol process are configured with **traceoptions** statements at the **[edit routing-options]**, **[edit interfaces]**, and **[edit protocols *protocol*]** hierarchy levels.

Required Privilege Level trace

List of Sample Output **monitor start on page 627**

Output Fields Table 83 on page 627 describes the output fields for the **monitor start** command. Output fields are listed in the approximate order in which they appear.

Table 83: monitor start Output Fields

Field Name	Field Description
******filename******	Name of the file from which entries are being displayed. This line is displayed initially and when the command switches between log files.
Date and time	Timestamp for the log entry.

monitor start

```
user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: RSA key generation complete.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: RSA authentication for root accepted.
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from trip.jcmax.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
```

monitor stop

Syntax monitor stop *filename*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Stop displaying the system log or trace file.

Options *filename*—Specific log or trace file.

Additional Information Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the **syslog** statement at the **[edit system]** hierarchy level and the **options** statement at the **[edit routing-options]** hierarchy level. The trace files generated by the routing protocol process are those configured with **traceoptions** statements at the **[edit routing-options]**, **[edit interfaces]**, and **[edit protocols *protocol*]** hierarchy levels.

request system configuration rescue save

```
user@host> request system configuration rescue save
```

request system scripts refresh-from commit

Syntax **request system scripts refresh-from commit file *file-name* url *url-path***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Automatically download the initial Junos OS configuration and a set of standard commit scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:

```
<request-script-refresh-from>
   <type>commit</type>
   <file>file-name></file>
   <URL>URL</URL>
</request-script-refresh-from>
```

Options file *file-name*—Name of the file to be downloaded.

url *url-path*—URL of the file to be downloaded.

Required Privilege Level maintenance

request system scripts refresh-from event file config.txt url http://host1.juniper.net

```
user@switch> request system scripts refresh-from event file config.txt url http://host1.juniper.net
user@switch>
```

request system scripts refresh-from op

Syntax **request system scripts refresh-from op file *file-name* url *url-path***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Automatically download the initial Junos OS configuration and a set of standard op scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.

The Junos XML management protocol equivalent for this operational mode command is:

```
<request-script-refresh-from>
   <type>op</type>
   <file>file-name></file>
   <URL>URL</URL>
</request-script-refresh-from>
```

Options file *file-name*—Name of the file to be downloaded.

url *url-path*—URL of the file to be downloaded.

Required Privilege Level maintenance

```
user@switch> request system scripts refresh-from op file config.txt url http://host1.juniper.net
user@switch>
```

show chassis alarms

Syntax show chassis alarms

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about the conditions that have been configured to trigger alarms.

Options none—Display information about the conditions that have been configured to trigger alarms.

Additional Information You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

Required Privilege Level view

List of Sample Output
show chassis alarms (Alarms Active) on page 634
show chassis alarms (No Alarms Active) on page 634
show chassis alarms (Backup Routing Engine) on page 634

Output Fields Table 84 on page 634 lists the output fields for the **show chassis alarms** command. Output fields are listed in the approximate order in which they appear.

Table 84: show chassis alarms Output Fields

Field Name	Field Description
Alarm time	Date and time the alarm was first recorded.
Class	Severity class for this alarm: **Minor** or **Major**.
Description	Information about the alarm.

show chassis environment

Syntax show chassis environment

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.

Options none—Display environmental information about the router or switch chassis.

For information about the remaining options, see the Related Topics.

Required Privilege Level view

Output Fields Table 85 on page 635 lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 85: show chassis environment Output Fields

Field Name	Field Description
Class	Item, Status, Measurement
Power	Information about each power supply. **Status** can be **OK**, **Testing** (during initial power-on), **Check**, **Failed**, or **Absent**.
Temp	Temperature of air flowing through the chassis. **Measurement** indicates degrees in Celsius (C) and Fahrenheit (F).
Fan	Information about the fans. **Status** can be **OK**, **Testing** (during initial power-on), **Failed**, or **Absent**. **Measurement** indicates if fans are spinning at normal or high speed.
Misc	Information about other components of the chassis.

show chassis environment fpc

Syntax show chassis environment fpc
<*slot*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description (J-EX Series switches) Display environmental information about Flexible PIC Concentrators (FPCs).

Options none—Display environmental information about all FPCs.

slot—(Optional) Display environmental information about an individual FPC:

- user@host> **show chassis environment fpc 1 lcc 1**
  user@host> **show chassis environment fpc 9**
- J-EX Series switches:
  - J-EX4200 standalone switches—Replace ***slot*** with 0.
  - J-EX4200 switches in a Virtual Chassis configuration—Replace ***slot*** with a value from 0 through 9 (switch's member ID).
  - J-EX8208 switches—Replace ***slot*** with a value from 0 through 7 (line card).
  - J-EX8216 switches—Replace ***slot*** with a value from 0 through 15 (line card).

Required Privilege Level view

Output Fields Table 86 on page 637 lists the output fields for the **show chassis environment fpc** command. Output fields are listed in the approximate order in which they appear.

Table 86: show chassis environment fpc Output Fields

Field Name	Field Description
State	Status of the FPC: • **Unknown**—FPC is not detected by the router. • **Empty**—No FPC is present. • **Present**—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online. • **Ready**—FPC is in intermediate or transition state. • **Announce online**—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative. • **Online**—FPC is online and running. • **Offline**—FPC is powered down. • **Diagnostics**—FPC is set to operate in diagnostics mode.
Power	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.

show chassis environment routing-engine

Syntax show chassis environment routing-engine
<*slot*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Routing Engine environmental status information.

Options none—Display environmental information about all Routing Engines.

slot—(Optional) Display environmental information about an individual Routing Engine. . On J-EX4200 standalone switches, replace ***slot*** with 0. On J-EX4200 switches in a Virtual Chassis configuration and on J-EX8208 and J-EX8216 switches, replace ***slot*** with 0 or 1.

show chassis environment routing-engine (Redundant) on page 638

Output Fields Table 87 on page 638 lists the output fields for the **show chassis environment routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 87: show chassis environment routing-engine Output Fields

Field Name	Field Description
Routing engine *slot* status	Number of the Routing Engine slot: **0** or **1**.
State	Status of the Routing Engine: • **Online Master**—MCS is online, operating as Master. • **Online Standby**—MCS is online, operating as Standby.
Temperature	Temperature of the air flowing past the Routing Engine.

show chassis environment routing-engine (Nonredundant)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                          Online Master
  Temperature                 27 degrees C / 80 degrees
```

show chassis environment routing-engine (Redundant)

```
user@host> show chassis environment routing-engine
Route Engine 0 status:
  State:                       Online Master
  Temperature:               26 degrees C / 78 degrees F
Route Engine 1 status:
  State:                       Online Standby
  Temperature:               26 degrees C / 78 degrees F
```

show chassis fpc

Syntax
show chassis fpc
<detail <*fpc-slot*>> | <pic-status <*fpc-slot*>>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

Options
none—Display status information for all FPCs.

detail—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see ***fpc-slot***).

fpc-slot—(Optional) FPC slot number:

- J-EX Series switches:
  - J-EX4200 standalone switches—Replace ***fpc-slot*** with 0.
  - J-EX4200 switches in a Virtual Chassis configuration—Replace ***fpc-slot*** with a value from 0 through 9 (switch's member ID).
  - J-EX8208 switches—Replace ***fpc-slot*** with a value from 0 through 7 (line card).
  - J-EX8216 switches—Replace ***fpc-slot*** with a value from 0 through 15 (line card).

pic-status—(Optional) Display status information for all PICs or for the PIC in the specified slot (see ***fpc-slot***).

Output Fields
Table 88 on page 640 lists the output fields for the**show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

Table 88: show chassis fpc Output Fields

Field Name	Field Description	Level of Output
Slot or **Slot State**	Slot number and state. The state can be one of the following conditions: • **Dead**—Held in reset because of errors. • **Diag**—Slot is being ignored while the FPC is running diagnostics. • **Dormant**—Held in reset. • **Empty**—No FPC is present. • **Online**—FPC is online and running. • **Present**—FPC is detected by the chassis daemon but is either not supported by the current version of Junos OS or inserted in the wrong slot. The output also states either **Hardware Not Supported** or **Hardware Not In Right Slot**. FPC is coming up but not yet online. • **Probed**—Probe is complete; awaiting restart of the Packet Forwarding Engine (PFE). • **Probe-wait**—Waiting to be probed.	all levels
Logical slot	Slot number.	all levels
Temp (C) or Temperature	Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.	all levels
Total CPU Utilization (%)	Total percentage of CPU being used by the FPC's processor.	all levels
Interrupt CPU Utilization (%)	Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.	none specified
Memory DRAM (MB)	Total DRAM, in megabytes, available to the FPC's processor.	none specified
Heap Utilization (%)	Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak).	none specified
Buffer Utilization (%)	Percentage of buffer space being used by the FPC's processor for buffering internal messages.	none specified
Total CPU DRAM	Amount of DRAM available to the FPC's CPU.	**detail**
Total RLDRAM	Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.	**detail**
Total DDR DRAM	Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.	**detail**
Total SRAM	Amount of static RAM (SRAM) used by the FPC's CPU.	**detail**
Total SDRAM	Total amount of memory used for storing packets and notifications.	**detail**

Table 88: show chassis fpc Output Fields *(continued)*

Field Name	Field Description	Level of Output
I/O Manager ASICs information	I/O Manager version number, manufacturer, and part number.	**detail**
Start time	Time when the Routing Engine detected that the FPC was running.	**detail**
Uptime	How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.	**detail**
PIC type	(**pic-status** output only) Type of PIC.	none specified

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.

In J-EX Series switch command output, FPC refers to the following:

- On J-EX4200 standalone switches—Refers to the switch; ***fpc-number*** is always 0.
- On J-EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC ***number*** equals the member ID, from 0 through 9.
- On J-EX8208 and J-EX8216 switches—Refers to a line card; FPC ***number*** equals the slot number for the line card.

Options none—Display information about hardware.

clei-models—(Optional) Display Common Language Equipment Identifier (CLEI) bar code and model number for orderable field-replaceable units (FRUs).

detail—(Optional) Include RAM and disk information in output.

extensive—(Optional) Display ID EEPROM information.

models—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

show chassis hardware clei-models (J-EX8216 Switch) on page 645

Output Fields Table 89 on page 644 lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 89: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
Item	Chassis—Information about the chassis, Routing Engine (SRE and RE modules in J-EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for J-EX8200 switches. See J-EX Series Switches Hardware and CLI Terminology Mapping.	All levels
Version	Revision level of the chassis component.	All levels
Part number	Part number of the chassis component.	All levels
Serial number	Serial number of the chassis component. The serial number of the backplane is also the serial number of the chassis. Use this serial number when you need to contact Dell Support (see "Requesting Technical Support" on page lxxi) about the chassis.	All levels
Assb ID or **Assembly ID**	(**extensive** output only) Identification number that describes the FRU hardware.	All levels
FRU model number	(**clei-models**, **extensive**, and **models** keyword only) Model number of FRU hardware component.	none specified
CLEI code	(**clei-models** and **extensive**keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
EEPROM Version	ID EEPROM version used by hardware component: **0x01** (version 1) or **0x02** (version 2).	**extensive**
Description	Brief description of the hardware item: • Type of power supply. • Type of PIC. If the PIC type is not supported on the current software release, the output states **Hardware Not Supported** • Type of FPC: **FPC Type 1**, **FPC Type 2**, **FPC Type 3**, **FPC Type 4** , or **FPC Type OC192**, . A brief description of the FPC. • **MPC M 16x 10GE**—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on J-EX Series switches.) • For hosts, the Routing Engine type. • For small form-factor pluggable transceiver (SFP) modules, the type of fiber: **LX**, **SX**, **LH**, or **T**. • LCD description for J-EX Series switches. show chassis led

Syntax **show chassis led**
<fpc-slot <*fpc-slot-number*>>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the status and colors of the chassis LEDs on the front of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.

Options none—Display the status of the chassis status LEDs (for J-EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).

fpc-slot <*fpc-slot-number*>—(Optional) Display the information as follows:

- For the standalone J-EX4200 switch (***fpc-slot-number*** equals 0)
- For all J-EX4200 switches in a Virtual Chassis (**fpc-slot** with no ***fpc-slot-number*** value specified)
- For a specific Virtual Chassis member (***fpc-slot-number*** equals member ID value)
- For the line card in the specified slot on a J-EX8200 switch (***fpc-slot-number*** equals slot number)

Required Privilege Level view

- Chassis Status LEDs in a J-EX8200 Switch

Output Fields Table 90 on page 646 lists the output fields for the **show chassis led** command. Output fields are listed in the approximate order in which they appear.

Table 90: show chassis led Output Fields

Field Name	Field Description
Front panel contents for slot	FPC slot number of the switch whose content is being displayed. The number is always **0**, except for J-EX4200 switches in a Virtual Chassis, where it is the member ID value.
Front panel contents (EX8200 switches)	On J-EX8200 switches, no slot number is displayed.

Table 90: show chassis led Output Fields *(continued)*

Field Name	Field Description
Alarms LED	Displays status of the ALM LED: • Off—No alarm has been configured. • Green—No alarm has been triggered. • Red—Major alarm. • Yellow—Minor alarm
System LED	Displays status of the SYS LED: • Off—Switch is powered off. • Green—Switch is operating normally. • Yellow—Switch is booting.

Master LED	Displays status of the MST LED (on J-EX4200, and J-EX8200 switches):
	• Green—On a J-EX4200 Virtual Chassis switch, indicates the switch is the master in the Virtual Chassis configuration. On other switches, indicates that the Routing Engine is operational.
	• Off
	  ◦ On a J-EX4200 Virtual Chassis switch, indicates that this switch is not the master in the Virtual Chassis configuration.
	  ◦ On standalone J-EX4200, and J-EX8200 switches, indicates that the Routing Engine is not operational.

Interface	Names of the interfaces on the switch.
LED (ADM/SPD/DPX/POE)	State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are: NOTE: J-EX8200 switches do not have the POE port parameter. • **ADM**—Administrative • **SPD**—Speed • **DPX**—Duplex • **POE**—Power over Ethernet

show chassis location

Syntax show chassis location

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the physical location of the chassis. This command can only be used on the master Routing Engine.

Options none—Display all information about the physical location of the chassis.

Required Privilege Level view

List of Sample Output **show chassis location on page 649**
show chassis location on page 649

Output Fields Table 91 on page 649 lists the output fields for the **show chassis location** command. Output fields are listed in the approximate order in which they appear.

Table 91: show chassis location Output Fields

Field Name	Field Description
country-code	Country code information.
postal-code	Postal code information.
Building	Building information.
Floor	Floor information.
Global FPC	Global FPC number. The FPC slot number, when all FPC slots in the Routing Matrix are considered. The range of values is **0** through **31**.
LCC	Line-card chassis number.
Local FPC	Local FPC number.

show chassis pic

Syntax show chassis pic fpc-slot *slot-number* pic-slot *slot-number*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.

Options fpc-slot *slot-number*—Display information about the PIC in this particular FPC slot:

- J-EX Series switches:
  - J-EX4200 standalone switches—Replace ***slot-number*** with 0.
  - J-EX4200 switches in a Virtual Chassis configuration—Replace ***slot-number*** with a value from 0 through 9 (switch's member ID).
  - J-EX8208 switches—Replace ***slot-number*** with a value from 0 through 7 (line card).
  - J-EX8216 switches—Replace ***slot-number*** with a value from 0 through 15 (line card).

pic-slot *slot-number*—Display information about the PIC in this particular PIC slot. For routers, replace ***slot-number*** with a value from **0** through **3**. For J-EX4200 switches, replace ***slot-number*** with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For J-EX8208 and J-EX8216 switches, replace ***slot-number*** with 0.

Output Fields Table 92 on page 650 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

Table 92: show chassis pic Output Fields

Field Name	Field Description
Type	PIC type.
ASIC type	Type of ASIC on the PIC.

Table 92: show chassis pic Output Fields *(continued)*

Field Name	Field Description
State	Status of the PIC. State is displayed only when a PIC is in the slot. • **Online**— PIC is online and running. • **Offline**—PIC is powered down.
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.
Package	(MultiServices PICs only) Services package supported: **Layer-2** or **Layer-3**.
PIC Port Information	Port-level information for the PIC.
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: **LH**, **LX**, or **SX**

PIC Port Information (MX960 Router Bidirectional Optics)	Port-level information for the PIC.
	• Port—Port number
	• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.
	• Fiber type—Type of fiber. SM is single-mode.
	• Xcvr vendor—Transceiver vendor name.
	• Xcvr vendor part number—Transceiver vendor part number.
	  ◦ BX10-10-km bidirectional optics.
	  ◦ BX40-40-km bidirectional optics.
	  ◦ SFP-LX-40-km SFP optics.
	• Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.

show chassis routing-engine

Syntax show chassis routing-engine
<bios | *slot*>

Syntax (J-EX Series Switch) show chassis routing-engine
<*slot*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the status of the Routing Engine.

Options none—Display information about one or more Routing Engines.

bios—(Optional) Display the basic input/output system (BIOS) firmware version.

slot—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace ***slot*** with 0 or 1.

Required Privilege Level view

Related Documentation

Output Fields Table 93 on page 653 lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 93: show chassis routing-engine Output Fields

Field Name	Field Description
Slot	(Systems with multiple Routing Engines) Slot number.
Current state	(Systems with multiple Routing Engines) Current state of the Routing Engine: **Master**, **Backup**, or **Disabled**.
Election priority	(Systems with multiple Routing Engines) Election priority for the Routing Engine: **Master** or **Backup**.
Temperature	Temperature of the air flowing past the Routing Engine.
DRAM	Total DRAM available to the Routing Engine's processor.
Memory utilization	Percentage of Routing Engine memory being used.

Table 93: show chassis routing-engine Output Fields *(continued)*

Field Name	Field Description
CPU utilization	Information about the Routing Engine's CPU utilization: • **User**—Percentage of CPU time being used by user processes. • **Background**—Percentage of CPU time being used by background processes. • **Kernel**—Percentage of CPU time being used by kernel processes. • **Interrupt**—Percentage of CPU time being used by interrupts. • **Idle**—Percentage of CPU time that is idle.
Model	Routing Engine model number.
Serial ID	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
Start time	Time at which the Routing Engine started running.
Uptime	How long the Routing Engine has been running.
Last reboot reason	Reason for last reboot, including: • **power cycle/failure**—Reboot due to the switching off of the power button behind the Routing Engine, not the power button on the chassis. • **watchdog**—Reboot due to a hardware watchdog. • **power-button hard power off**—Reboot due to pressing of the power button. • **misc hardware reason**—Reboot due to miscellaneous hardware reasons. • **thermal shutdown**—Reboot due to the router reaching a critical temperature point at which it is unsafe to continue operations. • **hard disk failure**—Reboot due to a hard disk failure. • **reset from debugger**—Reboot due to reset from the debugger. • **chassis control reset**—Reboot due to a chassis control reset. • **bios auto recovery reset**—Reboot due to a BIOS auto-recovery reset. • **could not be determined**—Reboot due to an undetermined reason. • **Router rebooted after a normal shutdown**—Reboot due to a normal shutdown.
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

show chassis temperature-thresholds

Syntax show chassis temperature-thresholds

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display chassis temperature threshold settings, in degrees Celsius.

Required Privilege Level view

List of Sample Output **show chassis temperature-thresholds on page 655**

Output Fields Table 94 on page 655 lists the output fields for the **show chassis temperature-thresholds** command. Output fields are listed in the approximate order in which they appear.

Table 94: show chassis temperature-thresholds Output Fields

Field name	Field Description
Item	Chassis component. If per FRU per slot thresholds are configured, the components about which information is displayed include the chassis, the Routing Engines, FPCs, and FEBs. If per FRU per slot thresholds are not configured, the components about which information is displayed include the chassis and the Routing Engines.
Fan speed	Temperature threshold settings, in degrees Celsius, for the fans to operate at normal and high speeds. • **Normal**—The fans operate at normal speed if the component is at or below this temperature and all the fans are present and functioning normally. • **High**—The fans operate at high speed if the component has exceeded this temperature or a fan has failed or is missing. An alarm is not triggered until the temperature exceeds the threshold settings for a yellow alarm or a red alarm.
Yellow alarm	Temperature threshold settings, in degrees Celsius, that trigger a yellow alarm. • **Normal**—The temperature that must be exceeded on the component to trigger a yellow alarm when the fans are running at full speed. • **Bad fan**—The temperature that must be exceeded on the component to trigger a yellow alarm when one or more fans have failed or are missing.
Red alarm	Temperature threshold settings, in degrees Celsius, that trigger a red alarm. • **Normal**—The temperature that must be exceeded on the component to trigger a red alarm when the fans are running at full speed. • **Bad fan**—The temperature that must be exceeded on the component to trigger a red alarm when one or more fans have failed or are missing.

<mpls>
<summary>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.

NOTE: The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the **show route forwarding table** command. For more information, see the *Junos OS Routing Protocols and Policies Command Reference*.

Options

none—Display all Packet Forwarding Engine forwarding table information.

inet6—(Optional) Display Packet Forwarding Engine IPv6 routes.

ip—(Optional) Display Packet Forwarding Engine IPv4 routes.

iso —(Optional) Display ISO version routing tables.

mpls—(Optional) Display Packet Forwarding Engine Multiprotocol Label Switching (MPLS) information.

prefix *prefix*—(Optional) IPv4 or IPv6 prefix for which to show table entries.

summary—(Optional) Display summary of Packet Forwarding Engine information.

table <*table-name*> <index *index*> <prefix *prefix*>—(Optional) Display table information. Optionally, specify the table name, index, or prefix.

Required Privilege Level

admin

show pfe statistics ip

Syntax show pfe statistics ip
<icmp | options>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display IPv4 Packet Forwarding Engine statistics.

Options none—Display all IPv4 Packet Forward Engine statistics.

icmp—(Optional) Display Packet Forwarding Engine IP ICMP statistics.

options—(Optional) Display Packet Forwarding Engine IP options statistics.

Required Privilege Level admin

List of Sample Output **show pfe statistics ip icmp on page 664**
show pfe statistics ip options on page 665

Output Fields Table 95 on page 663 lists the output fields for the **show pfe statistics ip** command. Output fields are listed in the approximate order in which they appear.

Table 95: show pfe statistics ip Output Fields

Field Name	Field Description
ICMP Statistics	ICMP statistics, including the following: • **requests**—Number of ICMP notifications sent to the PFE. If a throttler is configured, the number of notifications might not reflect all requests made. (See the **throttled icmps** field description.) • **network unreachables**—When route lookups fail, ICMP packets are sent to the source. These packets are ICMP TypeDestination Unreachable (3) and ICMP Code=Network Unreachable (0). • **ttl expired**—Number of notifications processed as a result of time-to-live (TTL) expiration packets. • **ttl captured**—Number of TTL expired packets sent by PFE interfaces to the Routing Engine. • **redirects**—Number of ICMP errors sent with Type=Redirect (5). • **mtu exceeded**—Number of ICMP errors sent with Type=Source Quench (4). • **icmp/option handoffs**—Number of packets that the PFE hardware requests the PFE software to process.

Table 95: show pfe statistics ip Output Fields *(continued)*

Field Name	Field Description
ICMP errors	ICMP errors, including the following: • **unknown unreachables**—Unknown code (greater than 16) found for an unknown unreachable type ICMP error. • **unsupported ICMP type**—Any ICMP type other than UNREACH, REDIRECT, TIME_EXCEED, and PARAM_PROB. • **unprocessed redirects**—When trying to find the neighbor to send redirects to, the PFE could not find the next-hop information. • **invalid ICMP type**—Any ICMP type other than UNREACH, REDIRECT, TIME_EXCEED, and PARAM_PROB. • **invalid protocol**—An incorrect protocol was detected by the ICMP processor. • **bad input interface if1**—The PFE software cannot map the interface index supplied by the chips to a proper data structure in the microkernel. • **throttled icmps**—Number of requests dropped because of rate limiting by the PFE. • **runts**—Number of packets for which the IP header length is less than the minimum length that is supported.
ICMP Discards	ICMP discard statistics, including the following: • **multicasts**—ICMP packets are not sent for link-layer multicast packets. These are counted as invalid source addresses (not a unicast address or all zeros). • **bad source addresses**—ICMP packets were received from an invalid source address (not a unicast address or all zeros). • **bad dest addresses**—ICMP packets were sent to an invalid destination address (not a unicast address or all zeros). • **IP fragments**—ICMP responses are sent only for the first fragments. The rest do not receive a response. This is the count for ICMP requests that receive no response. • **ICMP errors**—Number of ICMP error packets.

show pfe statistics ip icmp

```
user@host> show pfe statistics ip icmp
ICMP Statistics:
           0 requests
           0 network unreachables
           0 ttl expired
           0 ttl captured
           0 redirects
           0 mtu exceeded
           0 icmp/option handoffs
ICMP Errors:
           0 unknown unreachables
           0 unsupported ICMP type
           0 unprocessed redirects
           0 invalid ICMP type
           0 invalid protocol
           0 bad input interface
           0 throttled icmps
           0 runts
ICMP Discards:
           0 multicasts
           0 bad source addresses
           0 bad dest addresses
           0 IP fragments
```

```
            0 ICMP errors
```

show pfe statistics ip options

```
user@host> show pfe statistics ip options
IP Option Values:
  LSRR/SSRR forwarding enabled
IP Option Statistics:
            0 loose source routes
            0 strict source routes
            0 record routes
       889382 router alerts
            0 other options
IP Option Errors:
            0 runts
            2 bad versions
            0 runt header lengths
            0 giant header lengths
            0 null frames
            0 bad option lengths
            0 duplicate options
            0 bad option pointers
            0 source route frames dropped
          188 frames queued
         1126 frames dropped
```

show pfe terse

Syntax show pfe terse

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Packet Forwarding Engine status information.

Options none—Display brief information about the Packet Forwarding Engine.

Required Privilege Level admin

show system alarms

Syntax show system alarms

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display active system alarms.

Options This command has no options.

Additional Information System alarms are preset. They include a **configuration** alarm that appears when no rescue configuration alarm is set and a **license** alarm that appears when a software feature is configured and no valid license is configured for the feature. For more information about system alarms, see the *Junos OS System Basics Configuration Guide*.

Required Privilege Level admin

List of Sample Output **show system alarms on page 670**

show system alarms

```
user@host> show system alarms
2 alarms currently active
Alarm time                    Class     Description
2005-02-24 17:29:34 UTC       Minor     IPsec VPN tunneling usage requires a
license
2005-02-24 17:29:34 UTC       Minor     Rescue configuration is not sent
```

show system audit

Syntax

show system audit
<root-only>

Syntax (J-EX Series Switch)

show system audit
<all-members>
<local>
<member *member-id*>
<root-only>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the state and checksum values for file systems.

Options

none—Display the state and checksum values for all file systems.

all-members—(J-EX4200 switches only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.

local—(J-EX4200 switches only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

root-only—(Optional) Check only the root (/) file system.

Additional Information

To redirect the output to a file, issue the following command:

ssh *router-name* 'show system audit root-only' > *output-file*

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

Required Privilege Level

show system buffers

Syntax show system buffers

Syntax (J-EX Series Switch)
show system buffers
<all-members>
<local>
<member *member-id*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).

Options none—Show all buffer statistics.

all-members—(J-EX4200 switches only) (Optional) Show buffer statistics for on all members of the Virtual Chassis configuration.

local—(J-EX4200 switches only) (Optional) Show buffer statistics for the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Additional Information A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

Required Privilege Level view

List of Sample Output **show system buffers on page 674**

Output Fields Table 97 on page 674 describes the output fields for the **show system buffers** command. Output fields are listed in the approximate order in which they appear.

Table 97: show system buffers Output Fields

Field Name	Field Description
mbufs in use	Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.
mbufs allocated to packet headers	Number of memory buffers currently holding packet headers
mbufs allocated to control blocks	Number of memory buffers currently holding state for sockets.
mbufs allocated to send data	Number of memory buffers currently holding socket send data.
mbufs allocated to pfe refill data	Number of memory buffers currently holding Packet Forwarding Engine refill data.
mbufs allocated to fxp data	Number of memory buffers currently holding fxp data.
mbufs allocated to socket names and addresses	Number of memory buffers currently holding addresses for sockets.
mbuf clusters in use	Allocation statistics for mbuf clusters.
allocated to network	Total amount of memory in use by the networking and interprocess communication (IPC) code.
requests for memory denied	Number of times a memory allocation request within the IPC and networking code failed.
requests for memory delayed	Number of times a memory allocation request within the IPC and networking code was postponed.
calls to protoocl drain routines	Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.

show system buffers

```
user@host> show system buffers
        853 mbufs in use:
        2 mbufs allocated to packet headers
        37 mbufs allocated to protocol control blocks
        28 mbufs allocated to socket names and addresses
        2 mbufs allocated to socket send data
        400 mbufs allocated to pfe refill data
        384 mbufs allocated to fxp data
784/944 mbuf clusters in use
1994 Kbytes allocated to network (83% in use)
0 requests for memory denied
0 requests for memory delayed
0 calls to protocol drain routines
```

Syntax

show system connections
<extensive>
<all-chassis | all-lcc | lcc *number* | scc>
<inet | inet6>
<show-routing-instances>

Syntax (J-EX Series Switch)

show system connections
<extensive>
<all-members>
<inet | inet6>
<local>
<member *member-id*>
<show-routing-instances>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.

Options

none—Display information about all active IP sockets on the Routing Engine.

extensive—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.

all-members—(J-EX4200 switches only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.

inet | inet6—(Optional) Display IPv4 connections or IPv6 connections, respectively.

local—(J-EX4200 switches only) (Optional) Display system connection activity for the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

show-routing-instances—(Optional) Display routing instances.

show system connections on page 676
show system connections extensive on page 677
show system connections show-routing-instances on page 677

Output Fields

Table 98 on page 676 describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

Table 98: show system connections Output Fields

Field Name	Field Description
Proto	Protocol of the socket: **IP**, **TCP**, or **UDP** for IPv4 or IPv6.
Recv-Q	Number of input packets received by the protocol and waiting to be processed by the application.
Send-Q	Number of output packets sent by the application and waiting to be processed by the protocol.
Local Address	Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.
Foreign Address	Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.
Routing Instance (Displayed only when the **show-routing-instance** option is used.	Routing instances associated with active IP sockets on the Routing Engine.
(state)	For TCP, the protocol state of the socket.

show system core-dumps

Syntax

show system core-dumps
<brief | detail>
<*core-filename*>
<core-file-info>

Syntax (J-EX Series Switch)

show system core-dumps
<all-members>
<brief | detail>
<*core-filename*>
<core-file-info>
<local>
<member *member-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Show core files on all routers or switches running the Junos OS. You can use the **show system core-dumps** command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path/filename.

You can use the option ***core-filename*** and its options **core-file-info**, **brief**, and **detail** to display more information about the specified core-dump files.

Options

none—Display a list of all existing core-dump files.

all-members—(J-EX4200 switches only) (Optional) Display system core files on all members of the Virtual Chassis configuration.

brief—(Optional) View details of binary.

core-file-info—(Optional) Display the stack trace of a core file.

core-filename—(Optional) Name of a specific core file to display.

detail—(Optional) View stack trace with details of binary.

local—(J-EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

Required Privilege Level

view

List of Sample Output

show system core-dumps on page 680
show system core-dumps on page 680

Output Fields Table 99 on page 680 describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

Table 99: show system core-dumps Output Fields

Field Name	Field Description
Permissions	Read/write permissions for the file named.
Links	Number of links to the file.
Owner	Name of the file owner.
Group	Name of the group with file access.
File size	File size in bytes.
Modified	Last file modification date and time.
Path/filename	File path where the file resides and the filename.

show system core-dumps This example shows the command output if core files exist.

```
user@host> show system core-dumps
-rw------- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

show system core-dumps This example shows the command output if core files do not exist.

```
user@host> show system core-dumps
/var/crash/*core*: No such file or directory
/var/tmp/*core*: No such file or directory
/var/crash/kernel.*: No such file or directory
```

show system directory-usage

Syntax

show system directory-usage
<depth *number*>
<*path*>

Syntax (J-EX Series Switch)

show system directory-usage
<all-members>
<depth *number*>
<local>
<member *member-id*>
<*path*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display directory usage information.

Options

none—Display all directory usage information.

all-members—(J-EX4200 switches only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

depth *number*—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

local—(J-EX4200 switches only) (Optional) Display directory information for the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

path—(Optional) Path or root directory to traverse.

Output Fields

Table 100 on page 681 describes the output fields for the **show system directory-usage** command. Output fields are listed in the approximate order in which they appear.

Table 100: show system directory-usage Output Fields

Field Name	Field Description
bytes	Number of bytes used by files in a directory.
directory-name	Name of the directory.

show system processes

Syntax

show system processes
<brief | detail | extensive | summary>
<health (pid *process-identifer* | process-name *process-name*)>
<providers>
<resource-limits (brief | detail) *process-name*>
<wide>

Syntax (J-EX Series Switch)

show system processes
<all-members>
<brief | detail | extensive | summary>
<health (pid *process-identifer* | process-name *process-name*)>
<local>
<member *member-id*>
<providers>
<resource-limits (brief | detail) *process-name*>
<wide>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display information about software processes that are running on the router or switch and that have controlling terminals.

Options

none—Display standard information about system processes.

all-members—(J-EX4200 switches only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.

brief | detail | extensive | summary—(Optional) Display the specified level of detail.

health (pid *process-identifer* | process-name *process-name*)—(Optional) Display process health information.

local—(J-EX4200 switches only) (Optional) Display standard system process information for the local Virtual Chassis member.

member *member-id*—(J-EX4200 switches only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

providers—(Optional) Display provider processes.

resource-limits (brief | detail) *process-name*—(Optional) Display process resource limits.

wide—(Optional) Display process information that might be wider than 80 columns.

Output Fields Table 101 on page 683 describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

Table 101: show system processes Output Fields

Field Name	Field Description	Level of Output
last PID	Last process identifier assigned to the process.	**brief extensive summary**
load averages	Three load averages followed by the current time.	**brief extensive summary**
processes	Number of existing processes and the number of processes in each state (**sleeping, running, starting, zombies**, and **stopped**).	**brief extensive summary**
Mem	Information about physical and virtual memory allocation.	**brief extensive summary**
Swap	Information about physical and virtual memory allocation.	**brief extensive summary**
PID	Process identifier.	**detail extensive summary**
TT	Control terminal name.	none **detail**

Table 101: show system processes Output Fields *(continued)*

Field Name	Field Description	Level of Output
STAT	Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process: • **D**—In disk or other short-term, uninterruptible wait • **I**—Idle (sleeping longer than about 20 seconds) • **R**—Runnable • **S**—Sleeping for less than 20 seconds • **T**—Stopped • **Z**—Dead (zombie) • **+** —The process is in the foreground process group of its control terminal. • **<** —The process has raised CPU scheduling priority. • **>** —The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped. • **A**—The process requested random page replacement. • **E**—The process is trying to exit. • **L**—The process has pages locked in core. • **N**—The process has reduced CPU scheduling priority. • **S**—The process requested first-in, first-out (FIFO) page replacement. • **s**—The process is a session leader. • **V**—The process is temporarily suspended. • **W**—The process is swapped out. • **X**—The process is being traced or debugged.	none **detail**
UID	User identifier.	**detail**
USERNAME	Process owner.	**extensive summary**
PPID	Parent process identifier.	**detail**
CPU	(D)—Short-term CPU usage. (E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.	**detail extensive summary**
RSS	Resident set size.	**detail**
WCHAN	Symbolic name of the wait channel.	**detail**
STARTED	Local time when the process started running.	**detail**
PRI	Current priority of the process. A lower number indicates a higher priority.	**detail extensive summary**
NI or NICE	UNIX "niceness" value. A lower number indicates a higher priority.	**detail extensive summary**
SIZE	Total size of the process (text, data, and stack), in kilobytes.	**extensive summary**

Table 101: show system processes Output Fields *(continued)*

Field Name	Field Description	Level of Output
RES	Current amount of resident memory, in kilobytes.	extensive summary
STATE	Current state of the process (for example, **sleep**, **wait**, **run**, **idle**, **zombie**, or **stop**).	extensive summary
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.	detail extensive summary
WCPU	Weighted CPU usage.	extensive summary
COMMAND	Command that is currently running.	detail extensive summary

PART 11

Virtual Chassis

CHAPTER 43

Virtual Chassis—Overview, Components, and Configurations

Virtual Chassis Overview

The Dell PowerConnect J-Series J-EX4200 Ethernet Switch is the basis for the *Virtual Chassis* flexible, scaling switch solution. You can connect individual J-EX4200 switches together to form one unit and manage the unit as a single chassis, called a Virtual Chassis. Up to ten J-EX4200 switches can be interconnected, providing up to a total of 480 access ports. The available bandwidth increases as you include more members within the Virtual Chassis configuration. See "Understanding the High-Speed Interconnection of the Virtual Chassis Members" on page 702.

This topic describes:

- Global Management of Member Switches in a Virtual Chassis on page 693
- High Availability Through Redundant Routing Engines on page 693
- Adaptability as an Access Switch or Distribution Switch on page 693

Basic Configuration of a Virtual Chassis with Master and Backup Switches

To take advantage of the Virtual Chassis configuration's higher bandwidth capacity and software redundancy features, you need to interconnect at least two J-EX4200 switches in a Virtual Chassis configuration. You can start with a default configuration, composed of two J-EX4200 *member switches* interconnected through the dedicated 64-Gbps *Virtual Chassis ports (VCPs)* on their rear panels. These ports do not have to be configured. They are operational as soon as the member switches are powered on. See "Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet" on page 717 for additional information.

Expanding Configurations—Within a Single Wiring Closet and Across Wiring Closets

As your needs grow, you can easily expand the Virtual Chassis configuration to include more member switches. Within a single wiring closet, simply add member switches by cabling together the dedicated VCPs. For more information about expanding Virtual Chassis configurations within a single wiring closet, see "Example: Expanding a Virtual Chassis Configuration in a Single Wiring Closet" on page 722 and "Example: Setting Up a Multimember Virtual Chassis Access Switch with a Default Configuration" on page 727.

You can also expand a Virtual Chassis configuration beyond a single wiring closet. Interconnect switches located in multiple wiring closets or in multiple data center racks by installing the optional SFP or SFP+ uplink modules and connecting the uplink module ports or by connecting the 1-gigabit network interfaces in a J-EX4200-24F switch. The small form-factor pluggable (SFP) uplink module provides four ports for 1-gigabit transceivers. The SFP+ uplink module provides two ports for 10-gigabit SFP+ transceivers or four ports for 1-gigabit SFP transceivers. To use SFP and SFP+ uplink module ports or J-EX4200-24F network interfaces for interconnecting member switches, you must first explicitly configure them as *Virtual Chassis ports (VCPs)*. This procedure includes configuring these ports of a standalone J-EX4200 switch as VCPs prior to interconnecting the new member switch with the existing Virtual Chassis configuration. See "Example: Configuring a Virtual Chassis Interconnected Across Multiple Wiring Closets" on page 733 for detailed information.

When you are creating a Virtual Chassis configuration with multiple members, you might want to deterministically control the role and member ID assigned to each member switch. You can do this by creating a preprovisioned configuration. See "Example: Configuring a Virtual Chassis Using a Preprovisioned Configuration File" on page 752 for more information.

You can add switches to a preprovisioned configuration by using the autoprovisioning feature to automatically configure the uplink module ports as VCPs on the switches being added. See "Adding a New Switch to an Existing Virtual Chassis Configuration (CLI Procedure)" on page 786 for detailed information.

Global Management of Member Switches in a Virtual Chassis

The interconnected member switches in a Virtual Chassis configuration operate as a single network entity. You run EZSetup only once to specify the identification parameters for the master, and these parameters implicitly apply to all members of the Virtual Chassis configuration. You can view the Virtual Chassis configuration as a single device in the J-Web user interface and apply various device management functions to all members of the Virtual Chassis configuration.

The serial console port and dedicated out-of-band management port that are on the rear panel of the individual switches have global virtual counterparts when the switches are interconnected in a Virtual Chassis configuration. A *virtual console* allows you to connect to the master by connecting a terminal directly to the console port of any member switch. A *virtual management Ethernet (VME)* interface allows you to remotely manage the Virtual Chassis configuration by connecting to the out-of-band management port of any member switch through a single IP address. See “Understanding Global Management of a Virtual Chassis Configuration” on page 699.

High Availability Through Redundant Routing Engines

A Virtual Chassis configuration has a master and a backup, each of which has a Routing Engine. These redundant Routing Engines handle all routing protocol processes and control the Virtual Chassis configuration. See “High Availability Features for J-EX Series Switches Overview” on page 18 for further information on redundant Routing Engines and additional high availability features.

Adaptability as an Access Switch or Distribution Switch

A Virtual Chassis configuration supports a variety of user environments, because it can be composed of different models of J-EX4200 switches, with either 24 or 48 access ports, and with these having either full (24 or 48 ports) or partial (8 ports) Power over Ethernet (PoE) port capabilities. You can select different switch models to support various functions. For example, you might set up one Virtual Chassis access switch configuration composed of the full PoE models to support users sitting in cubicles equipped with PCs and VoIP phones. You could set up another Virtual Chassis configuration with partial PoE models to support the company's internal servers and configure one more Virtual Chassis configuration with partial PoE models to support the company's external servers. Alternatively, the Virtual Chassis configuration can be used as a distribution switch. For this type of deployment, you might select the J-EX4200-24F model to connect the distribution switch to multiple access switches located in different buildings on the campus.

Understanding Virtual Chassis Components

A Virtual Chassis configuration allows you to interconnect two to ten J-EX4200 Ethernet Switches and run them as a single network entity. While it is true that you need at least two interconnected switches to take advantage of Virtual Chassis features, it is also true that any individual J-EX4200 switch has some Virtual Chassis components.

This topic covers:

Virtual Chassis Ports (VCPs)

There are two dedicated Virtual Chassis ports (VCPs) on the rear panel of the J-EX4200 switch that are used exclusively to interconnect J-EX4200 switches in a Virtual Chassis configuration. The interfaces for these dedicated ports are operational by default when the ports are properly cabled. For an example of two J-EX4200 switches interconnected with their dedicated VCPs, see “Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet” on page 717. In addition, you can interconnect the switch with another J-EX4200 switch across a wider distance by installing an optional SFP or SFP+ uplink module in a J-EX4200 switch or by using the network interfaces in a J-EX4200-24F switch. To do this using uplink module ports, you need to install one uplink module in at least one J-EX4200 switch at each end of the link. You must set the uplink module ports or the J-EX4200-24F network interfaces to function as VCPs in order for the interconnected switches to be recognized as members of the same Virtual Chassis configuration. This procedure includes setting the uplink module ports or J-EX4200-24F network ports of a standalone J-EX4200 switch as VCPs prior to interconnecting the new member switch with the existing Virtual Chassis configuration. For an example of J-EX4200 switches interconnected with the uplink ports functioning as VCPs, see “Example: Configuring a Virtual Chassis Interconnected Across Multiple Wiring Closets” on page 733.

You can display the status of both the dedicated VCP interfaces and the uplink ports configured as VCP interfaces with the **show virtual-chassis vc-port** command.

Master Role

The member that functions in the master role:

- Manages the member switches.
- Runs the Junos OS for J-EX Series Switches in a master role.

- Runs the chassis management processes and control protocols.
- Represents all the member switches interconnected within the Virtual Chassis configuration. (The hostname and other properties that you assign to this switch during setup apply to all members of the Virtual Chassis configuration.)

When a J-EX4200 switch is powered on as a standalone switch, it is considered the master member. In a multimember Virtual Chassis configuration, one member functions as the master and a second member functions as the backup:

- In a preprovisioned configuration, one of the two members assigned as **routing-engine** functions as the master member. The selection of which member assigned as **routing-engine** functions as master and which as backup is determined by the software based on the master election algorithm. See “Understanding How the Master in a Virtual Chassis Configuration Is Elected” on page 698.
- In a configuration that is not preprovisioned, the selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

Backup Role

The member that functions in the backup role:

- Maintains a state of readiness to take over the master role if the master fails.
- Runs the Junos OS for J-EX Series switches in a backup role.
- Synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

You must have at least two member switches in a Virtual Chassis configuration in order to have a backup member.

- In a preprovisioned configuration, one of the two members assigned as **routing-engine** functions in the backup role. The selection of which member assigned as **routing-engine** functions as master and which as backup is determined by the software based on the master election algorithm. See “Understanding How the Master in a Virtual Chassis Configuration Is Elected” on page 698.
- In a configuration that is not preprovisioned, the selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

Linecard Role

A member that functions in the linecard role:

- Runs only a subset of the Junos OS for J-EX Series switches.
- Does not run the chassis control protocols.
- Can detect certain error conditions (such as an unplugged cable) on any interfaces that have been configured on it through the master.

A Virtual Chassis configuration must have at least three members in order to include a linecard member.

- In a preprovisioned configuration, you can explicitly configure a member with the **role** of linecard, which makes it ineligible for functioning as a master or backup.
- In a configuration that is not preprovisioned, the members that are not selected as master or backup function as linecard members of the Virtual Chassis configuration. The selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

Member Switch and Member ID

Each physically discrete J-EX4200 switch is a potential member of a Virtual Chassis configuration. When a J-EX4200 switch is powered on, it receives a member ID that is displayed on the front-panel LCD. If the switch is powered on as a standalone switch, its member ID is always **0**. When the switch is interconnected with other J-EX4200 switches in a Virtual Chassis configuration, its member ID (**0** through **9**) is assigned by the master based on various factors, such as the order in which the switch was added to the Virtual Chassis configuration. As each switch is added and powered on, it receives the next available (unused) member ID.

If the Virtual Chassis configuration previously included a member switch and that member was physically disconnected or removed from the Virtual Chassis configuration, its member ID is not available for assignment as part of the standard sequential assignment by the master. For example, you might have a Virtual Chassis configuration composed of member 0, member 2, and member 3, because member 1 was removed. When you add another member switch and power it on, the master assigns it as member 4. However, you can use the **request virtual-chassis renumber** command to explicitly change the member ID of the new member switch to use member ID 1.

The member ID distinguishes the member switches from one another. You use the member ID:

- To assign a mastership priority value to a member switch
- To configure interfaces for a member switch
- To apply some operational commands to a member switch
- To display status or characteristics of a member switch

Mastership Priority

In a configuration that is not preprovisioned, you can designate the role (master, backup, or linecard) that a member switch performs within the Virtual Chassis configuration by configuring its mastership priority (from **1** to **255**). The mastership priority value is the factor with the highest precedence for selecting the master of the Virtual Chassis configuration.

The default value for mastership priority is **128**. When a J-EX4200 switch is powered on, it receives the default mastership priority value. Because it is the only member of the Virtual Chassis configuration, it is also the master. When you interconnect a standalone

switch to an existing Virtual Chassis configuration (which implicitly includes its own master), we recommend that you explicitly configure the mastership priority of the members that you want to function as the master and backup.

We recommend that you specify the same mastership priority value for both the master and backup members.

NOTE: Configuring the same mastership priority value for both the master and backup helps to ensure a smooth transition from master to backup in case the master becomes unavailable. It prevents the old master from preempting control from the backup in situations where the backup has taken control of the Virtual Chassis configuration due to the original master being unavailable.

We also recommend that you configure the highest possible mastership priority value (255) for those two members, because that guarantees that these two members continue to function as the master and backup when other members are added to the Virtual Chassis configuration. Any other members of the Virtual Chassis configuration (members with lower mastership priority) are considered linecard members.

In a preprovisioned configuration, the mastership priority value is assigned by the software, based on the specified role.

Virtual Chassis Identifier (VCID)

All members of a Virtual Chassis configuration share one Virtual Chassis identifier (VCID). This identifier is derived from internal parameters. When you are monitoring a Virtual Chassis configuration, the VCID is displayed in the user interface.

Understanding How the Master in a Virtual Chassis Configuration Is Elected

All switches that are interconnected in a Virtual Chassis configuration are member switches of that Virtual Chassis. Each Virtual Chassis configuration has one member that functions as the *master* and controls the Virtual Chassis configuration.

When a Virtual Chassis configuration boots, the Junos OS for J-EX Series Switches automatically runs a master election algorithm to determine which member switch takes the role of master.

The algorithm that the software uses to determine the master is as follows:

1. Choose the member with the highest user-configured mastership priority (255 is the highest possible value).
2. Choose the member that was master the last time the Virtual Chassis configuration booted.
3. Choose the member that has been included in the Virtual Chassis configuration for the longest period of time. (For this to be a deciding factor, there has to be a minimum time lapse of one minute between the power-ons of the individual interconnected member switches.)
4. Choose the member with the lowest MAC address.

The variations among switch models, such as whether the switch has 48 or 24 ports, do not impact the master election algorithm. To ensure that a specific member is elected as the master:

1. Power on only the switch that you want to configure as master of the Virtual Chassis configuration.
2. Configure the mastership priority of that member to have the highest possible value (255).
3. Continue to configure other members through the master member, as desired.
4. Power on the other members.

Understanding Software Upgrade in a Virtual Chassis Configuration

A Virtual Chassis configuration can be composed of multiple J-EX4200 Ethernet Switches and each member switch is running Junos OS packages. For ease of management, the Virtual Chassis configuration provides flexible methods to upgrade software releases.

A new software release can be upgraded to the entire Virtual Chassis configuration or to a particular member in the Virtual Chassis configuration through a CLI or J-Web command.

A user can add software packages to either a single member of the Virtual Chassis configuration or to all members of the Virtual Chassis configuration at the same time.

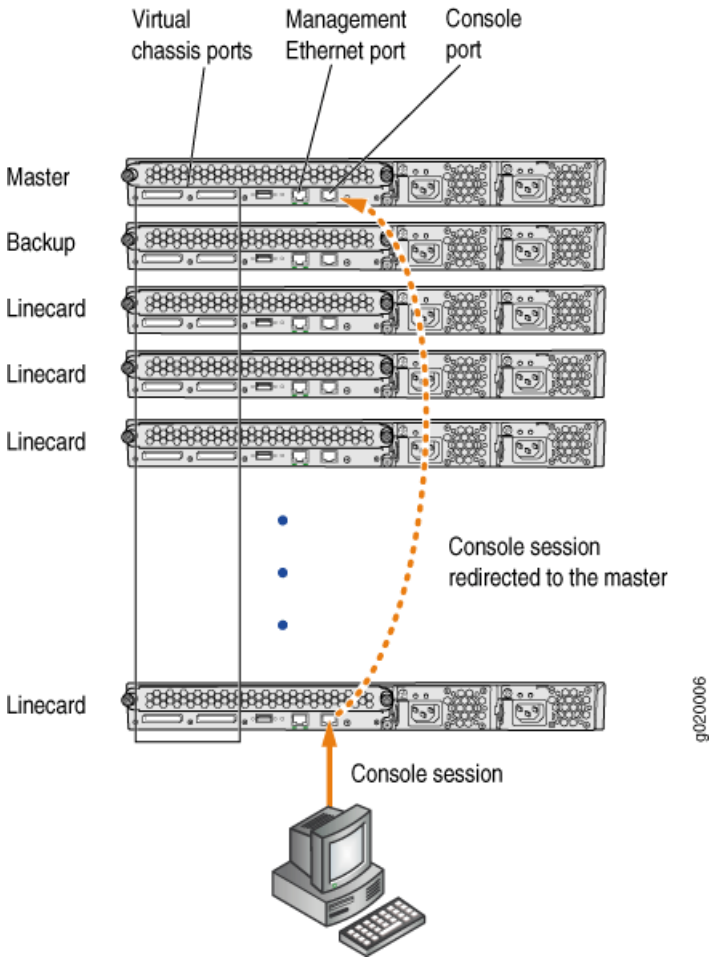
Understanding Global Management of a Virtual Chassis Configuration

A Virtual Chassis configuration is composed of multiple J-EX4200 Ethernet Switches, so it has multiple console ports and multiple out-of-band management Ethernet ports located on the rear panels of the switches.

You can connect a PC or laptop directly to a console port of any member switch to set up and configure the Virtual Chassis. When you connect to the console port of any member switch, the console session is redirected to the master switch, as shown in Figure 7 on page 700.

Figure 7: Console Session Redirection

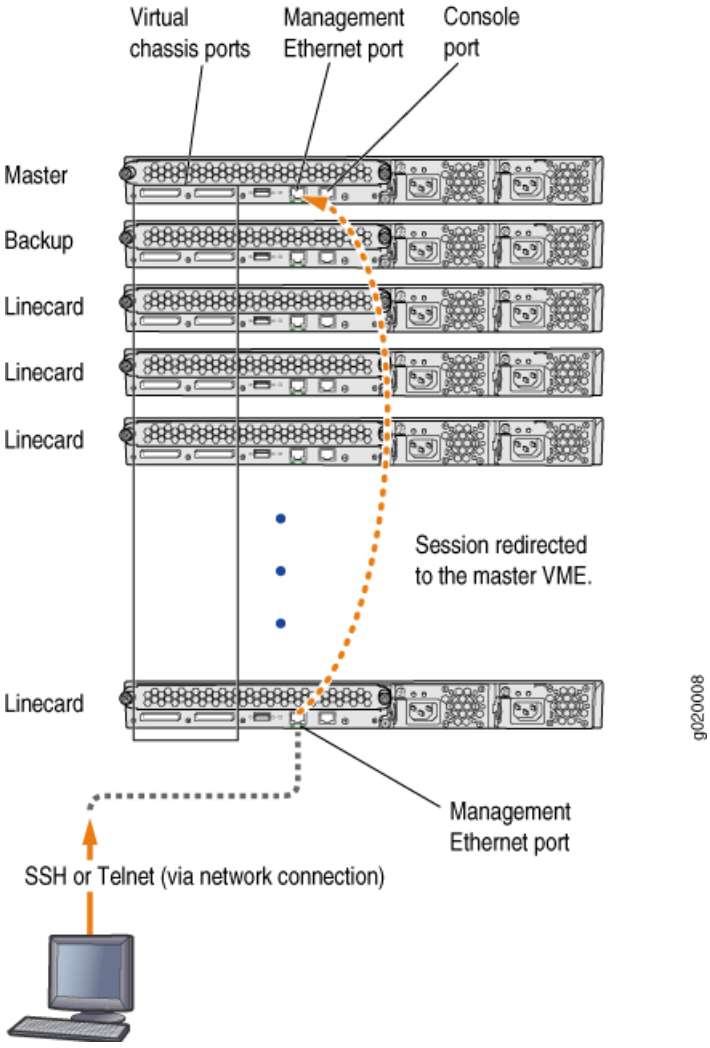


If the master becomes unavailable, the console session is disconnected from the old master and a new session is established with the newly elected master.

An out-of-band management Ethernet port is often referred to simply as a management Ethernet port. It uses a dedicated management channel for device maintenance and allows a system administrator to monitor and manage the switch by remote control.

The Virtual Chassis configuration can be managed remotely through SSH or Telnet using a global management interface called the virtual management Ethernet (VME) interface. VME is a logical interface representing any and all of the out-of-band management ports on the member switches. When you connect to the Virtual Chassis configuration using the VME IP address, the connection is redirected to the master member as shown in Figure 8 on page 701.

Figure 8: Management Ethernet Port Redirection to VME



If the master management Ethernet link is unavailable, the session is redirected through the backup management Ethernet link. If there is no active management Ethernet link on the backup, the VME interface chooses a management Ethernet link on one of the linecard members, selecting the linecard member with the lowest member ID as its first choice.

You can configure an IP address for the VME global management interface at any time.

You can perform remote configuration and administration of all members of the Virtual Chassis configuration through the VME interface.

Understanding Nonvolatile Storage in a Virtual Chassis Configuration

The J-EX4200 Ethernet Switch stores Junos OS system files in internal flash memory. In a Virtual Chassis configuration, both the master and the backup switch store the configuration information for all the member switches.

- Nonvolatile Memory Features on page 702

Nonvolatile Memory Features

The Junos OS for J-EX Series Switches optimizes the way the Virtual Chassis stores its configuration if a member switch or the Virtual Chassis configuration is shut down improperly:

- If the master is not available, the backup switch takes on the role of the master and its internal flash memory takes over as the alternate location for maintaining nonvolatile configuration memory.
- If a member switch is taken offline for repair, the master stores the configuration of the member switch.

Understanding the High-Speed Interconnection of the Virtual Chassis Members

Two high-speed Virtual Chassis ports (VCPs) on the rear panel of the Virtual Chassis member switches enable the members to be interconnected and operate as a single, powerful switch. Each VCP interface is 32 Gbps bidirectional. When VCP interfaces are used to form a ring topology, each segment provides 64 Gbps bidirectional bandwidth. Because the VCP links act as point-to-point links, multiple segments of the ring can be used simultaneously. This allows the Virtual Chassis configuration bandwidth to scale as you interconnect more members within the ring topology.

Understanding Virtual Chassis Configurations and Link Aggregation

You can combine physical Ethernet ports belonging to different member switches of a Virtual Chassis configuration to form a logical point-to-point link, known as a *link aggregation group (LAG)* or *bundle*. A LAG provides more bandwidth than a single Ethernet link can provide. Additionally, link aggregation provides network redundancy by

load-balancing traffic across all available links. If one of the links fails, the system automatically load-balances traffic across all remaining links.

You can select up to four uplink module ports or SFP network ports on a J-EX4200-24F switch that have been configured as Virtual Chassis ports (VCPs) to form a LAG. When you set uplink module ports or SFP network ports on Virtual Chassis member switches as uplink VCPs, connect at least two of those uplink VCPs on one member to at least two uplink VCPs on another member, and configure those uplink VCPs to operate at the same link speed, the uplink VCPs automatically form a LAG and each LAG is assigned a positive-integer identifier called a *trunk ID*.

A LAG over uplink VCPs provides higher overall bandwidth for forwarding traffic between the member switches connected by the uplink VCPs, faster management communications, and greater redundancy of operations among the members than would be available without the LAG. All J-EX4200 Ethernet Switches have two dedicated VCPs. A LAG over uplink VCPs provides an additional Virtual Chassis link throughput of 20 Gbps for the J-EX4200-24T and J-EX4200-48T models and additional throughput of 28 Gbps for the J-EX4200-24F model. Up to eight Virtual Chassis LAGs can be created per member.

See “Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)” on page 792 for information about configuring uplink module ports and SFP network ports on J-EX4200-24F switches as uplink VCPs.

To verify that the LAG has been created, view the output of the command **show virtual-chassis vc-port**.

NOTE: The interfaces that are included within a bundle or LAG are sometimes referred to as *member interfaces*. Do not confuse this term with *member switches*, which refers to J-EX4200 switches that are interconnected as a Virtual Chassis. It is possible to create a LAG that is composed of member interfaces that are located in different member switches of a Virtual Chassis.

Understanding Virtual Chassis Configuration

You configure and manage almost all aspects of a Virtual Chassis configuration through the master of the Virtual Chassis. However, you can also configure Virtual Chassis parameters when a J-EX4200 Ethernet Switch is a standalone switch not interconnected with other members.

A J-EX4200 switch has some innate characteristics of a Virtual Chassis by default. A standalone J-EX4200 switch is assigned member ID **0** and is the master of itself. Therefore, you can edit its Virtual Chassis configuration. When the standalone switch is interconnected with an existing Virtual Chassis configuration, the Virtual Chassis configuration statements and any uplink Virtual Chassis port (VCP) settings that you previously specified on the standalone switch remain part of its configuration.

A switch is not recognized as a member of a Virtual Chassis until it is interconnected with the master or interconnected with an existing member of the Virtual Chassis. When a switch is located too far away to be interconnected through dedicated VCPs, you can specify an uplink module port or a J-EX4200-24F network interface as a VCP by using the **request virtual-chassis vc-port** command. You must issue the **request virtual-chassis vc-port** command on the switch you are adding to the Virtual Chassis as well as on the existing member switch that you will connect to the new member. Because the to-be-added switch is not yet a member, the master switch will not recognize that added switch unless the latter has an uplink VCP. A link aggregation group (LAG) will be formed automatically when the new switch is added to the configuration if more than one such link with the same speed is detected between uplink VCPs on the new member and an existing member. See “Understanding Virtual Chassis Configurations and Link Aggregation” on page 702.

When an uplink module port or a J-EX4200-24F network interface is set as a VCP, it cannot be used for any additional purpose. If you want to use the uplink module port or J-EX4200-24F network interface for another purpose, you can delete the VCP setting by using the **request virtual-chassis vc-port** command. You can execute this command directly on the member whose uplink VCP setting you want to delete or through the master of the Virtual Chassis configuration.

CAUTION: Deleting a VCP in a Virtual Chassis chain configuration can cause the Virtual Chassis configuration to split. For more information, see “Understanding Split and Merge in a Virtual Chassis Configuration” on page 712.

You can create a preprovisioned configuration. This type of configuration allows you to deterministically control the member ID and role assigned to a member switch by associating the switch with its serial number. For an example of a preprovisioned configuration, see “Example: Configuring a Virtual Chassis Using a Preprovisioned Configuration File” on page 752.

NOTE: If a J-EX4200 switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the *slot* element of the interface name.

The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

Understanding Virtual Chassis J-EX4200 Switch Version Compatibility

For J-EX4200 Ethernet Switches to be interconnected as a Virtual Chassis configuration, the switches must be running the same software versions. The master checks the hardware version, the Junos OS version, and other component versions running in a switch that is physically interconnected to its Virtual Chassis port (VCP). Different hardware models can be members of the same Virtual Chassis configuration. However, the master will not assign a member ID to a switch that is running a different software version. A switch that is running a different version of software will not be allowed to join the Virtual Chassis configuration.

Understanding Fast Failover in a Virtual Chassis Configuration

The Virtual Chassis fast failover feature is a hardware-assisted failover mechanism that automatically reroutes traffic and reduces traffic loss in the event of a link failure or switch failure. If a link between two members fails, traffic flow between those members must be rerouted quickly so that there is minimal traffic loss.

Fast failover is effective only for Virtual Chassis members configured in ring topologies using identical port types.

This topic describes the following:

Supported Topologies for Fast Failover

For fast failover to be effective, the Virtual Chassis members must be configured in a ring topology. The ring topology can be formed by using either dedicated Virtual Chassis ports (VCPs) or user-configured uplink module VCPs. Fast failover is supported only in a ring topology that uses identical port types, for example, either a topology that uses all dedicated VCPs or one that uses all uplink module VCPs. Fast failover is not supported in a ring topology that includes both dedicated VCPs and uplink module VCPs. Fast failover is supported, however, in a Virtual Chassis configuration that consists of multiple rings.

How Fast Failover Works

When fast failover is activated, each VCP is automatically configured with a backup port of the same type (dedicated VCP or SFP uplink VCP). If a VCP fails, its backup port is used to send traffic. These backup ports act as standby ports and are not meant for load-balancing purposes.

Fast Failover in a Ring Topology using Dedicated VCPs

When fast failover is activated in a ring topology that uses dedicated VCPs, each VCP is automatically configured with a backup port of the same type. If a VCP fails, its backup port is used to send traffic. Figure 9 on page 707 shows normal traffic flow in a ring topology using dedicated VCPs.

Figure 9: Normal Traffic Flow in a Ring Topology Using Dedicated VCPs

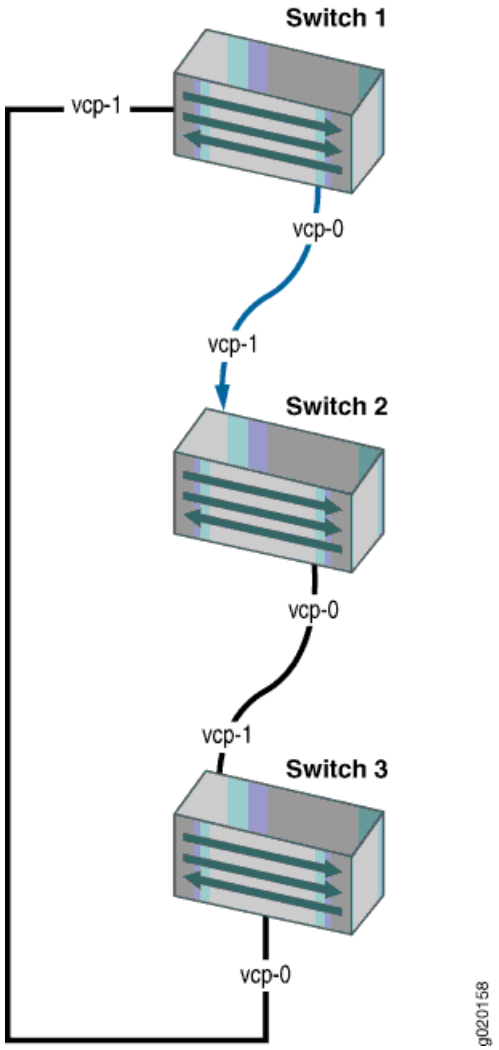

Figure 10 on page 708 shows traffic redirected by fast failover.

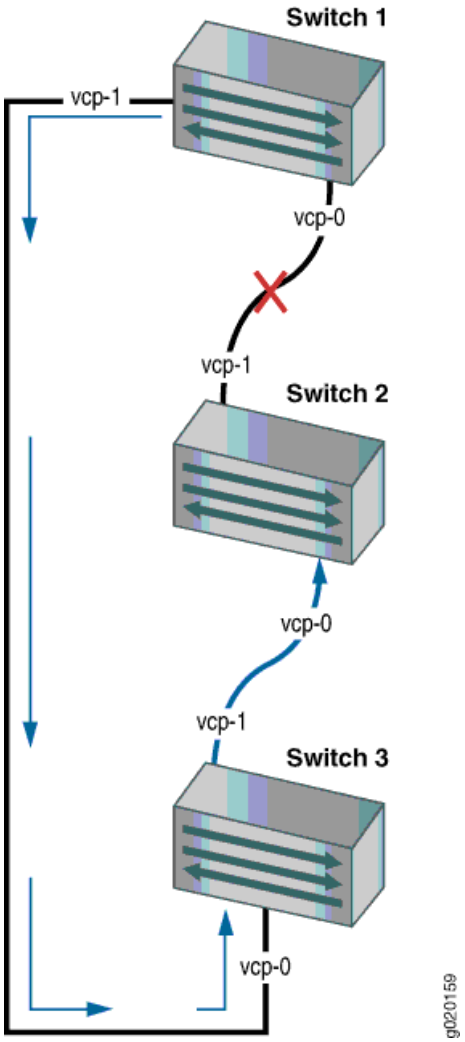
Figure 10: Traffic Redirected by Fast Failover After Dedicated VCP Link Failure



When the failed link is restored, the Virtual Chassis reconfigures the topology to the topology's original state.

Fast Failover in a Ring Topology Using Uplink Module VCPs

In a ring topology that uses uplink module VCPs, each uplink module VCP is automatically configured with a backup uplink module VCP. If an uplink module VCP fails, its backup port is used to send traffic. Figure 11 on page 709 shows normal traffic flow in a ring topology using SFP uplink module VCPs.

NOTE: In order to use SFP uplink module ports as VCPs, you must configure them to be VCPs using the request virtual-chassis vc-port command. Once configured, they will be converted into VCPs. For example xe-0/1/0 will become vcp-255/1/0 after you configure it to be a VCP.

Figure 11: Normal Traffic Flow in a Ring Topology Using SFP Uplink Module VCPs

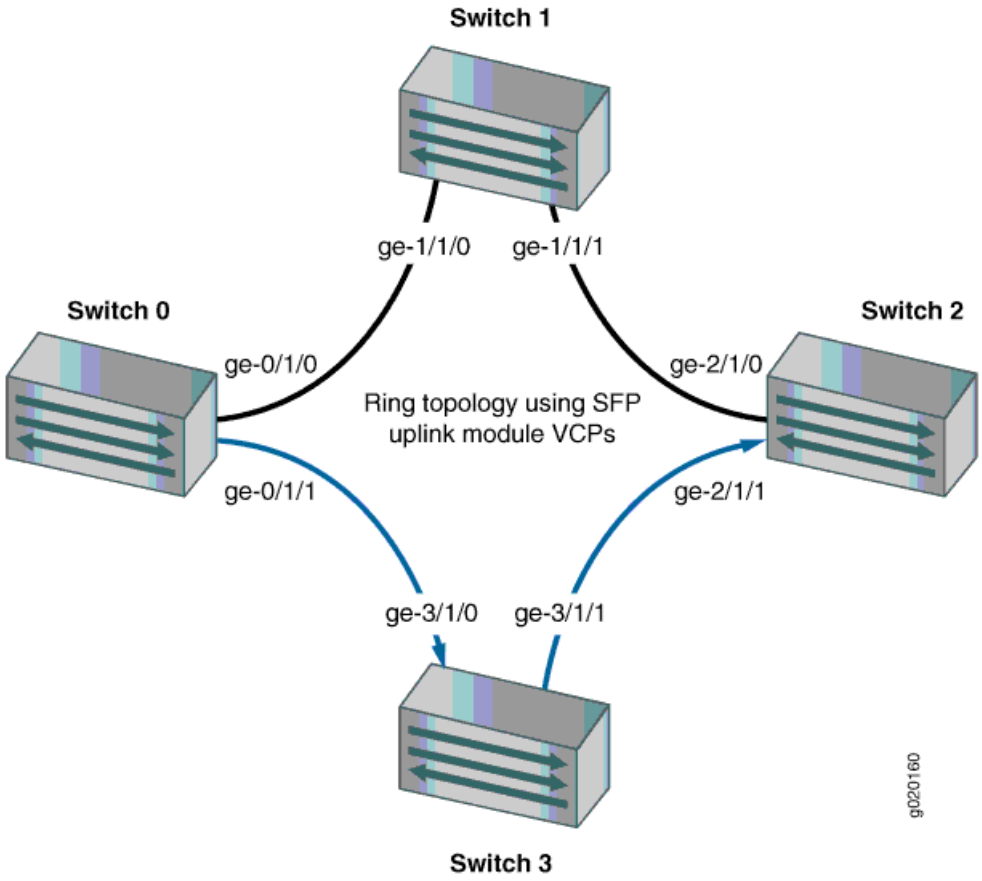


Figure 12 on page 710 shows traffic redirected by fast failover.

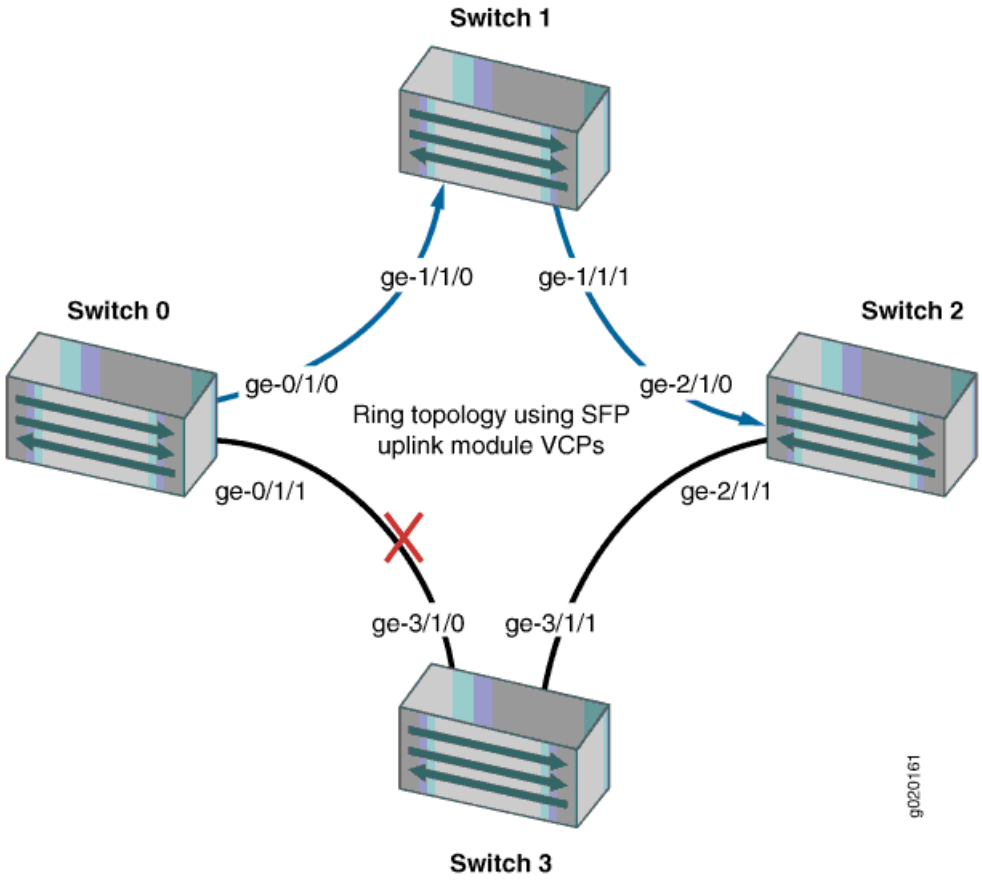
Figure 12: Traffic Redirected by Fast Failover After SFP Uplink Module VCP Link Failure

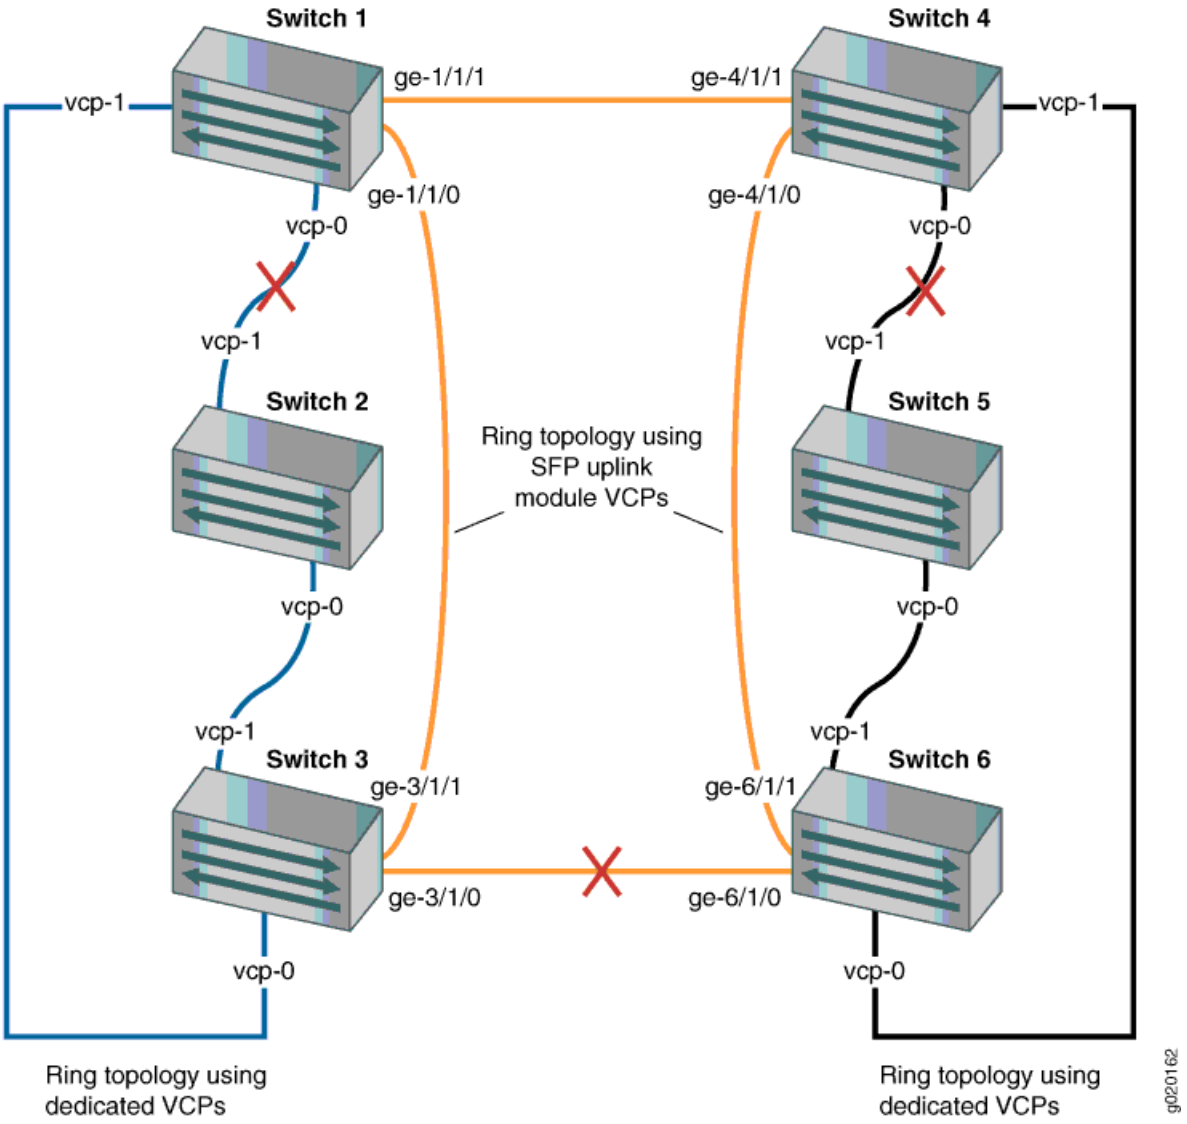


In a ring topology that uses SFP uplink module VCPs, there are four ports per module. Consecutive pair of ports are automatically configured as backup ports for each other. For example, if a Virtual Chassis member has an SFP uplink module installed, uplink module VCPs **ge-0/1/0** and **ge-0/1/1** are automatically configured as the backup port for the other port in the pair. Similarly, ports **ge-0/1/2** and **ge-0/1/3** are automatically configured as the backup port for the other port in the pair.

Fast Failover in a Virtual Chassis Configuration Using Multiple Ring Topologies

Fast failover is supported in a Virtual Chassis configuration with a multiple-ring topology, as shown in Figure 13 on page 711.

Figure 13: Traffic Redirected by Fast Failover After VCP Link Failures in a Topology with Multiple Rings



In this scenario, the Virtual Chassis configuration has three rings: two rings that use dedicated VCPs and one ring that uses SFP uplink module VCPs. Fast failover works independently on each ring. Each dedicated VCP in a ring is backed up by another dedicated VCP. Similarly, each SFP uplink module VCP is backed up by another SFP uplink module VCP. Fast failover does not support a ring topology consisting of a mix of dedicated VCPs and uplink module VCPs.

Effects of Topology Changes on a Fast Failover Configuration

Once the fast failover feature has been activated, topology changes to the Virtual Chassis configuration do not affect the fast failover configuration. In the event of a link or switch failure, fast failover functions normally.

Understanding Split and Merge in a Virtual Chassis Configuration

In a Virtual Chassis configuration, two or more J-EX4200 Ethernet Switches are connected together to form a unit that is managed as a single chassis. If there is a disruption to the Virtual Chassis configuration due to member switches failing or being removed from the configuration, the Virtual Chassis configuration splits into two separate Virtual Chassis. This situation could cause disruptions in the network if the two separate configurations share common resources, such as global IP addresses. The split and merge feature provides a method to prevent the separate Virtual Chassis configurations from adversely affecting the network and also allows the two parts to merge back into a single Virtual Chassis configuration.

NOTE: If a Virtual Chassis configuration splits into separate parts, we recommend that you resolve the problem that caused the Virtual Chassis configuration to split as soon as possible.

You can also use this feature to merge two active but separate Virtual Chassis that have not previously been part of the same configuration into one Virtual Chassis configuration.

NOTE: The split and merge feature is enabled by default on J-EX4200 switches. You can disable the split and merge feature by using the **set virtual-chassis no-split-detection** command.

This topic describes:

- What Happens When a Virtual Chassis Configuration Splits on page 712
- Merging Virtual Chassis Configurations on page 713

What Happens When a Virtual Chassis Configuration Splits

When a Virtual Chassis configuration splits into two separate Virtual Chassis configurations, the individual member switches detect this topology change and run the master election algorithm to select a new master for each of the two Virtual Chassis configurations. The new masters then determine whether their Virtual Chassis configuration remains active. One of the configurations remains active based on the following:

- It contains both the stable master and the stable backup (that is, the master and backup from the original Virtual Chassis configuration before the split).

- It contains the stable master and the configuration is greater than half the Virtual Chassis size.
- It contains the stable backup and is at least half the Virtual Chassis size.

Due to the rules given in the second and third list items, if the Virtual Chassis configuration splits into two equal parts and the stable master and stable backup are in different parts, then the part that contains the stable backup will become active.

NOTE: The number of members in the Virtual Chassis configuration includes all member switches connected to date minus the number whose Virtual Chassis member IDs have been recycled. Therefore, the size of the Virtual Chassis configuration increases when a new member switch is detected and decreases when a member switch's ID is recycled (that is, made available for reassignment).

These rules ensure that only one of the two separate Virtual Chassis configurations created by the split remains active. The member switches in the inactive Virtual Chassis configuration remain in a linecard role. For the inactive members to become active again, one of the following things must happen:

- The problem that caused the original Virtual Chassis configuration to split is resolved, allowing the two Virtual Chassis configurations to merge.
- You load the factory default configuration on the inactive members, which causes the inactive members to function as standalone switches or become part of a different Virtual Chassis configuration.

NOTE: When you remove a member switch from a Virtual Chassis configuration, you should recycle the member ID using the request virtual-chassis recycle command.

Merging Virtual Chassis Configurations

There are two scenarios in which separate Virtual Chassis merge:

- A Virtual Chassis configuration that had split into two is now merging back into a single configuration because the problem that had caused it to split has been resolved.
- You want to merge two Virtual Chassis that had not previously been configured together.

Every Virtual Chassis configuration has a unique ID that is automatically assigned when the Virtual Chassis configuration is formed. You can also explicitly assign a Virtual Chassis ID using the **set virtual-chassis id** command. A Virtual Chassis ID that you assign takes precedence over automatically assigned Virtual Chassis IDs.

When you reconnect the separate Virtual Chassis configurations or connect them for the first time, the members determine whether or not the separate Virtual Chassis

configurations can merge. The members use the following rules to determine whether a merge is possible:

- If the Virtual Chassis configurations have the same Virtual Chassis ID, then the configurations can merge. If the two Virtual Chassis were formed as the result of a split, they will have the same Virtual Chassis ID.
- If the Virtual Chassis IDs are different, then the two configurations can merge only if both are active (inactive configurations cannot merge, ensuring that members removed from one Virtual Chassis configuration do not become members of another Virtual Chassis configuration). If the configurations to merge are both active and one of them has a user-configured Virtual Chassis ID, this ID becomes the ID of the merged Virtual Chassis. If neither Virtual Chassis has a user-configured Virtual Chassis ID, then the Virtual Chassis ID of the configuration with the highest mastership priority becomes the ID of the merged Virtual Chassis. The resulting merged Virtual Chassis configuration will be active.

When you connect two Virtual Chassis configurations, the following events occur:

1. Connecting the two split Virtual Chassis configurations triggers the shortest-path-first (SPF) algorithm. The SPF algorithm computes the network topology and then triggers the master election algorithm. The master election algorithm waits for the members to synchronize the topology information before running.
2. The master election algorithm merges the Virtual Chassis IDs of all the members.
3. Each member runs the master election algorithm to select a master and a backup from among all members with the same Virtual Chassis IDs. For more information, see “Understanding How the Master in a Virtual Chassis Configuration Is Elected” on page 698.
4. The master determines whether the Virtual Chassis configuration is active or inactive. (See “What Happens When a Virtual Chassis Configuration Splits” on page 712.)
5. If the Virtual Chassis configuration is active, the master assigns roles to all members. If the Virtual Chassis configuration is inactive, the master assigns all members the role of linecard.
6. When the other members receive their role from the master, they change their role to backup or linecard. They also use the active or inactive state information sent by the master to set their own state to active or inactive and to construct the Virtual Chassis member list from the information sent by the master.
7. If the Virtual Chassis state is active, the master waits for messages from the members indicating that they have changed their roles to the assigned roles, and then the master changes its own role to master.

NOTE: When you merge two Virtual Chassis that had not previously been part of the same Virtual Chassis configuration, any configuration settings (such as the settings for Telnet/FTP services, GRES, fast failover, VLANs, and so on) that exist on the new master will become the configuration settings for all members of the new Virtual Chassis, overwriting any other configuration settings.

Understanding Automatic Software Update on Virtual Chassis Member Switches

The automatic software update feature automatically updates the Junos OS version on prospective member switches as they are added to a Virtual Chassis configuration of J-EX4200 Ethernet Switches so the new member switch immediately joins the Virtual Chassis configuration and is put in the active state.

For a standalone J-EX4200 switch to join an existing Virtual Chassis configuration, it must be running the same version of Junos OS that is running on the Virtual Chassis master. When the master in a Virtual Chassis configuration detects that a new switch has been added to the configuration, it checks the software version on the new switch. If the software version on the new switch is not the same as the version running on the master, the master keeps the new switch in the inactive state. If you have not enabled the automatic software update feature, you will have to manually install the correct software version on each prospective member switch as it is added to the Virtual Chassis configuration.

CHAPTER 44

Virtual Chassis—Configuration Examples

Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet

A Virtual Chassis configuration is a scalable switch. You can provide secure, redundant network accessibility with a basic two-member Virtual Chassis configuration and later expand the Virtual Chassis configuration to provide additional access ports as your office grows.

This example describes how to configure a Virtual Chassis with a master and backup in a single wiring closet:

Requirements

This example uses the following hardware and software components:

- One J-EX4200-48T switch
- One J-EX4200-24T switch
- One uplink module

Before you begin, be sure you have:

1. Rack-mounted the switches. See Mounting a J-EX4200 Switch on Two Posts in a Rack or Cabinet or Mounting a J-EX4200 Switch on Four Posts in a Rack or Cabinet or Mounting a J-EX4200 Switch on a Desk or Other Level Surface.
2. Installed the uplink module. See Installing an Uplink Module in a J-EX4200 Switch.
3. Cabled the switches. See Connecting a Virtual Chassis Cable to a J-EX4200 Switch.

Overview and Topology

A Virtual Chassis configuration allows you to accommodate the networking needs of a growing office. The default configuration of a two-member Virtual Chassis includes a master and a backup switch. In addition to providing more access ports than a single J-EX4200 switch can provide, a Virtual Chassis configuration provides high availability through redundancy.

This example shows a Virtual Chassis configuration composed of two J-EX4200 switches. One of the switches has an uplink module with ports that can be configured to connect to a distribution switch or customer edge (CE) router or that can be configured as Virtual Chassis ports (VCPs) to interconnect with a member switch that is located too far for the dedicated VCP cabling. (The network interfaces on J-EX4200-24F switches can also be configured as VCPs.) For information on configuring the uplink ports as trunk ports to a distribution switch, see “Configuring Gigabit Ethernet Interfaces (CLI Procedure)” on page 919. For an example of configuring uplink ports as VCPs, see “Example: Configuring a Virtual Chassis Interconnected Across Multiple Wiring Closets” on page 733.

By default, after you interconnect the switches with the dedicated VCPs and power on the switches, the VCPs are operational. The mastership priorities and member IDs are assigned by the software. The software elects a master based on several criteria, including how long a member switch has belonged to the Virtual Chassis configuration. For additional details, see “Understanding How the Master in a Virtual Chassis Configuration

Is Elected" on page 698. Therefore, we recommend that you start by powering on only one member switch, the one that you want to function as the master.

NOTE: We recommend that you use the **commit synchronize** command to save any configuration changes that you make to a multimember Virtual Chassis.

The Virtual Chassis configuration provides networking access for 50 onsite workers, who are sitting within range of a single wiring closet. The workers all use personal computers and VoIP phones. As the office grows, you can add more J-EX4200 switches to meet increased needs for access ports.

The topology for this example consists of two switches, one of which contains an uplink module:

- One J-EX4200-48T switch (SWA-0) with 48 access ports, all of which support PoE
- One J-EX4200-24T switch (SWA-1) with 24 access ports, including eight ports that support PoE
- One uplink module, with two 10-Gigabit Ethernet ports, is installed in SWA-1.

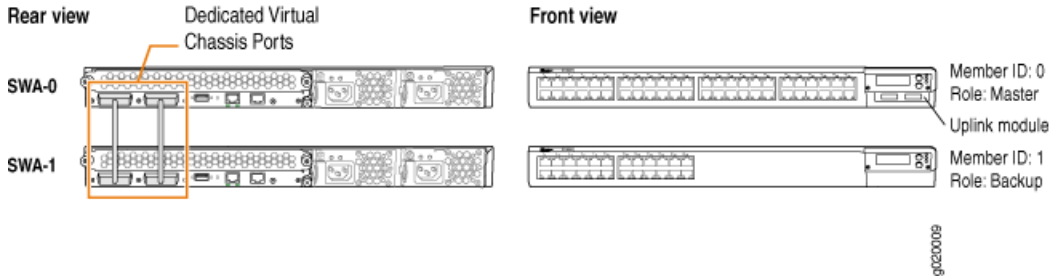
Table 102 on page 719 shows the default configuration settings for the two-member Virtual Chassis.

Table 102: Components of the Basic Virtual Chassis Access Switch Topology

Member Switch	Hardware	Member ID	Role and Priority
SWA-0	J-EX4200-48T switch	0	Master: mastership priority 128
SWA-1	J-EX4200-24T switch	1	Backup: mastership priority 128

Figure 14 on page 719 shows that SWA-0 and SWA-1 are interconnected with their dedicated VCPs on the rear panel. The LCD on the front displays the Member ID and Role. SWA-0 also includes an uplink module. Its uplink ports can be used to connect to a distribution switch.

Figure 14: Basic Virtual Chassis with Master and Backup



Configuration

Configure a Virtual Chassis with a default master and backup in a single wiring closet:

Step-by-Step Procedure

To configure a Virtual Chassis with master and backup:

1. Make sure the VCPs on the rear panel of the member switches are properly cabled. See Virtual Chassis Cabling Configuration Examples for J-EX4200 Switches.
2. Power on SWA-0 (the member switch that you want to function as the master).
3. Check the front-panel LCD to confirm that the switch has powered on correctly.
4. Run the EZ Setup program on SWA-0, specifying the identification parameters. See “Connecting and Configuring a J-EX Series Switch (CLI Procedure)” on page 161 or “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163 for details.
5. Configure SWA-0 with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis configuration, if desired.

   ```
   [edit]
   user@SWA-0# set interfaces vme unit 0 family inet address /ip-address/mask/
   ```

6. Power on SWA-1.

Verification

To confirm that the Virtual Chassis configuration is operational, perform these tasks:

- Verifying That the Mastership Priority Is Assigned Appropriately on page 720
- Verifying That the VCPs Are Operational on page 721

Verifying That the Mastership Priority Is Assigned Appropriately

Purpose Verify that the master, which has been selected by default, is the member switch that you want to function in that role.

Action

1. Check the front-panel LCD to confirm that the switch has powered on correctly and that a member ID has been assigned.
2. List the member switches of the Virtual Chassis configuration.

```
user@SWA-0> show virtual-chassis status

Virtual Chassis ID: 0019.e250.47a0
                                          Mastership            Neighbor List
Member ID  Status   Serial No    Model    priority    Role      ID  Interface
0 (FPC 0)  Prsnt    AK0207360276 ex4200-48t      128  Master*    1  vcp-0
                                                                 1  vcp-1
1 (FPC 1)  Prsnt    AK0207360281 ex4200-24t      128  Backup     0  vcp-0
                                                                 0  vcp-1

Member ID for next new member: 2 (FPC 2)
```

Meaning The **show virtual-chassis status** command lists the member switches interconnected in a Virtual Chassis configuration with the member IDs that have been assigned by the master, the mastership priority values, and the roles. It also displays the neighbor members with which each member is interconnected. The output shows that SWA-0, member 0, has been assigned default mastership priority 128. Because SWA-0 is the first member to be powered on, it has the most seniority and is therefore assigned the role of master. SWA-1 is powered on after member 0, so it is assigned the role of backup. The member IDs are displayed on the front panel of the switches. Check and confirm whether the default assignment is satisfactory.

Verifying That the VCPs Are Operational

Purpose Verify that the dedicated Virtual Chassis ports interconnecting the switches are operational.

Action Display the Virtual Chassis ports of all the members:

```
user@SWA-0> show virtual-chassis vc-port all-members
fpc0:
--------------------------------------------------------------------------
Interface        Type            Status    Speed        Neighbor
or                                         (mbps)     ID   Interface
PIC / Port
vcp-0            Dedicated        Up        32000      1    vcp-1
vcp-1            Dedicated        Up        32000      1    vcp-0

fpc1:
--------------------------------------------------------------------------
Interface        Type            Status    Speed        Neighbor
or                                         (mbps)     ID   Interface
PIC / Port
vcp-0            Dedicated        Up        32000      1    vcp-0
vcp-1            Dedicated        Up        32000      1    vcp-1
```

Meaning The **show virtual-chassis vc-port** command lists the interfaces that are enabled for the member switches of the Virtual Chassis configuration and shows the status of the interfaces. The output in this example shows that two of the VCPs are operational and two VCPs are not. A single cable has been used to interconnect vcp-0 of member ID 0 and vcp-0 of member ID 1. That interconnection is sufficient for the switch to be operational. However, we recommend that you connect the second set of VCPs for redundancy.

Troubleshooting the Virtual Chassis

To troubleshoot the configuration of a Virtual Chassis, perform these tasks:

Troubleshooting the Assignment of Roles

Problem The master and backup roles are not assigned to the member switches that you want to function in these roles.

Solution Modify the mastership priority values.

To quickly modify the mastership priority of SWA-1 (member ID 1), copy the following command and paste it into the switch terminal window:

```
[edit virtual-chassis]
user@SWA-1# set member 1 mastership-priority 255
```

Troubleshooting the VCPs

Problem The VCPs are down.

Solution

1. Check to make sure that you have cabled the appropriate ports.
2. Check to make sure that the cables are seated properly.

You should generally cable and interconnect both of the VCPs on the member switches, for redundancy and high availability.

Related Documentation

- Example: Expanding a Virtual Chassis Configuration in a Single Wiring Closet on page 722
- Example: Setting Up a Multimember Virtual Chassis Access Switch with a Default Configuration on page 727
- Example: Configuring a Virtual Chassis Using a Preprovisioned Configuration File on page 752

- Configuring a Virtual Chassis (J-Web Procedure) on page 784

Example: Expanding a Virtual Chassis Configuration in a Single Wiring Closet

A Virtual Chassis configuration is a scalable switch composed of multiple interconnected J-EX4200 switches. Up to ten J-EX4200 switches can be interconnected as a Virtual Chassis configuration.

This example describes how to configure an expanding Virtual Chassis within a single wiring closet:

Requirements

This example uses the following hardware and software components:

- One J-EX4200-48T switch
- Two J-EX4200-24T switches
- One uplink module

Before you begin, be sure you have:

- Confirmed that the existing Virtual Chassis configuration is operating correctly. See “Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet” on page 717.

Overview and Topology

A Virtual Chassis configuration can be expanded without disrupting the site's network connectivity. This example describes adding a member switch to an existing Virtual Chassis configuration to provide additional access ports for connecting more PCs and VoIP phones at this location. You can continue to expand the Virtual Chassis configuration with additional members in the same wiring closet, using the same procedure. If you want to expand the Virtual Chassis configuration to include member switches in another wiring closet, see “Example: Configuring a Virtual Chassis Interconnected Across Multiple Wiring Closets” on page 733.

If you want to retain the roles of the existing master and backup switches, explicitly configure the mastership priority of these switches, specifying the highest possible value (255) for both the master and the backup.

During expansion, the existing Virtual Chassis configuration can remain powered on and connected to the network. Before powering up the new switch, interconnect it to the other the switches using the dedicated VCPs on the rear panel. Do not run the EZ Setup program on the added member switch.

This example shows an existing Virtual Chassis configuration composed of two J-EX4200 switches. The Virtual Chassis configuration is being expanded to include a J-EX4200-24T switch as a linecard member.

The topology for this example consists of:

- One J-EX4200-48T switch (SWA-0) with 48 access ports, 8 of which support Power over Ethernet (PoE)
- Two J-EX4200-24T switch (SWA-1 and SWA-2) each with 24 access ports, including 8 ports that support PoE
- One uplink module with two 10-gigabit ports is installed in the J-EX4200-48T switch. These ports can be configured as trunk ports to connect to a distribution switch or customer edge (CE) router or as Virtual Chassis ports (VCPs) to interconnect with a member switch that is located too far for dedicated VCP cabling. (The uplink module ports on the SFP and SFP+ uplink modules and the SFP network interfaces on the J-EX4200-24F switches can also be used for these purposes.) For information on configuring the uplink ports as trunk ports to a distribution switch, see “Configuring Gigabit Ethernet Interfaces (CLI Procedure)” on page 919 or “Configuring Gigabit Ethernet Interfaces (J-Web Procedure)” on page 909. For information on configuring uplink ports as Virtual Chassis ports, see “Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)” on page 792.

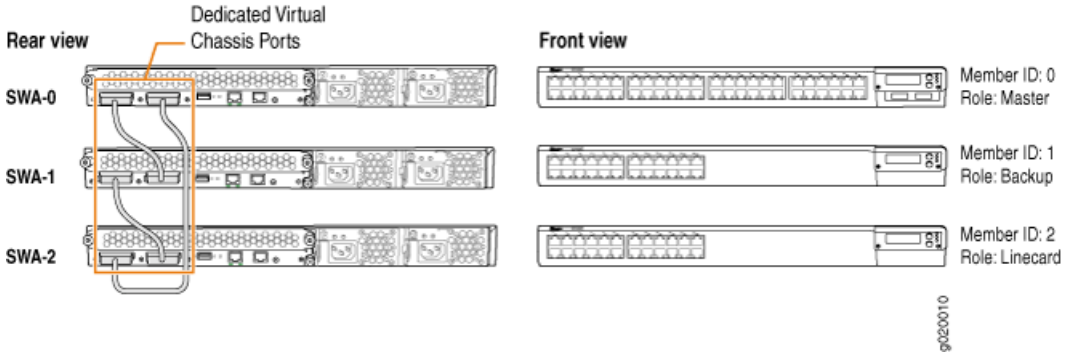
Table 103 on page 724 shows the configuration settings for the expanded Virtual Chassis.

Table 103: Components of the Expanded Virtual Chassis Access Switch

Member Switch	Hardware	Member ID	Role in Virtual Chassis
SWA-0	J-EX4200-48T switch	0	master; mastership priority 255
SWA-1	J-EX4200-24T switch	1	backup; mastership priority 255
SWA-2	J-EX4200-24T switch	2	linecard; mastership priority 128

Figure 15 on page 724 shows that the three member switches (SWA-0, SWA-1 and SWA-2) are interconnected with their dedicated VCPs on the rear panel. The LCD on the front displays the member ID and role. SWA-0 also includes an uplink module. Its uplink ports can be used to connect to a distribution switch.

Figure 15: Expanded Virtual Chassis in Single Wiring Closet



Configuration

To expand a Virtual Chassis configuration to include additional member switches within a single wiring closet, perform these tasks:

NOTE: We recommend that you use the **commit synchronize** command to save any configuration changes that you make to a multimember Virtual Chassis configuration.

CLI Quick Configuration

To maintain the master and backup roles of the existing members and ensure that the new member switch functions in a linecard role, copy the following commands and paste them into the terminal window:

```
[edit]
user@SWA-0# set virtual-chassis member 0 mastership-priority 255
user@SWA-1# set virtual-chassis member 1 mastership-priority 255
```

Step-by-Step Procedure

To ensure that the existing member switches retain their current roles and to add another member switch in a linecard role:

1. Configure the mastership priority of SWA-0 (member 0) to be the highest possible value, thereby ensuring that it functions as the master of the expanded Virtual Chassis configuration.

   ```
   [edit virtual-chassis]
   user@SWA-0# set member 0 mastership-priority 255
   ```

2. Configure the mastership priority of SWA-1 (member 1) to be the highest possible value. This setting is recommended for high availability and smooth transition of mastership in case the original master becomes unavailable.

   ```
   [edit virtual-chassis]
   user@SWA-1# set member 1 mastership-priority 255
   ```

3. Interconnect the unpowered SWA-2 with SWA-0 and SWA-1 using the dedicated VCPs on the rear panel. See Virtual Chassis Cabling Configuration Examples for J-EX4200 Switches for additional information.

4. Power on SWA-2.

   You do not need to configure or run EZ Setup on SWA-2. The identification parameters that were set up for the master apply implicitly to all members of the Virtual Chassis configuration. SWA-2 functions in a linecard role, since SWA-0 and SWA-1 have been configured to the highest mastership priority values.

Verification

To verify that the new switch has been added as a linecard and that its VCPs are operational, perform these tasks:

- Verifying That the New Switch Has Been Added as a Linecard on page 725
- Verifying That the VCPs Are Operational on page 726

Verifying That the New Switch Has Been Added as a Linecard

Purpose Verify that SWA-2 has been added in a linecard role to the Virtual Chassis configuration.

Action Use the **show virtual-chassis status** command to list the member switches with their member IDs, mastership priority values, and assigned roles.

```
user@SWA-0> show virtual-chassis status

Virtual Chassis ID: 0000.e255.00e0

                                          Mastership            Neighbor List
Member ID  Status  Serial No   Model     Priority  Role      ID Interface

0 (FPC 0)  Prsnt   abc123      ex4200-48t    255  Master*    1 vcp-0
                                                             2 vcp-1

1 (FPC 1)  Prsnt   def456      ex4200-24t    255  Backup     2 vcp-0
                                                             0 vcp-1
```

```
2 (FPC 2)  Prsnt   abd231      ex4200-24tp    128  Linecard    0 vcp-0
                                                               1 vcp-1
```

Meaning The **show virtual-chassis status** command lists the member switches of the Virtual Chassis configuration with the member IDs and mastership priority values. It also displays the neighbor members with which each member is interconnected. This output shows that SWA-2 has been assigned member ID 2 and has the default mastership priority value 128. Because the mastership priority is lower than the mastership priority of the other members, SWA-2 functions in the linecard role. You can continue to add more member switches, following the same procedure. It is possible to have multiple members in linecard roles with the same mastership priority value.

Verifying That the VCPs Are Operational

Purpose Verify that the dedicated VCPs interconnecting the member switches are operational.

Action List the VCP interfaces on the Virtual Chassis configuration.

```
user@SWA-0>show virtual-chassis vc-port all-members
fpc0:
--------------------------------------------------------------------------
Interface        Type             Status
or
PIC / Port
vcp-0            Dedicated        Up
vcp-1            Dedicated        Up

fpc1:
--------------------------------------------------------------------------
Interface        Type             Status
or
PIC / Port
vcp-0            Dedicated        Up
vcp-1            Dedicated        Up

fpc2:
--------------------------------------------------------------------------
Interface        Type             Status
or
PIC / Port
vcp-0            Dedicated        Up
vcp-1            Dedicated        Up
```

Meaning The **show virtual-chassis vc-port all-members** command lists all the interfaces for the Virtual Chassis configuration. In this case, no VCP uplinks have been configured. However, the VCP interfaces are automatically configured and enabled when you interconnect member switches using the dedicated Virtual Chassis ports. There are two dedicated VCPs on the rear panel of each J-EX4200 switch. It is recommended that you interconnect the member switches using both VCPs for redundancy. The VCP interfaces are identified simply as **vcp-0** and **vcp-1**. The **fpc** number is the same as the member ID.

Troubleshooting

To troubleshoot the configuration of an expanded Virtual Chassis, perform these tasks:

Troubleshooting Mastership Priority

Problem You want to designate a different member as the master.

Solution Change the mastership priority value or values of the switches, designating the highest mastership priority value for the switch that you want to be master.

1. Lower the mastership priority of the existing master (member 0).

```
[edit virtual-chassis]
user@SWA-0# set member 0 mastership-priority 1
```

2. Set the mastership priority of the member that you want to be the master to the highest possible value (255):

```
[edit virtual-chassis]
user@SWA-2# set member 2 mastership-priority 255
```

Troubleshooting Nonoperational VCPs

Problem The VCP interface shows a status of **down**.

Solution Check the cable to make sure that it is properly and securely connected to the VCPs.

Related Documentation

- Example: Setting Up a Multimember Virtual Chassis Access Switch with a Default Configuration on page 727
- Configuring a Virtual Chassis (CLI Procedure) on page 781
- Configuring a Virtual Chassis (J-Web Procedure) on page 784

Example: Setting Up a Multimember Virtual Chassis Access Switch with a Default Configuration

You can configure a multimember Virtual Chassis access switch in a single wiring closet without setting any parameters—by simply cabling the switches together, using the dedicated Virtual Chassis ports (VCPs). You do not need to modify the default configuration to enable these ports. They are operational by default. The Virtual Chassis configuration automatically assigns the master, backup, and linecard roles, based on the sequence in which the switches are powered on and other factors in the master election algorithm. See “Understanding How the Master in a Virtual Chassis Configuration Is Elected” on page 698.

TIP: We recommend that you explicitly configure the mastership priority of the switches to ensure that the switches continue to perform the desired roles when additional switches are added or other changes occur. However, it is possible to use the default configuration described in this example.

This example describes how to configure a multimember Virtual Chassis in a single wiring closet, using the default role assignments:

Requirements

This example uses the following hardware and software components:

- Two J-EX4200-48T switches
- Four J-EX4200-24T switches

Overview and Topology

A Virtual Chassis configuration is easily expandable. This example shows a Virtual Chassis configuration composed of six J-EX4200 switches. It provides networking access for 180 onsite workers, who are sitting within range of a single wiring closet. The six combined switches are identified by a single host name and managed through a global management IP address.

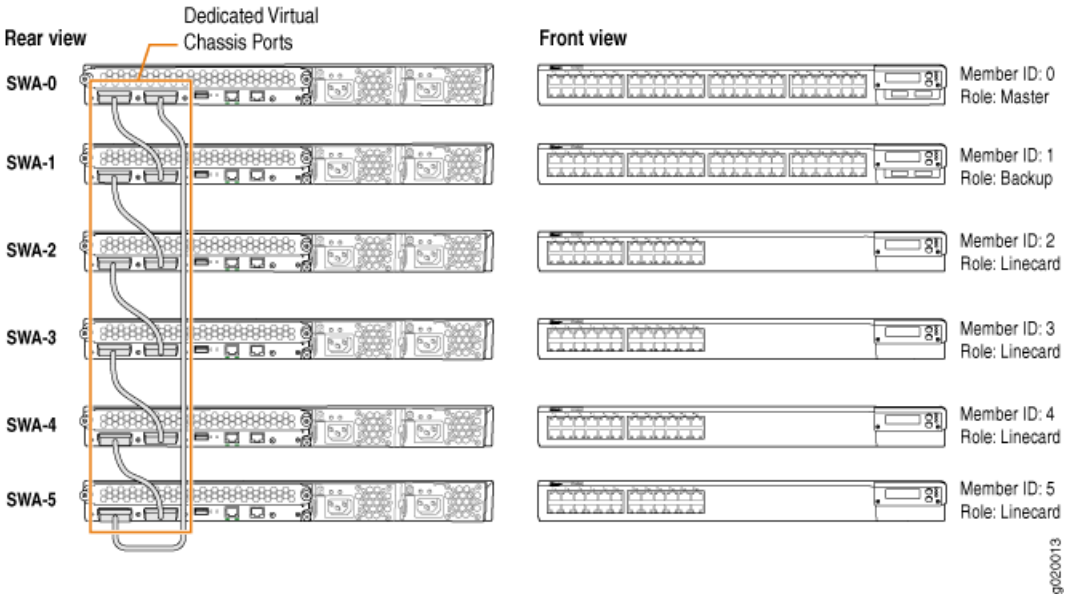
To set up a multimember Virtual Chassis configuration within a single wiring closet, you need to run the EZ Setup program only once. Connect to the master and run EZ Setup to specify its identification, time zone, and network properties. When additional switches are connected through the Virtual Chassis ports (VCPs), they automatically receive the same properties that were specified for the master.

The topology for this example (see Figure 16 on page 729) consists of six switches:

- Two J-EX4200-48T switches (SWA-0 and SWA-1) with 48 access ports, 8 of which support Power over Ethernet (PoE)
- Four J-EX4200-24T switches (SWA-2, SWA-3, SWA-4, and SWA-5) with 24 access ports, 8 of which support PoE

Figure 16 on page 729 shows that all the member switches are interconnected with the dedicated VCPs on the rear panel. The LCD on the front displays the member ID and role.

Figure 16: Default Configuration of Multimember Virtual Chassis in a Single Wiring Closet



Configuration

Configure a multimember Virtual Chassis access switch in a single wiring closet using the factory defaults:

CLI Quick Configuration

By default, after you interconnect the switches with the dedicated VCPs and power on the switches, the VCPs are operational. The mastership priorities and member IDs are assigned by the software. To determine which switch has been selected as the master, check the LCD on the front panel. It should be the first switch that you power on. The backup should be the second switch that you power on. The other switches are all linecards. Wait at least one minute after powering on the master, before continuing to power on the other switches.

Step-by-Step Procedure

To configure a multimember Virtual Chassis with default role assignments:

1. Make sure the dedicated VCPs on the rear panel are properly cabled. See Virtual Chassis Cabling Configuration Examples for J-EX4200 Switches for additional information.
2. Power on the switch that you want to function as the master (SWA-0). This examples uses one of the larger switches (J-EX4200-48T) as the master.
3. Check the front panel LCD to confirm that the switch has powered on correctly and that a member ID has been assigned.
4. Run the EZ Setup program on SWA-0, the master, specifying the identification parameters. See “Connecting and Configuring a J-EX Series Switch (CLI Procedure)” on page 161 or “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163 for details.

5. Configure SWA-0 with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis configuration, if desired.

```
[edit]
user@SWA-0# set interfaces vme unit 0 family inet address /ip-address/mask/
```

6. After a lapse of at least one minute, power on SWA-1. This example uses the second J-EX4200-48T switch as the backup.
7. Check the front panel LCD to confirm that the switch has powered on correctly and that a member ID has been assigned.
8. Power on SWA-2, and check the front panels to make sure that the switch is operating correctly.
9. Continue to power on the member switches one by one, checking the front panels as you proceed.

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the Member IDs and Roles of the Member Switches on page 730
- Verifying That the VCPs Are Operational on page 731

Verifying the Member IDs and Roles of the Member Switches

Purpose Verify that all the interconnected member switches are included within the Virtual Chassis configuration and that their roles are assigned appropriately.

Action Display the members of the Virtual Chassis configuration:

```
user@SWA-0> show virtual-chassis status

Virtual Chassis ID: 0000.e255.00e0

                                          Mastership            Neighbor List
Member ID  Status  Serial No   Model     Priority  Role        ID Interface
0 (FPC 0)  Prsnt   abc123      ex4200-48t    128  Master*     1 vcp-0
                                                              5 vcp-1
1 (FPC 1)  Prsnt   def123      ex4200-48p    128  Backup      2 vcp-0
                                                              0 vcp-1
2 (FPC 2)  Prsnt   abd231      ex4200-24t    128  Linecard    3 vcp-0
                                                              1 vcp-1
3 (FPC 3)  Prsnt   cab123      ex4200-24t    128  Linecard    4 vcp-0
                                                              2 vcp-1
4 (FPC 4)  Prsnt   fed456      ex4200-24t    128  Linecard    5 vcp-0
                                                              3 vcp-1
5 (FPC 5)  Prsnt   jkl231      ex4200-24t    128  Linecard    0 vcp-0
                                                              4 vcp-1
```

Meaning The **show virtual-chassis status** command lists the member switches of the Virtual Chassis configuration with the member IDs and mastership priority values. It also displays the neighbor members with which each member is interconnected. The **fpc** number is the same as the member ID.

Verifying That the VCPs Are Operational

Purpose Verify that the dedicated VCPs interconnecting the member switches are operational.

Action Display the Virtual Chassis interfaces.

```
user@SWA-0> show virtual-chassis vc-port all-members
 fpc0:
--------------------------------------------------------------------------------
Interface        Type             Status
or
PIC / Port
vcp-0            Dedicated        Up
vcp-1            Dedicated        Up

fpc1:
--------------------------------------------------------------------------------
Interface        Type             Status
or
PIC / Port
vcp-0            Dedicated        Up
vcp-1            Dedicated        Up

fpc2:
--------------------------------------------------------------------------------
Interface        Type             Status
or
PIC / Port
vcp-0            Dedicated        Up
vcp-1            Dedicated        Up

fpc3:
--------------------------------------------------------------------------------
Interface        Type             Status
or
PIC / Port
vcp-0            Dedicated        Up
vcp-1            Dedicated        Up

fpc4:
--------------------------------------------------------------------------------
Interface        Type             Status
or
PIC / Port
vcp-0            Dedicated        Up
vcp-1            Dedicated        Up

fpc5:

Interface        Type             Status
or
PIC / Port
```

```
vcp-0           Dedicated       Up
vcp-1           Dedicated       Up
```

Meaning The **show virtual-chassis vc-port all-members** command lists the Virtual Chassis interfaces that are enabled for the member switches of the Virtual Chassis configuration and shows the status of the interfaces. In this case, no VCP uplinks have been configured. However, the VCP interfaces are automatically configured and enabled when you interconnect member switches using the dedicated VCPs. There are two dedicated VCPs on the rear panel of each J-EX4200 switch. The dedicated VCP interfaces are identified simply as vcp-0 and vcp-1. They do not use the standard interface address (in which the member ID is represented by the first digit). The output in this example shows that all interfaces are operational. The **fpc** number is the same as the member ID.

Troubleshooting

To troubleshoot the configuration of a multimember Virtual Chassis in a single wiring closet, perform these tasks:

Troubleshooting Mastership Priority

Problem You want to explicitly designate one member as the master and another as backup.

Solution Change the mastership priority value of the member that you want to function as master, designating the highest mastership priority value that member.

NOTE: These configuration changes are made through the current master, SWA-0.

1. Configure mastership priority of member 0 to be the highest possible value.

```
[edit virtual-chassis]
user@SWA-0# set member 0 mastership-priority 255
```

2. Set the mastership priority of another member that you want to function as the backup member as the same value:

```
[edit virtual-chassis]
user@SWA-0# set member 2 mastership-priority 255
```

Troubleshooting Nonoperational VCPs

Problem The VCP interface shows a status of **down**.

Solution Check the cable to make sure that it is properly and securely connected to the VCPs.

Related Documentation

- Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet on page 717
- Example: Configuring a Virtual Chassis Interconnected Across Multiple Wiring Closets on page 733

Example: Configuring a Virtual Chassis Interconnected Across Multiple Wiring Closets

A Virtual Chassis configuration is a very adaptable access switch solution. You can install member switches in different wiring closets, interconnecting the member switches by cabling and configuring uplink module ports and SFP network ports on J-EX4200-24F switches as Virtual Chassis ports (VCPs).

This example shows how to use uplink VCPs to connect Virtual Chassis members that are located too far apart to be connected using the dedicated VCPs. Uplink VCPs can also be used to connect Virtual Chassis members to form link aggregation groups (LAGs). For the latter usage, see “Example: Configuring Link Aggregation Groups Using Uplink Virtual Chassis Ports” on page 769.

NOTE: You can also configure the SFP networks ports on J-EX4200-24F switches as VCPs to connect Virtual Chassis member switches across wiring closets and to form LAGs.

This example describes how to configure a Virtual Chassis access switch interconnected across wiring closets:

Requirements

This example uses the following hardware and software components:

- Four J-EX4200 switches
- Four uplink modules

Before you interconnect the members of the Virtual Chassis configuration across wiring closets, be sure you have:

1. Installed an uplink module in each member switch. See Installing an Uplink Module in a J-EX4200 Switch.
2. Powered on, connected, and run the EZSetup program on SWA-0 (see Table 104 on page 735 for switch names used in this example). See "Connecting and Configuring a J-EX Series Switch (CLI Procedure)" on page 161 or "Connecting and Configuring a J-EX Series Switch (J-Web Procedure)" on page 163 for details.
3. Configured SWA-0 with the virtual management Ethernet (VME) interface for remote, out-of-band management of the Virtual Chassis configuration, if desired. See "Configuring the Virtual Management Ethernet Interface for Global Management of a Virtual Chassis (CLI Procedure)" on page 797.
4. Interconnected SWA-0 and SWA-1 using the dedicated VCPs on the rear panel. SWA-1 must not be powered on at this time.
5. Interconnected SWA-2 and SWA-3 using the dedicated VCPs on the rear panel. SWA-2 and SWA-3 must not be powered on at this time.

Overview and Topology

In this example, four J-EX4200 switches will be interconnected in a Virtual Chassis configuration. Two of these (SWA-0 and SWA-1) are located in wiring closet A and the two other (SWA-2 and SWA-3) are located in wiring closet B.

For ease of monitoring and manageability, we want to interconnect all four switches as members of a Virtual Chassis configuration. Prior to configuring the Virtual Chassis, we installed uplink modules in each of the member switches. In this example, uplink modules are installed in all four members so that there are redundant VCP connections across the wiring closets. If you want to expand this configuration to include more members within these wiring closets, you do not need to add any more uplink modules. Simply use the dedicated VCPs on the rear panel. The redundancy of uplink VCPs provided in this example is sufficient.

We have interconnected the switches in wiring closet A and also interconnected the ones in wiring closet B using the dedicated VCPs. The interfaces for the dedicated VCPs are operational by default. They do not need to be configured.

However, the Virtual Chassis cables that interconnect the dedicated VCPs of member switches within a single wiring closet are not long enough to connect member switches across wiring closets. Instead, we will use the fiber-optic cable connections in the uplink modules to interconnect the member switches in wiring closet A to the member switches in wiring closet B. You only need to interconnect one member switch in wiring closet A to one in wiring closet B to form the Virtual Chassis configuration. However, for redundancy, this example connects uplink module ports from the two member switches in wiring closet A to the two member switches in wiring closet B.

We will specify the highest mastership priority value (255) for SWA-0 to make it the master before we power on SWA-1. Because SWA-0 and SWA-1 are interconnected with

the dedicated VCPs, the master detects that SWA-1 is a member of its Virtual Chassis configuration and assigns it a member ID.

We configure SWA-2 in wiring closet B without running EZSetup by directly connecting to the console port. If you wish, you can run EZSetup and specify identification parameters. Later, when you interconnect SWA-2 with SWA-0, the master of the Virtual Chassis configuration, the master overwrites any conflicting parameters.

We will use SWA-2 as the backup of the Virtual Chassis configuration. If a problem occurs in wiring closet A, SWA-2 would take control of the Virtual Chassis configuration and maintain the network connections. We will configure the same mastership priority value for SWA-2 (255) that we configured for the master. Because we power on SWA-0 before we power on SWA-2, SWA-0 has additional prioritization properties that allow it to retain mastership of the Virtual Chassis configuration. See “Understanding How the Master in a Virtual Chassis Configuration Is Elected” on page 698. We recommend setting identical mastership priority values for the master and backup members for high availability and smooth transition of mastership in case the original master becomes unavailable. (Setting identical mastership priority values for the master and backup members prevents the previous master from pre-empting the master role from the new master when the previous master comes back online.)

After we have configured SWA-2 and set one of its uplink module ports as an uplink VCP, we will interconnect its uplink VCP with an uplink VCP on SWA-0.

Finally, we will power on SWA-3. Because SWA-3 is interconnected with SWA-2 using the dedicated VCPs on the rear panel, the master will detect that SWA-3 is part of the expanded Virtual Chassis configuration and assign it member ID **3**. For redundancy, we will configure an uplink VCP on SWA-3 through the master and interconnect that uplink VCP with an uplink VCP on SWA-1.

Table 104 on page 735 shows the Virtual Chassis configuration settings for a Virtual Chassis composed of member switches in different wiring closets.

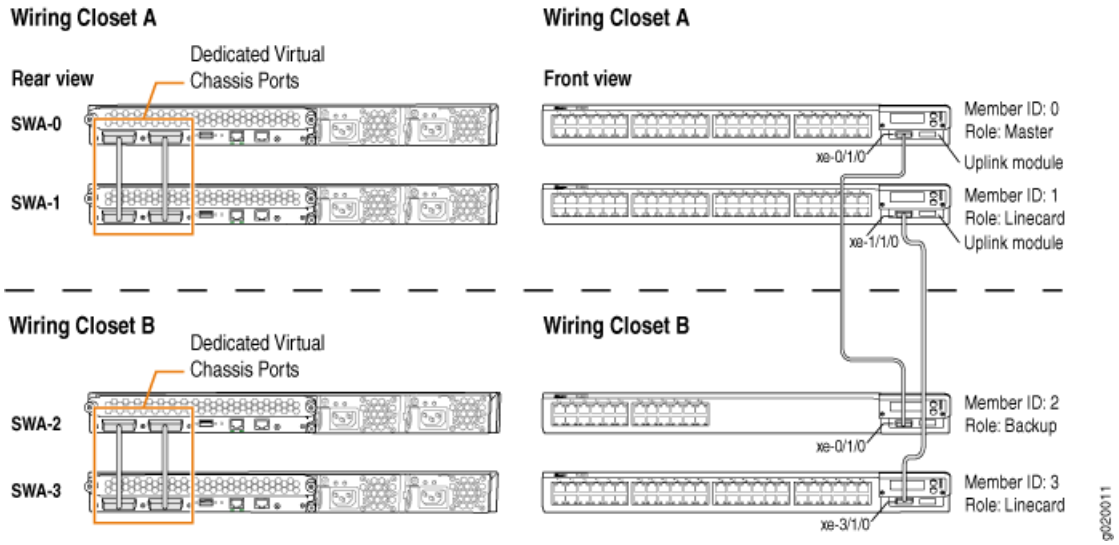
Table 104: Components of a Virtual Chassis Interconnected Across Multiple Wiring Closets

Switch	Member ID	Role and Priority	Location
SWA-0	0	master; mastership priority 255	Wiring closet A
SWA-1	1	linecard; mastership priority 128	Wiring closet A
SWA-2	2	backup; mastership priority 255	Wiring closet B
SWA-3	3	linecard; mastership priority 128	Wiring closet B

Figure 17 on page 736 shows the different types of interconnections used for this Virtual Chassis configuration. The rear view shows the member switches within each wiring

closet interconnected to each other using the dedicated VCPs. The front view shows the uplink VCPs interconnected across the wiring closets.

Figure 17: Virtual Chassis Interconnected Across Wiring Closets



Configuration

To configure the Virtual Chassis across multiple wiring closets, perform these tasks:

Step-by-Step Procedure

To configure a Virtual Chassis across multiple wiring closets:

1. Configure the mastership priority of SWA-0 (member **0**) to be the highest possible value (**255**), thereby ensuring that it functions as the master of the expanded Virtual Chassis configuration:

   ```
   [edit virtual-chassis]
   user@SWA-0# set member 0 mastership-priority 255
   ```

2. Prepare the members in wiring closet A for interconnecting with the member switches in wiring closet B by setting uplink VCPs for member 0 and member 1:

   ```
   user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 0
   user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 0 member 1
   ```

   NOTE:
   - For redundancy, this example configures an uplink VCP in both SWA-0 and SWA-1.
   - This example omits the specification of the member *member-id* option in configuring an uplink VCP for SWA-0 (and, later, for SWA-2). The command applies by default to the switch where it is executed.

3. Prepare SWA-2 in wiring closet B for interconnecting with the Virtual Chassis configuration by configuring its mastership priority to be the highest possible value (255). Its member ID is currently **0**, because it is not yet interconnected with the

other members of the Virtual Chassis configuration. It is operating as a standalone switch. Its member ID will change when it is interconnected.

```
[edit virtual-chassis]
user@SWA-2# set member 0 mastership-priority 255
```

NOTE: SWA-2 is configured with the same mastership priority value that we configured for SWA-0. However, the longer uptime of SWA-0 ensures that, once the interconnection is made, SWA-0 functions as the master and SWA-2 functions as the backup.

4. Specify one uplink module port in SWA-2 as an uplink VCP. Its member ID is **0**, because it is not yet interconnected with the other members of the Virtual Chassis configuration.

NOTE: The setting of the uplink VCP remains intact when SWA-2 reboots and joins the Virtual Chassis configuration as member 2.

```
user@SWA-2> request virtual-chassis vc-port set pic-slot 1 port 0
```

5. Physically interconnect SWA-0 and SWA-2 across wiring closets using their uplink VCPs. Although SWA-0 and SWA-2 have the same mastership priority value (255), SWA-0 was powered on first and thus has longer uptime. This results in SWA-0 retaining mastership while SWA-2 reboots and joins the now expanded Virtual Chassis configuration as the backup, with member ID **2**.

6. Power on SWA-3. It joins the expanded Virtual Chassis configuration as member **3**.

NOTE: Member ID 3 is assigned to SWA-3 is 3, because SWA-3 was powered on after members 0, 1, and 2.

7. Because SWA-3 is now interconnected as a member of the Virtual Chassis configuration, you can specify a redundant uplink VCP on SWA-3 through the master of the Virtual Chassis configuration:

```
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 0 member 3
```

8. Physically interconnect SWA-3 and SWA-1 across wiring closets using their uplink VCPs. Both SWA-1 and SWA-3 have the default mastership priority value (128) and function in a linecard role.

NOTE: We recommend that you use the **commit synchronize** command to save any configuration changes that you make to a multimember Virtual Chassis.

Results Display the results of the configuration on SWA-0:

```
[edit]
user@SWA-0# show virtual-chassis
  member 0 {
    mastership-priority 255;
  }
  member 1 {
    mastership-priority 128;
  }
  member 2 {
    mastership-priority 255;
  }
  member 3 {
    mastership-priority 128;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the Member IDs and Roles of the Member Switches on page 738
- Verifying that the Dedicated VCPs and Uplink VCPs Are Operational on page 739

Verifying the Member IDs and Roles of the Member Switches

Purpose Verify that all the interconnected member switches are included within the Virtual Chassis configuration and that their roles are assigned appropriately.

Action Display the members of the Virtual Chassis configuration:

```
user@SWA-0> show virtual-chassis status

Virtual Chassis ID: 0000.e255.00e0

                                          Mastership            Neighbor List
Member ID  Status  Serial No   Model     Priority  Role        ID Interface

0 (FPC 0)  Prsnt   abc123      ex4200-48t    255   Master*     1 vcp-0
                                                               2 vcp-1
                                                               2 vcp-255/1/0

1 (FPC 1)  Prsnt   def456      ex4200-24t    128   Linecard    0 vcp-0
                                                               0 vcp-1
                                                               3 vcp-255/1/0

2 (FPC 2)  Prsnt   ghi789      ex4200-48t    255   Backup      3 vcp-0

                                                                3 vcp-1
                                                               0 vcp-255/1/0

3 (FPC 3)  Prsnt   jkl012      ex4200-24t    128   Linecard    2 vcp-0
                                                               2 vcp-1
                                                               3 vcp-255/1/0
```

Meaning The **show virtual-chassis status** command lists the member switches interconnected as a Virtual Chassis configuration with the member IDs that have been assigned by the

master, the mastership priority values, and the roles. It also displays the neighbor members with which each member is interconnected.

Verifying that the Dedicated VCPs and Uplink VCPs Are Operational

Purpose Verify that the dedicated VCPs interconnecting member switches in wiring closet A and the uplink VCPs interconnecting the member switches between wiring closets are operational.

Action Display the Virtual Chassis interfaces:

```
user@SWA-0> show virtual-chassis status  all-members

fpc0:
--------------------------------------------------------------------------
Interface   Type              Trunk  Status       Speed        Neighbor
or                             ID                (mbps)       ID  Interface

1/0         Auto-Configured    -1    Up           1000         3   vcp-255/1/0

fpc2:
--------------------------------------------------------------------------
Interface   Type              Trunk  Status       Speed        Neighbor
or                             ID                (mbps)       ID  Interface
PIC / Port
vcp-0       Dedicated           1    Up           32000        3   vcp-0
vcp-1       Dedicated           2    Up           32000
1/0         Auto-Configured    -1    Up           1000         0   vcp-255/1/0

fpc3:
--------------------------------------------------------------------------
Interface   Type              Trunk  Status       Speed        Neighbor
or                             ID                (mbps)       ID  Interface
PIC / Port
vcp-0       Dedicated           1    Up           32000        2   vcp-0
vcp-1       Dedicated           2    Up           32000        2   vcp-1
1/0         Auto-Configured    -1    Up           1000         1   vcp-255/1/0
```

Meaning The dedicated VCPs are displayed as **vcp-0** and **vcp-1**. The interface on the switch that has been set as an uplink VCP is displayed as **1/0**. The member interface names of uplink VCPs are of the form **vcp-255/*pic/port***—for example, **vcp-255/1/0**. In that name, **vcp-255** indicates that the interface is an uplink VCP, **1** is the uplink PIC number, and **0** is the uplink port number. The **fpc** number is the same as the member ID. The **Trunk ID** is a positive

number ID assigned to the LAG formed by the Virtual Chassis. If no LAG is formed, the value is **–1**.

Troubleshooting

To troubleshoot a Virtual Chassis configuration that is interconnected across wiring closets, perform these tasks:

Troubleshooting Nonoperational VCPs

Problem A uplink VCP shows a status of **down**.

Solution

- Check the cable to make sure that it is properly and securely connected to the ports.
- If the VCP is an uplink module port, make sure that it has been explicitly set as an uplink VCP.
- If the VCP is an uplink module port, make sure that you have specified the options (***pic-slot***, ***port***, and ***member***) correctly.

Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch

J-EX Series switches allow you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your J-EX Series switch model. See “Understanding Aggregated Ethernet Interfaces and LACP” on page 867 for more information.

This example describes how to configure uplink LAGs to connect a Virtual Chassis access switch to a Virtual Chassis distribution switch:

- Requirements on page 741
- Overview and Topology on page 741
- Configuration on page 743
- Verification on page 745
- Troubleshooting on page 746

Requirements

This example uses the following software and hardware components:

- Two J-EX4200-48T switches
- Two J-EX4200-24F switches
- Four uplink modules

Before you configure the LAGs, be sure you have:

- Configured the Virtual Chassis switches. See “Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet” on page 717.
- Configured the uplink ports on the switches as trunk ports. See “Configuring Gigabit Ethernet Interfaces (CLI Procedure)” on page 919.

Overview and Topology

For maximum speed and resiliency, you can combine uplinks between an access switch and a distribution switch into LAGs. Using LAGs can be particularly effective when connecting a multimember Virtual Chassis access switch to a multimember Virtual Chassis distribution switch.

The Virtual Chassis access switch in this example is composed of two member switches. Each member switch has an uplink module with two 10-Gigabit Ethernet ports. These ports are configured as trunk ports, connecting the access switch with the distribution switch.

Configuring the uplinks as LAGs has the following advantages:

- Link Aggregation Control Protocol (LACP) can optionally be configured for link negotiation.
- It doubles the speed of each uplink from 10 Gbps to 20 Gbps.
- If one physical port is lost for any reason (a cable is unplugged or a switch port fails, or one member switch is unavailable), the logical port transparently continues to function over the remaining physical port.

The topology used in this example consists of one Virtual Chassis access switch and one Virtual Chassis distribution switch. The access switch is composed of two J-EX4200-48T switches (SWA-0 and SWA-1), interconnected to each other with their Virtual Chassis ports (VCPs) as member switches of Host-A. The distribution switch is composed of two J-EX4200-24F switches (SWD-0 and SWD-1), interconnected with their VCPs as member switches of Host-D.

Each member of the access switch has an uplink module installed. Each uplink module has two ports. The uplinks are configured to act as trunk ports, connecting the access switch with the distribution switch. One uplink port from SWA-0 and one uplink port from SWA-1 are combined as LAG **ae0** to SWD-0. This link is used for one VLAN. The remaining uplink ports from SWA-0 and from SWA-1 are combined as a second LAG connection (**ae1**) to SWD-1. LAG **ae1** is used for another VLAN.

NOTE: If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

Figure 18: Topology for LAGs Connecting a Virtual Chassis Access Switch to a Virtual Chassis Distribution Switch

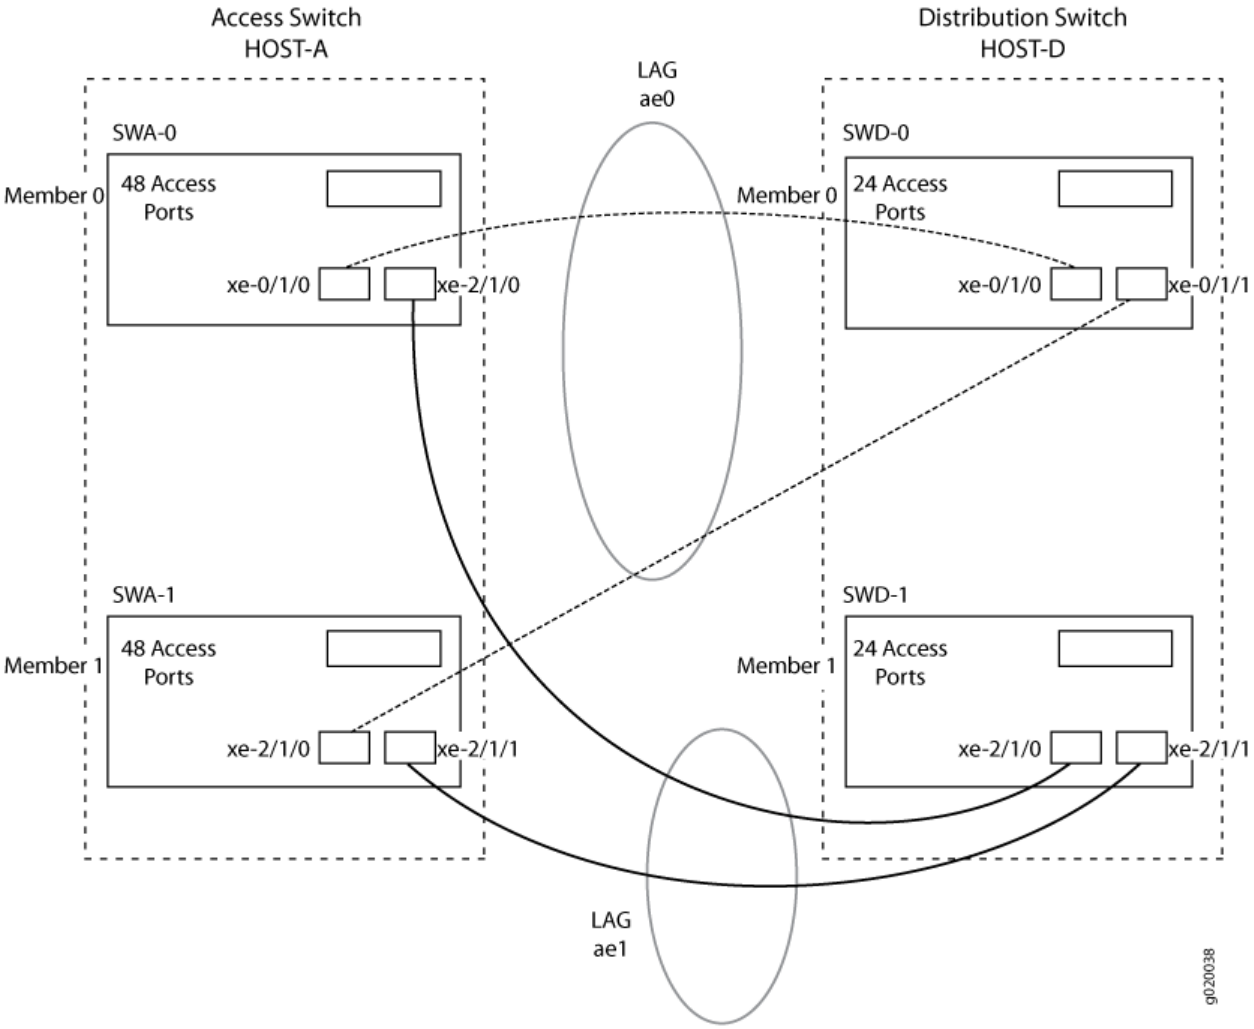

Table 105 on page 743 details the topology used in this configuration example.

Table 105: Components of the Topology for Connecting Virtual Chassis Access Switches to a Virtual Chassis Distribution Switch

Switch	Hostname and VCID	Base Hardware	Uplink Module	Member ID	Trunk Port
SWA-0	Host-A Access switch VCID 1	J-EX4200-48T switch	One uplink module	0	**ge-0/1/0** to SWD-0 **ge-0/1/1** to SWD-1
SWA-1	Host-A Access switch VCID 1	J-EX4200-48T switch	One uplink module	1	**ge-1/1/0** to SWD-0 **ge-1/1/1** to SWD-1
SWD-0	Host-D Distribution switch VCID 4	J-EX4200 L-24F switch	One uplink module	0	**ge-0/1/0** to SWA-0 **ge-0/1/1** to SWA-1
SWD-1	Host-D Distribution switch VCID 4	J-EX4200 L-24F switch	One uplink module	1	**ge-1/1/0** to SWA-0 **xge-1/1/1** to SWA-1

Configuration

To configure two uplink LAGs from the Virtual Chassis access switch to the Virtual Chassis distribution switch:

CLI Quick Configuration

To quickly configure aggregated Ethernet high-speed uplinks between a Virtual Chassis access switch and a Virtual Chassis distribution switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set chassis aggregated-devices ethernet device-count 2
set interfaces ae0 aggregated-ether-options minimum-links 2
set interfaces ae0 aggregated-ether-options link-speed 10g
set interfaces ae1 aggregated-ether-options minimum-links 2
set interfaces ae1 aggregated-ether-options link-speed 10g
set interfaces ae0 unit 0 family inet address 192.0.2.0/25
set interfaces ae1 unit 1 family inet address 192.0.2.128/25
set interfaces ge-0/1/0 ether-options 802.ad ae0
set interfaces ge-1/1/0 ether-options 802.ad ae0
set interfaces ge-0/1/1 ether-options 802.ad ae1
set interfaces ge-1/1/1 ether-options 802.ad ae1
```

Step-by-Step Procedure

To configure aggregated Ethernet high-speed uplinks between a Virtual Chassis access switch and a Virtual Chassis distribution switch:

1. Specify the number of LAGs to be created on the chassis:

   ```
   [edit chassis]
   user@Host-A# set aggregated-devices ethernet device-count 2
   ```

2. Specify the number of links that need to be present for the **ae0** LAG interface to be **up**:

```
[edit interfaces]
user@Host-A# set ae0 aggregated-ether-options minimum-links 2
```

3. Specify the number of links that need to be present for the **ae1** LAG interface to be **up**:

```
[edit interfaces]
user@Host-A# set ae1 aggregated-ether-options minimum-links 2
```

4. Specify the media speed of the **ae0** link:

```
[edit interfaces]
user@Host-A# set ae0 aggregated-ether-options link-speed 10g
```

5. Specify the media speed of the **ae1** link:

```
[edit interfaces]
user@Host-A# set ae1 aggregated-ether-options link-speed 10g
```

6. Specify the interface ID of the uplinks to be included in LAG **ae0**:

```
[edit interfaces]
user@Host-A# set ge-0/1/0 ether-options 802.ad ae0
user@Host-A# set ge-1/1/0 ether-options 802.ad ae0
```

7. Specify the interface ID of the uplinks to be included in LAG **ae1**:

```
[edit interfaces]
user@Host-A# set ge-0/1/1 ether-options 802.ad ae1
user@Host-A# set ge1/1/1 ether-options 802.ad ae1
```

8. Specify that LAG **ae0** belongs to the subnet for the employee broadcast domain:

```
[edit interfaces]
user@Host-A# set ae0 unit 0 family inet address 192.0.2.0/25
```

9. Specify that LAG **ae1** belongs to the subnet for the guest broadcast domain:

```
[edit interfaces]
user@Host-A# set ae1 unit 1 family inet address 192.0.2.128/25
```

Results Display the results of the configuration:

```
[edit]
chassis {
  aggregated-devices {
    ethernet {
      device-count 2;
    }
  }
}
interfaces {
  ae0 {
    aggregated-ether-options {
      link-speed 10g;
      minimum-links 2;
    }
    unit 0 {
      family inet {
        address 192.0.2.0/25;
```

```
        }
      }
    }
    ae1 {
      aggregated-ether-options {
        link-speed 10g;
        minimum-links 2;
      }

        family inet {
          address 192.0.2.128/25;
        }
      }
    ge–0/1/0 {
      ether-options {
        802.ad ae0;
      }
    }
    ge–1/1/0 {
      ether-options {
        802.ad ae0;
      }
    }
    ge–0/1/1 {
      ether-options {
        802.ad ae1;
      }
    }
    gxe–1/1/1 {
      ether-options {
        802.ad ae1;
      }
    }
  }
```

Verification

To verify that switching is operational and two LAGs have been created, perform these tasks:

- Verifying That LAG ae0 Has Been Created on page 745
- Verifying That LAG ae1 Has Been Created on page 746

Verifying That LAG ae0 Has Been Created

Purpose Verify that LAG **ae0** has been created on the switch.

Action **show interfaces ae0 terse**

```
Interface               Admin      Link Proto      Local              Remote

ae0                      up       up
ae0.0                    up       up     inet     10.10.10.2/24
```

Meaning The output confirms that the **ae0** link is up and shows the **family** and IP address assigned to this link.

Verifying That LAG ae1 Has Been Created

Purpose Verify that LAG **ae1** has been created on the switch

Action **show interfaces ae1 terse**

```
Interface               Admin Link Proto    Local                 Remote
ae1                     up    down
ae1.0                   up    down inet
```

Meaning The output shows that the **ae1** link is down.

Troubleshooting

Troubleshooting a LAG That Is Down

Problem The **show interfaces terse** command shows that the LAG is **down:**

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch (or the same Virtual Chassis).

Example: Configuring Aggregated Ethernet High-Speed Uplinks with LACP Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch

J-EX Series switches allow you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your J-EX Series switch model. See “Understanding Aggregated Ethernet Interfaces and LACP” on page 867 for more

information. J-EX Series switches allow you to further enhance these links by configuring Link Aggregation Control Protocol (LACP).

This example describes how to overlay LACP on the LAG configurations that were created in "Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch" on page 740:

Requirements

This example uses the following software and hardware components:

- Two J-EX4200-48T switches
- Two J-EX4200-24F switches
- Four J-EX Series uplink modules

Before you configure LACP, be sure you have:

- Set up the Virtual Chassis switches. See "Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet" on page 717.
- Configured the uplink ports on the switches as trunk ports. See "Configuring Gigabit Ethernet Interfaces (CLI Procedure)" on page 919.
- Configured the LAGs. See "Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch" on page 740

Overview and Topology

This example assumes that you are already familiar with the Example: Configuring Aggregated Ethernet High-Speed Uplinks between Virtual Chassis Access Switch and Virtual Chassis Distribution Switch. The topology in this example is exactly the same as the topology in that other example. This example shows how to use LACP to enhance the LAG functionality.

LACP exchanges are made between *actors* (the transmitting link) and *partners* (the receiving link). The LACP *mode* can be either active or passive.

NOTE: If the actor and partner are both in passive mode, they do not exchange LACP packets, which results in the aggregated Ethernet links not coming up. By default, LACP is in passive mode. To initiate transmission of LACP packets and responses to LACP packets, you must enable LACP in active mode.

By default, the actor and partner send LACP packets every second. You can configure the interval at which the interfaces send LACP packets by including the periodic statement at the **[edit interfaces *interface-name* aggregated-ether-options lacp]** hierarchy level.

The interval can be fast (every second) or slow (every 30 seconds).

Configuring LACP for the LAGs on the Virtual Chassis Access Switch

To configure LACP for the access switch LAGs, perform these tasks:

CLI Quick Configuration

To quickly configure LACP for the access switch LAGs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ae0 aggregated-ether-options lacp active periodic fast
set interfaces ae1 aggregated-ether-options lacp active periodic fast
```

Step-by-Step Procedure

To configure LACP for Host-A LAGs **ae0** and **ae1**:

1. Specify the aggregated Ethernet options for both bundles:

```
[edit interfaces]
user@Host-A#set ae0 aggregated-ether-options lacp active periodic fast
user@Host-A#set ae1 aggregated-ether-options lacp active periodic fast
```

Results

Display the results of the configuration:

```
[edit interfaces]
user@Host-A# show
ae0 {
  aggregated-ether-options {
    lacp {
      active;
      periodic fast;
    }
  }
}
ae1 {
  aggregated-ether-options {
    lacp {
      active;
      periodic fast;
    }
  }
}
```

Configuring LACP for the LAGs on the Virtual Chassis Distribution Switch

To configure LACP for the two uplink LAGs from the Virtual Chassis access switch to the Virtual Chassis distribution switch, perform these tasks:

CLI Quick Configuration

To quickly configure LACP for the distribution switch LAGs, copy the following commands and paste them into the switch terminal window:

```
[edit interfaces]
set ae0 aggregated-ether-options lacp passive periodic fast
set ae1 aggregated-ether-options lacp passive periodic fast
```

Step-by-Step Procedure

To configure LACP for Host D LAGs **ae0** and **ae1**:

1. Specify the aggregated Ethernet options for both bundles:

```
[edit interfaces]
user@Host-D#set ae0 aggregated-ether-options lacp passive periodic fast
user@Host-D#set ae1 aggregated-ether-options lacp passive periodic fast
```

Results

Display the results of the configuration:

```
[edit interfaces]
user@Host-D# show
ae0 {
  aggregated-ether-options {
    lacp {
      passive;
      periodic fast;
    }
  }
}
ae1 {
  aggregated-ether-options {
    lacp {
      passive
      periodic fast;
    }
  }
}
```

Verification

To verify that LACP packets are being exchanged, perform these tasks:

- Verifying the LACP Settings on page 749
- Verifying That the LACP Packets Are Being Exchanged on page 750

Verifying the LACP Settings

Purpose Verify that LACP has been set up correctly.

Action Use the **show lacp interfaces *interface-name*** command to check that LACP has been enabled as active on one end.

```
user@Host-A> show lacp interfaces xe-0/1/0

Aggregated interface: ae0

    LACP state:       Role   Exp   Def  Dist  Col  Syn  Aggr  Timeout  Activity

      ge-0/1/0      Actor    No   Yes    No   No   No   Yes     Fast    Active

      ge-0/1/0    Partner    No   Yes    No   No   No   Yes     Fast   Passive

    LACP protocol:   Receive State    Transmit State          Mux State

      ge-0/1/0          Defaulted     Fast periodic           Detached
```

Meaning The output indicates that LACP has been set up correctly and is active at one end.

Verifying That the LACP Packets Are Being Exchanged

Purpose Verify that LACP packets are being exchanged.

Action Use the **show interfaces ae*x* statistics** command to display LACP information.

```
user@Host-A> show interfaces ae0 statistics

Physical interface: ae0, Enabled, Physical link is Down
  Interface index: 153, SNMP ifIndex: 30
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1,
  Minimum bandwidth needed: 0
  Device flags   : Present Running
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  Current address: 02:19:e2:50:45:e0, Hardware address: 02:19:e2:50:45:e0
  Last flapped   : Never
  Statistics last cleared: Never
    Input packets : 0
    Output packets: 0
  Input errors: 0, Output errors: 0

  Logical interface ae0.0 (Index 71) (SNMP ifIndex 34)
    Flags: Hardware-Down Device-Down SNMP-Traps Encapsulation: ENET2
    Statistics        Packets        pps         Bytes          bps
    Bundle:
        Input :             0          0             0            0
        Output:             0          0             0            0
    Protocol inet
      Flags: None
      Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
        Destination: 10.10.10/24, Local: 10.10.10.1, Broadcast: 10.10.10.255
```

Meaning The output here shows that the link is down and that no PDUs are being exchanged.

Troubleshooting

These are some tips for troubleshooting:

Troubleshooting a Nonworking LACP Link

Problem The LACP link is not working.

Solution Check the following:

- Remove the LACP configuration and verify whether the static LAG is up.
- Verify that LACP is configured at both ends.

- Verify that LACP is not passive at both ends.
- Verify whether LACP protocol data units (PDUs) are being exchanged by running the **monitor traffic-interface** ***lag-member*** **detail** command.

Related Documentation

- Virtual Chassis Cabling Configuration Examples for J-EX4200 Switches
- Installing an Uplink Module in a J-EX4200 Switch

Example: Configuring a Virtual Chassis Using a Preprovisioned Configuration File

You can deterministically control both the role and the member ID assigned to each member switch in a Virtual Chassis configuration by creating a preprovisioned configuration file.

A preprovisioned configuration file links the serial number of each J-EX4200 switch in the configuration to a specified member ID and role. The serial number must be specified in the configuration file for the member to be recognized as part of the Virtual Chassis configuration.

You must select two members that you want to make eligible for election as master of the Virtual Chassis configuration. When you list these two members in the preprovisioned configuration file, you designate both members as **routing-engine**. One will function as the master of the Virtual Chassis configuration and the other will function as the backup.

You designate additional members, which are not eligible for election as master, has having the **linecard** role in the preprovisioned configuration file.

NOTE: When you use a preprovisioned configuration, you cannot modify the mastership priority or member ID of member switches through the user interfaces.

NOTE: After you have created a preprovisioned Virtual Chassis configuration, you can use the autoprovisioning feature to add member switches to that configuration. See “Adding a New Switch to an Existing Virtual Chassis Configuration (CLI Procedure)” on page 786.

This example describes how to configure a Virtual Chassis across multiple wiring closets using a preprovisioned configuration file:

Requirements

This example uses the following hardware and software components:

- Five J-EX4200-48T switches
- Five J-EX4200-24T switches
- Four uplink modules

Before you create the preprovisioned configuration of the Virtual Chassis and interconnect the members across the wiring closets, be sure you have:

1. Made a list of the serial numbers of all the switches to be connected as a Virtual Chassis configuration.
2. Noted the desired role (**routing-engine** or **linecard**) of each switch. If you configure the member with a **routing-engine** role, it is eligible to function as a master or backup. If you configure the member with a **linecard** role , it is not eligible to become a master or backup.
3. Installed an uplink module in each of the member switches that will be interconnected across wiring closets. See Installing an Uplink Module in a J-EX4200 Switch.
4. Interconnected the member switches within each wiring closet using the dedicated VCPs on the rear panel of switches. See Connecting a Virtual Chassis Cable to a J-EX4200 Switch.
5. Powered on the switch that you plan to use as the master switch (SWA-0).
6. Run the EZSetup program on SWA-0, specifying the identification parameters. See “Connecting and Configuring a J-EX Series Switch (CLI Procedure)” on page 161 for details.

   SWA-0 is going to be configured in the example to function as the master of the Virtual Chassis configuration. Thus, the properties that you specify for SWA-0 will apply to the entire Virtual Chassis configuration, including all the member switches that you specify in the preprovisioned configuration file.
7. Configured SWA-0 with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis configuration, if desired.

   ```
   [edit]
   user@SWA-0# set interfaces vme unit 0 family inet address /ip-address/mask/
   ```

Overview and Topology

In this example, five J-EX4200 switches (SWA-0 through SWA-4) are interconnected with their dedicated VCPs in wiring closet A and five J-EX4200 switches (SWA-5 through SWA-9) are interconnected with their dedicated VCPs in wiring closet B.

SWA-0 (in wiring closet A) is going to be the master of the Virtual Chassis configuration. This example shows how to create a preprovisioned configuration file on SWA-0 for all member switches that will be interconnected in the Virtual Chassis configuration. The preprovisioned configuration file includes member IDs for the members in wiring closet A and for the members in wiring closet B.

SWA-5 (in wiring closet B) is going to be the backup of the Virtual Chassis configuration. Both SWA-0 and SWA-5 are specified in the preprovisioned configuration file with the role of **routing-engine**. All other members are specified with the role of **linecard**.

If all member switches could be interconnected with their dedicated VCPs, you could simply power on the switches after saving and committing the preprovisioned configuration file. The master detects the connection of the members through the

dedicated VCPs and applies the parameters specified in the preprovisioned configuration file.

However, the Virtual Chassis cables that interconnect the VCPs of member switches within a single wiring closet are not long enough to connect member switches across wiring closets. Instead, you can configure the uplink module ports and the SFP networks ports on J-EX4200-24F switches as VCPs to interconnect the member switches in wiring closet A to the member switch in wiring closet B. For redundancy, this example connects uplink VCPs from two member switches in wiring closet A (SWA–0 and SWA–2) to two member switches (SWA-5 and SWA-7) in wiring closet B.

NOTE: You can use interfaces on SFP and SFP+ uplink modules and the SFP network ports on J-EX4200-24F switches as VCPs. When an uplink module port or SFP network port is set as a VCP, it cannot be used for any other purpose. The SFP uplink module has four 1-Gbps ports; the SFP+ uplink module has four 1-Gbps or two 10-Gbps ports. The uplink module ports that are not set as VCPs can be configured as trunk ports to connect to a distribution switch.

Because this particular preprovisioned configuration is for a Virtual Chassis that is interconnected across wiring closets, we will bring up the Virtual Chassis configuration in stages. First, we power on SWA-0 (without powering on any other switches) and create the preprovisioned configuration file. Then we power on the remaining switches in wiring closet A. If we check the status of the Virtual Chassis configuration at this point by using the **show virtual-chassis status** command, it will display only **member 0** through **member 4**. The members that have not yet been interconnected will not be listed.

Next power on SWA-5 without powering on the remaining switches (SWA-6 through SWA-9) in wiring closet B. Bring up SWA-5 as a standalone switch and set one of its uplinks as a VCP prior to interconnecting it with the Virtual Chassis configuration in wiring closet A. Without this setting, SWA-5 cannot be detected as a member switch by the master of the Virtual Chassis configuration.

You can set the uplink VCP of SWA–5 without running the EZSetup program by directly connecting to the console port. If you wish, you can run the EZSetup program and specify identification parameters. When you interconnect SWA-5 with the master of the Virtual Chassis configuration, the master overwrites any conflicting parameters.

After setting the VCP in SWA-5, connect this VCP with the VCP of SWA-0 in wiring closet A. SWA-5 (serial number pqr678) is specified as a **routing-engine** in the preprovisioned configuration file.

This example uses SWA-5 as the backup of the Virtual Chassis configuration. If a problem occurred in wiring closet A, SWA-5 would take control of the Virtual Chassis configuration and maintain the network connections. Specify both SWA-0 and SWA-5 as **routing-engine**. Because SWA-0 is powered on prior to SWA-5, it has additional prioritization properties that cause it to be elected as master of the Virtual Chassis configuration.

After being physically interconnected with SWA-0, SWA-5 reboots and comes up as **member 5** and as the backup of the Virtual Chassis configuration.

Power on the remaining switches (SWA-6 through SWA-9) in wiring closet B. The master can now detect that all members are present. Finally, for redundancy, configure an additional VCP on SWA-7 through the master.

The topology for this example consists of:

- Three J-EX4200-48T switches (SWA-0 , SWA-2, and SWA-4) in wiring closet A.
- Two J-EX4200-48T switches (SWA-5 and SWA-9) in wiring closet B.
- Two J-EX4200-24T switches (SWA-1 and SWA-3) in wiring closet A.
- Three J-EX4200-24T switches (SWA-6, SWA-7, and SWA-8) in wiring closet B.
- Four uplink modules. Two are installed in wiring closet A and two are installed in wiring closet B.

Table 106 on page 755 shows the Virtual Chassis configuration settings for a preprovisioned Virtual Chassis composed of member switches in different wiring closets.

Table 106: Components of a Preprovisioned Virtual Chassis Interconnected Across Multiple Wiring Closets

Switch	Serial number	Member ID	Role	Uplink Module Ports	Hardware	Location
SWA-0	abc123	0	routing-engine	**ge-0/1/0**	J-EX4200-48T and uplink module	Wiring closet A
SWA-1	def456	1	linecard		J-EX4200-24T	Wiring closet A
SWA-2	ghi789	2	linecard	**ge-2/1/0**	J-EX4200-48T and uplink module	Wiring closet A
SWA-3	jkl012	3	linecard		J-EX4200-24T	Wiring closet A
SWA-4	mno345	4	linecard		J-EX4200-48T	Wiring closet A
SWA-5	pqr678	5	routing-engine	**ge-0/1/0** NOTE: The member ID of SWA-5 is **0** at the time that its uplink module port is configured as a VCP.	J-EX4200-48T and uplink module	Wiring closet B
SWA-6	stu901	6	linecard		J-EX4200-24T	Wiring closet B

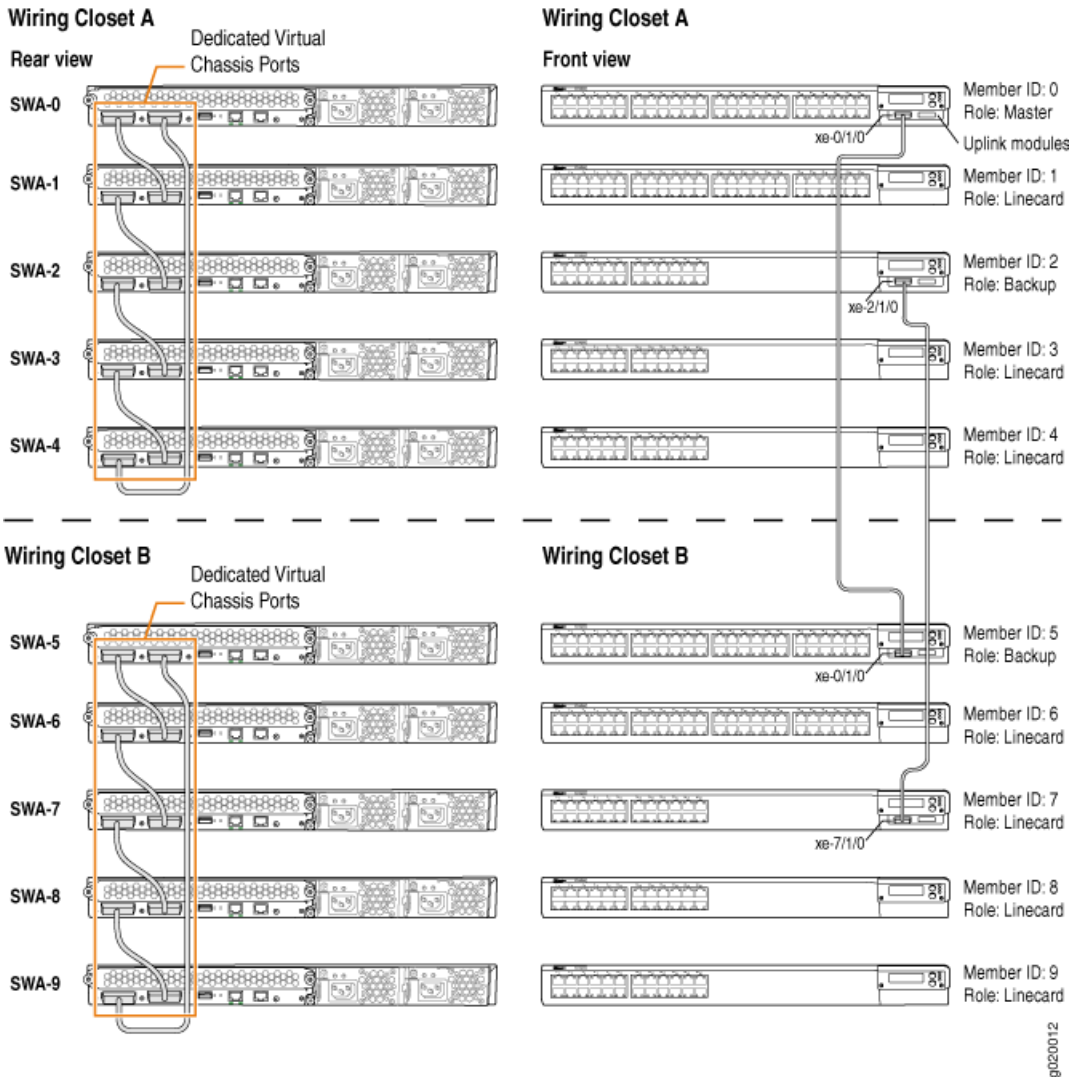
Table 106: Components of a Preprovisioned Virtual Chassis Interconnected Across Multiple Wiring Closets *(continued)*

Switch	Serial number	Member ID	Role	Uplink Module Ports	Hardware	Location
SWA-7	vwx234	7	linecard	**ge-7/1/0**	J-EX4200-24T and uplink module	Wiring closet B
SWA-8	yza567	8	linecard		J-EX4200-24T	Wiring closet B
SWA-9	bcd890	9	linecard		J-EX4200-48T	Wiring closet B

Figure 19 on page 757 shows the different types of interconnections used for this Virtual Chassis configuration. The rear view shows that the member switches within each wiring closet are interconnected to each other using the dedicated VCPs. The front view shows that the uplink module ports that have been set as VCPs and interconnected across the wiring closets. The uplink module ports that are not set as VCPs can be configured as trunk ports to connect to a distribution switch.

NOTE: The interconnections shown in Figure 19 on page 757 are the same as they would be for a configuration that was not preprovisioned across wiring closets.

Figure 19: Maximum Size Virtual Chassis Interconnected Across Wiring Closets



Configuration

To configure the Virtual Chassis across multiple wiring closets using a preprovisioned configuration:

NOTE: We recommend that you use the commit synchronize command to save any configuration changes that you make to a multimember Virtual Chassis configuration.

Step-by-Step Procedure

To create a preprovisioned configuration for the Virtual Chassis:

1. Specify the preprovisioned configuration mode:

```
[edit virtual-chassis]
user@SWA-0# set preprovisioned
```

2. Specify all the members that will be included in the Virtual Chassis configuration, listing each switch's serial number with the desired member ID and the desired role:

```
[edit virtual-chassis]
user@SWA-0# set member 0 serial-number abc123 role routing-engine
user@SWA-0# set member 1 serial-number def456 role linecard
user@SWA-0# set member 2 serial-number ghi789 role linecard
user@SWA-0# set member 3 serial-number jkl012 role linecard
user@SWA-0# set member 4 serial-number mno345 role linecard
user@SWA-0# set member 5 serial-number pqr678 role routing-engine
user@SWA-0# set member 6 serial-number stu901 role linecard
user@SWA-0# set member 7 serial-number vwx234 role linecard
user@SWA-0# set member 8 serial-number yza567 role linecard
user@SWA-0# set member 9 serial-number bcd890 role linecard
```

3. Power on the member switches in wiring closet A.

4. Prepare the members in wiring closet A for interconnecting with the member switches in wiring closet B by setting uplink VCPs for member 0 and member 2:

```
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 0
user@SWA-2> request virtual-chassis vc-port set pic-slot 1 port 0 member 2
```

NOTE:

- For redundancy, this example sets an uplink VCP in both SWA-0 and SWA-2.
- This example omits the specification of the member 0 in setting the uplink for SWA-0. The command applies by default to the switch where it is executed.

5. Power on SWA-5 and connect to it. This switch comes up as member ID **0** and functions as master of itself. Although SWA-5 is listed in the preprovisioned configuration file, it is not a present member of the Virtual Chassis configuration that has been powered on thus far. In order for the master to detect SWA-5 as a connected member, you must first set an uplink VCP on SWA-5 and interconnect that VCP with the uplink VCP of SWA-0.

6. Set the first uplink of SWA-5 to function as a VCP. Because SWA-5 has been powered on as a separate switch and is still operating independently at this point, its member ID is **0**.

```
user@SWA-5> request virtual-chassis vc-port set pic-slot 1 port 0
```

NOTE: This example omits the specification of the member 0 in configuring the uplink for SWA-5 (at this point the member ID of SWA-5 is still 0). The command applies by default to the switch where it is executed.

7. Power off SWA-5 and connect the fiber cable from SWA-5 uplink VCP **ge-0/1/0** to the uplink VCP **ge-0/1/0** on SWA-0.
8. Power on SWA-5.
9. Now that SWA-5 has been brought up as **member 5** of the Virtual Chassis configuration, power on the remaining switches (SWA-6 through SWA-9) in wiring closet B. They are interconnected with SWA-5 using the dedicated VCPs on the rear panel and are therefore detected by the master as interconnected members. If you check the status of the Virtual Chassis configuration at this point, all the members that were specified in the preprovisioned configuration file should be displayed as present. Additional configuration for member switches can now be done through the master switch.
10. Set one uplink module port of SWA-7 to function as a VCP:

```
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 0
member 7
```

Results Display the results of the configuration on SWA-0:

```
[edit]
user@SWA-0# show
virtual-chassis {
  member 0 {
    role routing-engine;
    serial-number abc123;
  }
  member 1 {
    role linecard;
    serial-number def456;
  }
  member 2 {
    role linecard;
    serial-number ghi789;
  }
  member 3 {
    role linecard;
    serial-number jkl012;
  }
  member 4 {
    role linecard;
    serial-number mno345;
  }
  member 5 {
    role routing-engine;
    serial-number pqr678;
  }
```

```
    member 6 {
      role linecard;
      serial-number stu901;
    }
    member 7 {
      role linecard;
      serial-number vwx234;
    }
    member 8 {
      role linecard;
      serial-number yza567;
    }
    member 9 {
      role linecard;
      serial-number bcd890;
    }
    preprovisioned;
  }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the Member IDs and Roles of the Member Switches on page 760
- Verifying That the Dedicated VCPs and Uplink VCPs Are Operational on page 761

Verifying the Member IDs and Roles of the Member Switches

Purpose Verify that the member IDs and roles are all set as expected.

Action Display the members of the Virtual Chassis configuration:

```
user@SWA-0> show virtual-chassis status
Preprovisioned Virtual Chassis
Virtual Chassis ID: 0000.e255.0000
                                                Mastership          Neighbor List
Member ID  Status   Serial No    Model         Priority  Role      ID  Interface

0 (FPC 0)  Prsnt    abc123       ex4200-48t      129  Master*    1  vcp-0
                                                                  4  vcp-1
                                                                  5  1/0

                                                                    8  vcp-1
```

Meaning The output shows that all members listed in the preprovisioned configuration file are connected to the Virtual Chassis configuration. It confirms that SWA-0 (member **0**) is functioning as the master of the Virtual Chassis configuration, which was the intention of the configuration procedure. The other switch configured with the **routing-engine** role (SWA-5) is functioning as the backup. The **Neighbor List** displays the interconnections of the member VCPs.

Verifying That the Dedicated VCPs and Uplink VCPs Are Operational

Purpose Verify that the dedicated VCPs interconnecting the member switches within each wiring closet and the uplink module VCPs interconnecting the member switches across wiring closets are operational.

Action Display the Virtual Chassis interfaces:

```
user@SWA-0> show virtual-chassis vc-port all-members
fpc0:

vcp-1            Dedicated       Up

fpc9:
--------------------------------------------------------------------------
Interface        Type            Status    Speed        Neighbor
or                                         (mbps)     ID   Interface
PIC / Port
vcp-0            Dedicated       Up
```

```
vcp-1           Dedicated       Up
```

Meaning The dedicated VCPs interconnecting the member switches within wiring closets are displayed as **vcp-0** and **vcp-1**. The uplink module VCPs interconnecting member switches (members 0, 2, 5, and 7) across wiring closets are displayed as **1/0** and **1/1** and identified as **Configured**.

Troubleshooting

To troubleshoot a preprovisioned Virtual Chassis configuration that is interconnected across wiring closets, perform these tasks:

Troubleshooting Nonoperational VCPs

Problem A VCP shows a status of **down**.

Solution Check the cable to make sure that it is properly and securely connected to the ports.

- Configuring a Virtual Chassis (J-Web Procedure) on page 784

Example: Configuring Fast Failover on Uplink Module VCPs to Reroute Traffic When a Virtual Chassis Member Switch or Intermember Link Fails

The Virtual Chassis fast failover feature is a hardware-assisted failover mechanism that automatically reroutes traffic and reduces traffic loss in the event of a link or switch failure. If a link between two members fails, traffic flow between those members must be rerouted quickly so that there is minimal traffic loss.

Fast failover is enabled by default on all dedicated Virtual Chassis ports (VCPs).

This example describes how to configure fast failover on uplink module VCPs in a Virtual Chassis configuration:

Requirements

This example uses the following hardware and software components:

- Six J-EX4200-24T switches
- Four SFP uplink modules

Before you begin configuring fast failover, be sure you have:

1. Mounted the switches. See Mounting a J-EX4200 Switch on Two Posts in a Rack or Cabinet, Mounting a J-EX4200 Switch on a Desk or Other Level Surface, or Mounting a J-EX4200 Switch on a Wall.
2. Cabled the switches in a multiple-ring topology to create the Virtual Chassis configuration. See Connecting a Virtual Chassis Cable to a J-EX4200 Switch and “Example: Configuring a Virtual Chassis Interconnected Across Multiple Wiring Closets” on page 733. See Figure 20 on page 765 for an illustration of a multiple-ring topology.

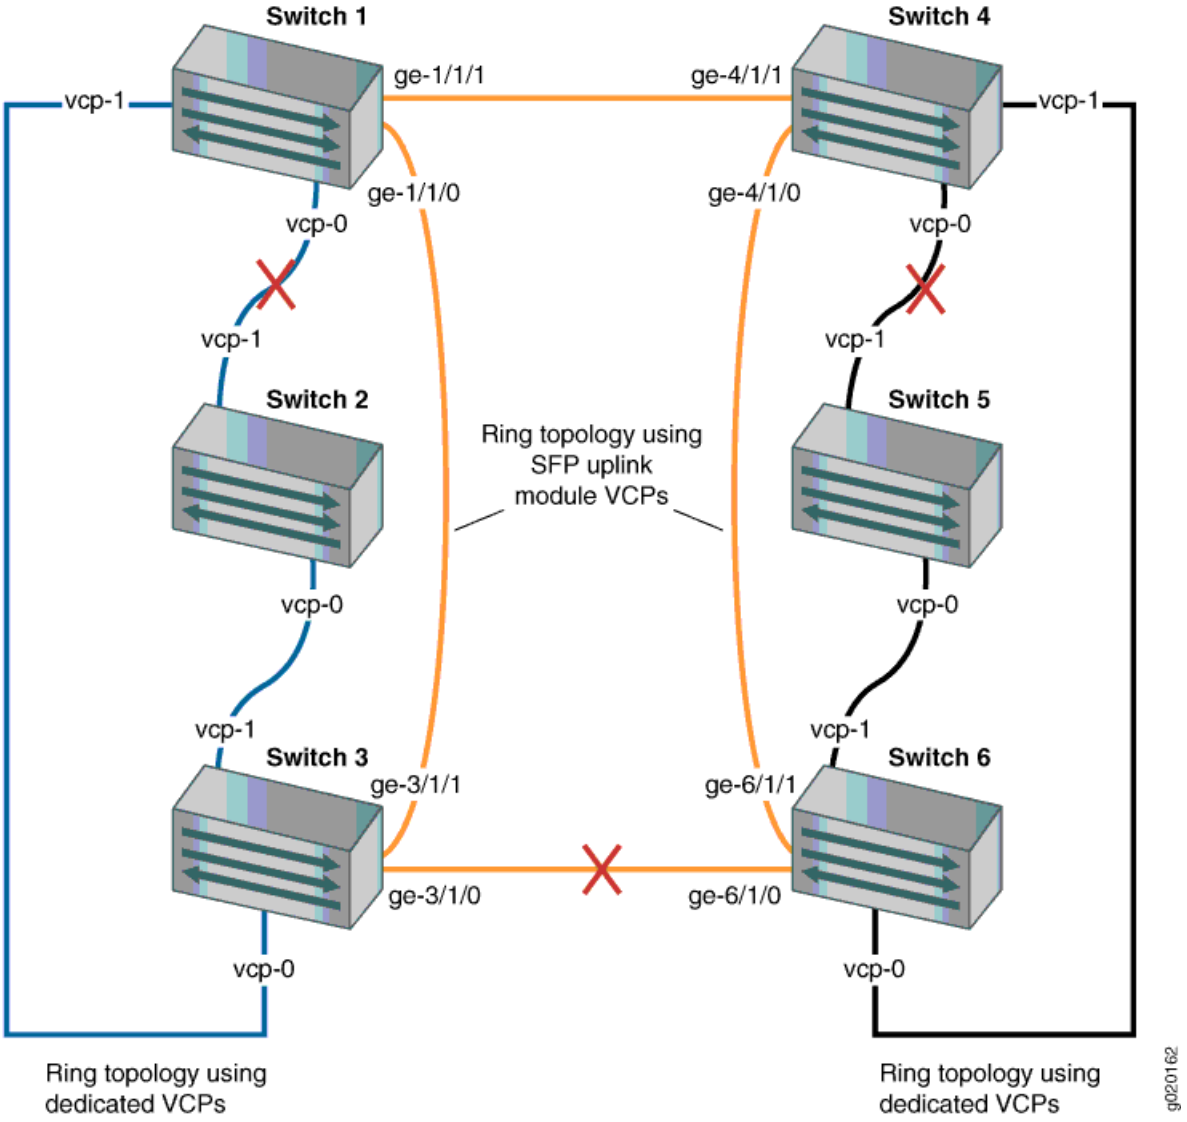
Overview and Topology

In a Virtual Chassis configuration, fast failover automatically reroutes traffic and reduces traffic loss in the event of a link failure or a member switch failure. By default, fast failover is enabled on all dedicated Virtual Chassis ports (VCPs). If you configure uplink module ports as VCPs, you must manually configure fast failover on these ports.

For fast failover to be effective, the Virtual Chassis members must be configured in a ring topology. The ring topology can be formed by using either dedicated Virtual Chassis ports (VCPs) or user-configured uplink module VCPs. Fast failover is supported only in a ring topology that uses identical port types, for example, either a topology that uses all dedicated VCPs or one that uses all uplink module VCPs. Fast failover is not supported in a ring topology that includes both dedicated VCPs and uplink module VCPs. Fast failover is supported, however, in a Virtual Chassis configuration that consists of multiple rings.

Figure 20 on page 765 shows an example of a multiple-ring topology.

Figure 20: Traffic Redirected by Fast Failover After VCP Link Failures in a Topology with Multiple Rings



This example shows how to enable fast failover on uplink module VCPs.

The topology for this example consists of six switches:

- Six J-EX4200-24T switches, four of which have an SFP uplink module installed (switches 1, 3, 4, and 6)

Configuration

To configure the fast failover feature on uplink module VCPs:

CLI Quick Configuration

To configure fast failover on all SFP uplink module VCPs, copy the following command and paste it into the terminal window on switch 1:

```
[edit]
set virtual-chassis fast-failover ge
```

Step-by-Step Procedure

To configure fast failover on SFP uplink module VCPs:

1. Enable fast failover on all SFP uplink module VCPs in the Virtual Chassis configuration:

```
[edit]
user@switch1# set virtual-chassis fast-failover ge
```

NOTE: We recommend that you use the **commit synchronize** command to save any configuration changes that you make to a multimember Virtual Chassis.

Results

Check the results of the configuration:

```
[edit virtual-chassis]
user@switch1# show
fast-failover {
  ge;
}
```

Verification

To confirm that fast failover is enabled on SFP uplink module VCPs in the Virtual Chassis configuration, perform these tasks:

- Verifying That Fast Failover Is Enabled on page 766

Verifying That Fast Failover Is Enabled

Purpose

Verify that fast failover has been enabled in a Virtual Chassis configuration.

Action

1. Issue the **show virtual-chassis fast-failover** command.
2. Check to see that fast failover is enabled.

user@switch1> **show virtual-chassis fast-failover**

```
Fast failover on dedicated VCP ports: Enabled
Fast failover on XE uplink VCP ports: Disabled
Fast failover on GE uplink VCP ports: Enabled
```

Meaning

Fast failover is enabled on all dedicated VCPs and SFP uplink module VCPs in the Virtual Chassis configuration.

Example: Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge

You can explicitly assign a Virtual Chassis ID so that, when two Virtual Chassis configurations merge, the ID that you assigned takes precedence over the automatically assigned Virtual Chassis IDs and becomes the ID of the newly merged Virtual Chassis configuration.

This example describes how to assign the Virtual Chassis ID in a Virtual Chassis configuration:

Requirements

This example uses the following hardware and software components:

- Two J-EX4200-48T switches
- Two J-EX4200-24T switches

Before you begin, be sure you have:

1. Installed the switches. See Mounting a J-EX4200 Switch on Two Posts in a Rack or Cabinet, Mounting a J-EX4200 Switch on a Desk or Other Level Surface, or Mounting a J-EX4200 Switch on a Wall.
2. Cabled the switches to create the Virtual Chassis configuration. See Connecting a Virtual Chassis Cable to a J-EX4200 Switch.

Overview and Topology

Every Virtual Chassis configuration has a unique ID that is automatically assigned when the Virtual Chassis configuration is formed. You can also configure a Virtual Chassis ID using the **set virtual-chassis id** command. When two Virtual Chassis merge, the Virtual Chassis ID that you assigned takes precedence over the automatically assigned Virtual Chassis IDs and becomes the ID for the newly merged Virtual Chassis configuration.

The topology for this example consists of four switches:

- Two J-EX4200-24T switches
- Two J-EX4200-48T switches

The switches are connected as a four-member Virtual Chassis configuration and are identified as switch-A, switch-B, switch-C, and switch-D. The master is switch-A.

Configuration

Assign the Virtual Chassis ID in a Virtual Chassis configuration:

CLI Quick Configuration

To assign a Virtual Chassis ID so that, when two Virtual Chassis configurations merge, the ID that you assigned takes precedence over the automatically assigned Virtual Chassis IDs and becomes the ID of the newly merged Virtual Chassis configuration, copy the following command and paste it into the terminal window:

```
[edit]
set virtual-chassis id 9622.6ac8.5345
```

Step-by-Step Procedure

To assign the Virtual Chassis ID in a Virtual Chassis configuration:

1. Assign the Virtual Chassis ID:

```
[edit]
user@switch-A# set virtual-chassis id 9622.6ac8.5345
```

NOTE: We recommend that you use the **commit synchronize** command to save any configuration changes that you make to a multimember Virtual Chassis configuration.

Verification

To verify that the Virtual Chassis ID has been assigned as you intended, perform these tasks:

- Verifying That the Virtual Chassis ID Is Assigned on page 768

Verifying That the Virtual Chassis ID Is Assigned

Purpose Verify that the Virtual Chassis ID has been assigned in a Virtual Chassis configuration.

Action

1. Issue the **show configuration virtual-chassis id** command.
2. Check to see that the Virtual Chassis ID number is listed.

```
user@switch-A> show configuration virtual-chassis id
id 9622.6ac8.5345;
```

Meaning The Virtual Chassis ID has been assigned as 9622.6ac8.5345.

Related Documentation

Example: Configuring Link Aggregation Groups Using Uplink Virtual Chassis Ports

You can form link aggregation groups (LAGs) between Virtual Chassis member switches in different wiring closets using uplink Virtual Chassis ports (VCPs) and, on J-EX4200-24F switches, network VCPs. LAGs balance traffic across the member links, increase the uplink bandwidth, and provide increased availability. To form LAGs using uplink or network VCPs, you configure the uplink module interfaces or network interfaces on the member switches as VCPs and connect the VCPs using fiber-optic cables. For the LAGs to form, the uplink or network VCPs on each member switch that will form a LAG must operate at the same link speed and you must interconnect at least two uplink or network VCPs on each of those members. You can connect uplink or network VCPs operating at different link speeds, but they will not form a LAG.

NOTE: The LAGs formed by VCPs are different from LAGs formed by Virtual Chassis network interfaces. For more information on LAGs formed by network interfaces, see “Understanding Virtual Chassis Configurations and Link Aggregation” on page 702.

This example shows how to configure uplink module interfaces and network interfaces as VCPs on multiple member switches of a Virtual Chassis configuration and then connect them to form LAGs:

Requirements

This example uses the following hardware and software components:

- Five J-EX4200 switches, one of which is a J-EX4200-24F model
- Four uplink modules

Before you configure the uplink module interfaces and network interfaces on Virtual Chassis member switches as VCPs and interconnect the members to form a LAG, be sure you have:

1. Installed the uplink modules in the SWA-0, SWA-1, SWA-2, and SWA-3 switches. See Installing an Uplink Module in a J-EX4200 Switch.
2. Powered on SWA-0, connected it to the network, and run the EZSetup program. See “Connecting and Configuring a J-EX Series Switch (CLI Procedure)” on page 161 or “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163 for details.
3. Configured SWA-0 with the virtual management Ethernet (VME) interface for remote, out-of-band management of the Virtual Chassis configuration, if desired. See “Configuring the Virtual Management Ethernet Interface for Global Management of a Virtual Chassis (CLI Procedure)” on page 797.
4. Ensured that SWA-1 is not powered on and then interconnected SWA-0 and SWA-1 using the dedicated VCPs on the rear panel.

   NOTE: The interfaces for the dedicated VCPs are operational by default. They do not need to be configured.

5. Ensured that SWA-2, SWA-3, and SWA-4 are not powered on. They are not connected in any way, so when initially powered up they will be standalone switches.

Overview and Topology

In this example, five J-EX4200 switches will be interconnected to form LAGs for ease of monitoring and manageability. Two of these switches (SWA-0 and SWA-1) are located in wiring closet A and the three others (SWA-2, SWA-3, and SWA-4) are located in wiring closet B. SWA-0 will form one LAG with SWA-2 and another LAG with SWA-4, and SWA-1 will form a LAG with SWA-3.

We will use fiber-optic cables connected to the uplink and network VCPs to interconnect the member switches in wiring closet A to the member switches in wiring closet B.

We will specify the highest mastership priority value (255) for SWA-0 to make it the master before we power on SWA-1. Because SWA-0 and SWA-1 are interconnected with the dedicated VCPs, the master detects that SWA-1 is a member of its Virtual Chassis configuration and assigns it a member ID.

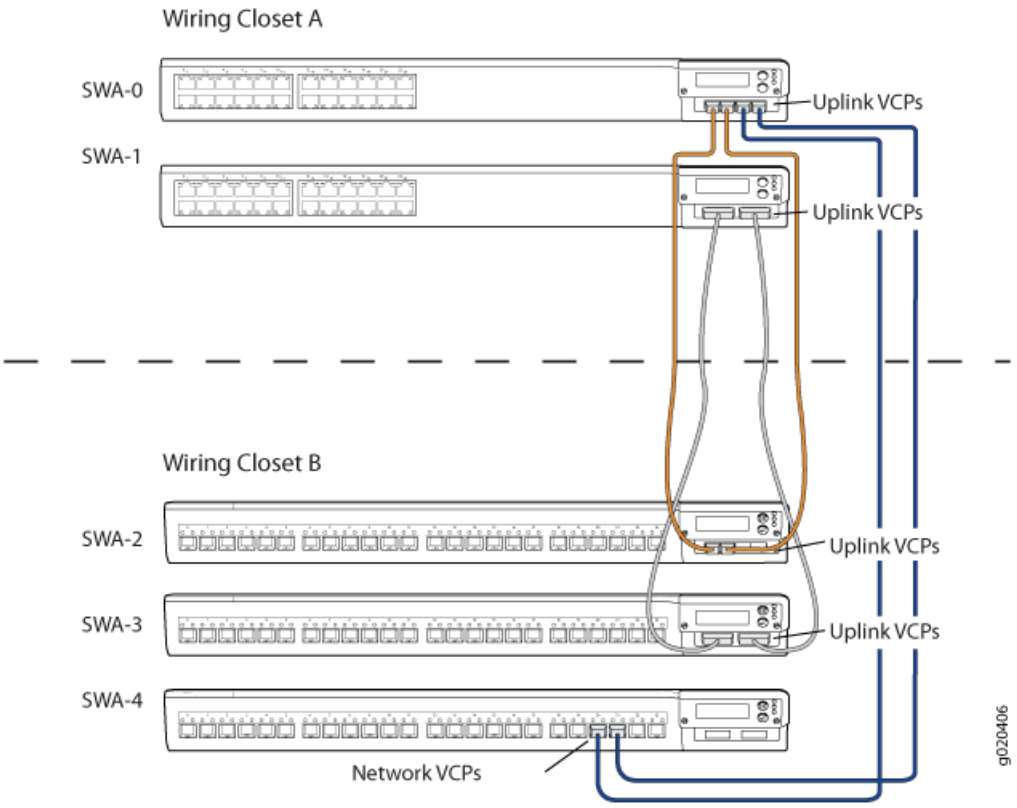
We will use SWA-2 as the backup of the Virtual Chassis configuration. We will configure the same mastership priority value for SWA-2 (255) that we configured for the master. Because we power on SWA-0 before we power on SWA-2, SWA-0 retains mastership of the Virtual Chassis configuration.

NOTE: We recommend setting identical mastership priority values for the master and backup members for high availability and smooth transition of mastership in case the original master becomes unavailable.

We will configure the uplink module interfaces on three of the switches as uplink VCPs. On the J-EX4200-24F switch we will configure two of the network interfaces as VCPs. We will interconnect two of the uplink VCPs on SWA-0 with two of the uplink VCPs on SWA-2. Similarly, we will interconnect the two uplink VCPs on SWA-1 with the two uplink VCPs on SWA-3. Finally, we will connect the two remaining uplink VCPs on SWA-0 with two network VCPs on SWA-4. As a result, three LAGs will be automatically formed.

Figure 21 on page 771 shows the interconnections used to form LAGs using uplink VCPs and the network VCPs after the procedure below has been completed.

Figure 21: Virtual Chassis Interconnected Across Wiring Closets to Form LAGs



Configuration

To configure the Virtual Chassis uplink module interfaces and network interfaces as uplink VCPs and interconnect them between two wiring closets to form LAGs, perform these tasks:

Step-by-Step Procedure

To configure a Virtual Chassis across multiple wiring closets and interconnect them to form LAGs:

1. Configure the mastership priority of SWA-0 (member **0**) to be the highest possible value (**255**), thereby ensuring that it functions as the master of the expanded Virtual Chassis configuration:

```
[edit virtual-chassis]
user@SWA-0# set member 0 mastership-priority 255
```

2. Power on SWA-1.

3. Prepare the members in wiring closet A for interconnecting with the member switches in wiring closet B by setting all the uplink module interfaces on SWA-0 and two of the uplink module interfaces on SWA-1 as uplink VCPs:

```
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 0
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 1
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 2
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 3
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 0 member 1
user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 1 member 1
```

NOTE: This example omits the specification of the member *member-id* option in configuring the uplink VCPs for SWA-0 (and, later, for SWA-2). The command applies by default to the switch where it is executed.

4. Power on SWA-2.

5. If SWA-2 was previously configured, revert to the factory default configuration.

6. Prepare SWA-2 in wiring closet B by configuring its mastership priority to be the highest possible value (255). Its member ID is currently **0**, because it is not yet interconnected with the other members of the Virtual Chassis configuration. It is operating as a standalone switch. Its member ID will change when it is interconnected.

```
[edit virtual-chassis]
user@SWA-2# set member 0 mastership-priority 255
```

NOTE: SWA-2 is configured with the same mastership priority value that we configured for SWA-0. However, the longer uptime of SWA-0 ensures that, once the interconnection is made, SWA-0 functions as the master and SWA-2 functions as the backup.

7. Specify two of the SFP uplink module interfaces in SWA-2 as uplink VCPs. The member IDs are **0**, because they are not yet interconnected with the other members of the Virtual Chassis configuration:

NOTE: The setting of the uplink VCPs remain intact when SWA-2 reboots and joins the Virtual Chassis configuration as member 2.

```
user@SWA-2> request virtual-chassis vc-port set pic-slot 1 port 0
user@SWA-2> request virtual-chassis vc-port set pic-slot 1 port 1
```

8. Power down SWA-2.
9. Physically interconnect SWA-0 and SWA-2 across wiring closets using two of the uplink VCPs on each switch.
10. Power on SWA-2. SWA-2 joins the Virtual Chassis configuration and a LAG is automatically formed between SWA-0 and SWA-2. In addition, although SWA-0 and SWA-2 have the same mastership priority value (255), SWA-0 was powered on first and thus has longer uptime. This results in SWA-0 retaining mastership while SWA-2 reboots and joins the now expanded Virtual Chassis configuration as the backup, with member ID **2**.
11. Power on SWA-3.
12. If SWA-3 was previously configured, revert to the factory default configuration.
13. Specify both uplink module interfaces in SWA-3 as uplink VCPs:

```
user@SWA-3> request virtual-chassis vc-port set pic-slot 1 port 0
user@SWA-3> request virtual-chassis vc-port set pic-slot 1 port 1
```

14. Power down SWA-3.
15. Physically interconnect SWA-3 with SWA-2 using their dedicated VCPs.
16. Physically interconnect SWA-1 and SWA-3 across wiring closets using their uplink VCPs.
17. Power on SWA-3. It joins the Virtual Chassis configuration as member **3**.

NOTE: Member ID 3 is assigned to SWA-3 because SWA-3 was powered on after members 0, 1, and 2.

A LAG is automatically formed between SWA-1 and SWA-3. In addition, both SWA-1 and SWA-3 have the default mastership priority value (128) and function in a linecard role.

18. Power on SWA-4.
19. If SWA-4 was previously configured, revert to the factory default configuration.
20. Configure two of the network interfaces on SWA-4 as uplink VCPs:

```
user@SWA-4> request virtual-chassis vc-port set pic-slot 0 port 20
user@SWA-4> request virtual-chassis vc-port set pic-slot 0 port 21
```

21. Power down SWA-4.

22. Physically interconnect SWA-4 and SWA-0 across wiring closets using the network VCPs on SWA-4 and the two remaining SFP uplink VCPs on SWA-0.
23. Power on SWA-4. A LAG is automatically formed between SWA-4 and SWA-0. In addition, SWA-4 joins the Virtual Chassis configuration in the linecard role.

Results Display the results of the configuration on SWA-0:

```
user@SWA-0> show configuration virtual-chassis
  member 0 {
    mastership-priority 255;
  }
  member 1 {
    mastership-priority 128;
  }
  member 2 {
    mastership-priority 255;
  }
  member 3 {
    mastership-priority 128;
  }
  member 4 {
    mastership-priority 128;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the Member IDs and Roles of the Member Switches on page 774
- Verifying That the VCPs Are Operational on page 775

Verifying the Member IDs and Roles of the Member Switches

Purpose Verify that all the interconnected member switches are included within the Virtual Chassis configuration and that their roles are assigned appropriately.

Action Display the members of the Virtual Chassis configuration:

```
user@SWA-0> show virtual-chassis status

Virtual Chassis ID: 0000.e255.00e0

                                          Mastership            Neighbor List
Member ID  Status  Serial No   Model     Priority  Role        ID Interface

0 (FPC 0)  Prsnt   abc123      ex4200-48t    255   Master*     1 vcp-0
                                                               1 vcp-1
                                                               2 vcp-255/1/0
                                                               2 vcp-255/1/1
                                                               4 vcp-255/0/20
                                                               4 vcp-255/0/21

                                                               0 vcp-1
```

```
                                                                3 vcp-255/1/0
                                                                3 vcp-255/1/1

2 (FPC 2)   Prsnt   ghi789      ex4200-48t    255   Backup      3 vcp-0
                                                                3 vcp-1
                                                                0 vcp-255/1/0
                                                                0 vcp-255/1/1

3 (FPC 3)   Prsnt   jkl012      ex4200-24t    128   Linecard    2 vcp-0
                                                                2 vcp-1
                                                                1 vcp-255/1/0
                                                                1 vcp-255/1/1

4 (FPC 4)   Prsnt   mno345      ex4200-24f    128   Linecard    0 vcp-255/1/2
                                                                0 vcp-255/1/3
```

Meaning The **show virtual-chassis status** command lists the member switches interconnected in a Virtual Chassis configuration with the member IDs that have been assigned by the master, the mastership priority values, and the roles. It also displays the neighbor members with which each member is interconnected by the dedicated VCPs, by uplink VCPs, and by network VCPs.

Verifying That the VCPs Are Operational

Purpose Verify that the dedicated VCPs interconnecting member switches in wiring closets A and B and the uplink and network VCPs interconnecting the member switches between wiring closets are operational.

Action Display the Virtual Chassis interfaces:

```
user@SWA-0> show virtual-chassis vc-port all-members

fpc0:
--------------------------------------------------------------------------
Interface   Type              Trunk  Status       Speed        Neighbor

0/21        Configured          3    Up           1000         0   vcp-255/1/3
```

Meaning The dedicated VCPs are displayed as **vcp-0** and **vcp-1**. The uplink module interfaces that have been set as uplink VCPs are displayed as **1/0**, **1/1**, **1/2**, and **1/3**. The network interfaces that have been set as VCPs are displayed as **0/20** and **0/21**. The neighbor interface names of uplink and network VCPs are of the form **vcp-255/*pic/port***—for example, **vcp-255/1/0**. In that name, **vcp-255** indicates that the interface is a VCP, **1** is the uplink PIC number, and **0** is the port number. The **fpc** number is the same as the member ID. The trunk ID is a positive number ID assigned to the LAG formed by the Virtual Chassis. If no LAG is formed, the value is **–1**.

NOTE: Each switch assigns the trunk IDs to its local interfaces. As a result, the pair of interfaces that form one end of a LAG on one switch will have the same trunk ID, and the pair of interfaces that form the other end of the LAG will have the same trunk ID, but the trunk IDs on either end of the LAG might be different. For example, in Figure 21 on page 771, the uplink VCPs 1/2 and 1/3 on SWA-0 form a LAG with the network VCPs 0/20 and 0/21 on SWA-4. Uplink VCPs 1/2 and 1/3 on SWA-0 both have trunk ID 4, while network VCPs 0/20 and 0/21 on SWA-4 both have trunk ID 3. The trunk IDs are different between the switches because SWA-0 assigns the trunk IDs for its local uplink VCPs and SWA-4 assigns the trunk IDs for its local VCPs.

Troubleshooting

To troubleshoot a Virtual Chassis configuration that is interconnected across wiring closets, perform this task:

Troubleshooting Nonoperational VCPs

Problem An uplink VCP shows a status of **down**.

Solution

- Check the cable to make sure that it is properly and securely connected to the interfaces.
- If the VCP is an uplink module interface, make sure that it has been explicitly set as an uplink VCP.
- If the VCP is an uplink module interface, make sure that you have specified the options (***pic-slot***, ***port***, and ***member***) correctly.

Related Documentation

- Reverting to the Default Factory Configuration for the J-EX Series Switch on page 341

Example: Configuring Automatic Software Update on Virtual Chassis Member Switches

The automatic software update feature automatically updates the Junos OS version on prospective member switches as they are added to a Virtual Chassis configuration of J-EX4200 Ethernet Switches so the new member switch immediately joins the Virtual Chassis configuration and is put in the active state. If the software version on the new switch is not the same as the version running on the master, the master keeps the new switch in the inactive state. If you have not enabled the automatic software update feature, you will have to manually install the correct software version on each prospective member switch as it is added to the Virtual Chassis configuration.

This example describes how to configure the Virtual Chassis automatic software update feature:

Requirements

This example uses the following hardware and software components:

- Three J-EX4200 switches

Before you begin, be sure you have:

1. Ensured that two member switches are running the same version of the Junos OS for J-EX Series switches so that they can form the initial Virtual Chassis configuration.
2. Cabled and powered on those two switches to create the Virtual Chassis configuration. See Connecting a Virtual Chassis Cable to a J-EX4200 Switch.
3. Ensured that you know the name or the URL of the software package to be used by the automatic software update feature.

Overview and Topology

For a standalone J-EX4200 switch to join an existing Virtual Chassis configuration, it must be running the same version of the Junos OS that is running on the Virtual Chassis master. If the software version on the new switch is not the same as the version running on the master, the master keeps the new switch in the inactive state.

The topology for this example consists of three J-EX Series switches. Two of the switches are connected in a Virtual Chassis configuration and are therefore running the same version of the Junos OS for J-EX Series switches. The third switch is a standalone switch that is running a different software version than the Virtual Chassis member switches. In this example, we will enable the automatic software update feature on the Virtual Chassis configuration and then add the third switch to the configuration. The master will detect the presence of the new switch, check the software version running on the new switch, and, because it is not the same version currently running on the master, will update the software version on the new switch and reboot the switch so that it can join the Virtual Chassis configuration and immediately be put in the active state.

Configuration

To configure automatic software update, perform this task:

Step-by-Step Procedure

To configure automatic software update:

1. Enable automatic software update and configure the path to the software package:

```
[edit]
user@switch# set virtual-chassis auto-sw-update package-name
/var/tmp/jinstall-ex-4200-10.2R1.1-domestic-signed.tgz
```

2. Connect and power on the new switch to be added to the existing Virtual Chassis configuration.

Results

Check the results of the configuration:

```
[edit virtual-chassis]
```

```
user@switch# show
auto-sw-update {
   package-name /var/tmp/jinstall-ex-4200-10.2R1.1-domestic-signed.tgz;
}
```

Verification

To verify that the software version on the new switch has been updated and that the switch has joined the Virtual Chassis configuration, perform this task:

- Verifying That the Software Version Is Updated on page 779

Verifying That the Software Version Is Updated

Purpose Verify that the new switch has joined the Virtual Chassis configuration.

NOTE: If the software version on the new switch had not been updated successfully, the master would not allow the switch to join the Virtual Chassis configuration.

Action

1. Issue the **show virtual-chassis status** command.
2. Check to see that the new member switch has been added.

```
user@switch> show virtual-chassis status
Virtual Chassis ID: 0019.e250.47a0
                                                Mastership            Neighbor List
Member ID  Status   Serial No    Model    priority    Role      ID  Interface
0 (FPC 0)  Prsnt    AK0207360276 ex4200-24t      255  Master*    1  vcp-1
                                                                 2  vcp-0
1 (FPC 1)  Prsnt    AK0207360281 ex4200-24t      255  Backup     2  vcp-1
                                                                 0  vcp-0
2 (FPC 2)  Prsnt    AJ0207391130 ex4200-48t      128  Linecard   0  vcp-1
                                                                 1  vcp-0
```

Meaning Because in the initial two-member Virtual Chassis configuration member 0 was the master and member 1 was the backup, the output shows that the new switch has been assigned member ID **2** and has been given the **Linecard** role. The **Status** field shows that member 2 is **Prsnt**, which means that it is in the active state.

CHAPTER 45

Configuring Virtual Chassis

Configuring a Virtual Chassis (CLI Procedure)

To take advantage of the scalability features of J-EX4200 switches, you can configure a Virtual Chassis that includes up to 10 member switches. You can interconnect the member switches using the dedicated Virtual Chassis ports (VCPs) on the back of the switch. You do not have to configure the interface for the dedicated VCPs. If you want to interconnect member switches that are located in different racks or wiring closets, interconnect them using uplinks configured as VCP interfaces. See “Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)” on page 792.

NOTE: A multimember Virtual Chassis configuration has two Routing Engines, one in the master and the other in the backup. Therefore, we recommend that you always use **commit synchronize** rather than simply **commit** to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved in both Routing Engines.

A Virtual Chassis can be configured with either:

- preprovisioned configuration—Allows you to deterministically control the member ID and role assigned to a member switch by tying it to its serial number.
- nonprovisioned configuration—The master sequentially assigns a member ID to other member switches. The role is determined by the mastership priority value and other factors in the master election algorithm.

- Configuring a Virtual Chassis with a Preprovisioned Configuration File on page 782
- Configuring a Virtual Chassis with a Nonprovisioned Configuration File on page 783

Configuring a Virtual Chassis with a Preprovisioned Configuration File

To configure a Virtual Chassis using a preprovisioned configuration:

1. Make a list of the serial numbers of all the switches to be connected in a Virtual Chassis configuration.
2. Note the desired role (**routing-engine** or **linecard**) of each switch. If you configure the member with a **routing-engine** role, it is eligible to function as a master or backup. If you configure the member with a **linecard** role, it is not eligible to become a master or backup.
3. Interconnect the member switches using the dedicated VCPs on the rear panel of switches. See Connecting a Virtual Chassis Cable to a J-EX4200 Switch.

   NOTE: Arrange the switches in sequence, either from top to bottom or from bottom to top (0–9).

4. Power on only the switch that you plan to use as the master switch (SWA-0). Do not power on the other switches at this time.
5. Run the EZ Setup program on SWA-0, specifying the identification parameters. See “Connecting and Configuring a J-EX Series Switch (CLI Procedure)” on page 161 for details.

   NOTE: The properties that you specify for SWA-0 apply to the entire Virtual Chassis configuration, including all the member listed in the preprovisioned configuration file.

6. Configure SWA-0 with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis configuration, if desired.

```
[edit]
user@SWA-0# set interfaces vme unit 0 family inet address /ip-address/mask/
```

7. Specify the preprovisioned configuration mode:

```
[edit virtual-chassis]
user@SWA-0# set preprovisioned
```

8. Specify all the members that you want to included in the Virtual Chassis configuration, listing each switch's serial number with the desired member ID and the desired role:

```
[edit virtual-chassis]
user@SWA-0# set member 0 serial-number abc123 role routing-engine
user@SWA-0# set member 1 serial-number def456 role linecard
user@SWA-0# set member 2 serial-number ghi789 role linecard
user@SWA-0# set member 3 serial-number jkl012 role linecard
user@SWA-0# set member 4 serial-number mno345 role linecard
user@SWA-0# set member 5 serial-number pqr678 role routing-engine
user@SWA-0# set member 6 serial-number stu901 role linecard
user@SWA-0# set member 7 serial-number vwx234 role linecard
user@SWA-0# set member 8 serial-number yza567 role linecard
user@SWA-0# set member 9 serial-number bcd890 role linecard
```

9. Power on the member switches.

NOTE: You cannot modify the **mastership-priority** when you are using a preprovisioned configuration. The mastership priority values are generated automatically and controlled by the role that is assigned to the member switch in the configuration file. The two routing engines are assigned the same mastership priority value. However, the member that was powered on first has higher prioritization according to the master election algorithm. See "Understanding How the Master in a Virtual Chassis Configuration Is Elected" on page 698.

Configuring a Virtual Chassis with a Nonprovisioned Configuration File

To configure the Virtual Chassis using a nonprovisioned configuration:

1. Interconnect the member switches using the dedicated VCPs on the rear panel of switches. See Connecting a Virtual Chassis Cable to a J-EX4200 Switch.

NOTE: Arrange the switches in sequence, either from top to bottom or from bottom to top (0–9).

2. Power on only the switch that you plan to use as the master switch (SWA-0). Do not power on the other switches at this time.
3. Run the EZ Setup program on SWA-0, specifying the identification parameters. See "Connecting and Configuring a J-EX Series Switch (CLI Procedure)" on page 161 for details.

NOTE: The properties that you specify for SWA-0 apply to the entire Virtual Chassis configuration, including all the members interconnected through VCPs..

4. Configure SWA-0 with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis configuration, if desired.

```
[edit]
user@SWA-0# set interfaces vme unit 0 family inet address /ip-address/mask/
```

5. Configure mastership priority for the master, backup, and other members, if desired:

```
[edit virtual-chassis]
user@SWA-0# set member 0 mastership-priority 255
user@SWA-0# set member 5 mastership-priority 255
```

6. Power on the member switches in sequential order, one by one.

NOTE: If you do not edit the Virtual Chassis configuration file, a nonprovisioned configuration is generated by default. The mastership priority value for each member switch is 128. The master role is selected by default. You can change the role that is performed by the members by modifying the **mastership-priority**. See "Configuring Mastership of the Virtual Chassis (CLI Procedure)" on page 790. We recommend that you specify the same mastership priority value for the desired master and backup members. We have assigned the highest possible mastership priority to two members. However, the member that was powered on first has higher prioritization according to the master election algorithm. See "Understanding How the Master in a Virtual Chassis Configuration Is Elected" on page 698. We have allowed the other members to use the default mastership priority, which qualifies them to function in the role of linecard.

NOTE: If you want to change the member ID that the master has assigned to a member switch, use the **request virtual-chassis renumber** command.

Configuring a Virtual Chassis (J-Web Procedure)

To take advantage of the scalability features of J-EX4200 switches, you can configure a Virtual Chassis that includes up to 10 member switches. You can interconnect the

member switches using the dedicated Virtual Chassis ports (VCPs) on the back of the switch. You do not have to configure the interface for the dedicated VCPs. If you want to interconnect member switches that are located in different racks or wiring closets, interconnect them using uplinks configured as VCP interfaces. See “Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)” on page 792.

To configure a Virtual Chassis for J-EX Series switches using the J-Web interface:

1. Select **Configure** > **Virtual Chassis**.

   

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See “Using the Commit Options to Commit Configuration Changes (J-Web Procedure)” on page 334 for details about all commit options.

2. The properties you can configure are displayed.

   The first section of the Virtual Chassis Configuration page displays the Virtual Chassis member configuration. the display includes a list of member switches, their member IDs, and the mastership priority.

   The second section displays the operational status of the Virtual Chassis configuration, member details, and the dedicated and configured Virtual Chassis ports (VCPs).

3. Enter information into the page as described in Table 107 on page 785.

4. Click one:

   - **Add**—To add a member's configuration to the Virtual Chassis configuration, click **Add**.
   - **Edit**—To modify an existing member's configuration, click **Edit**.
   - **Delete**—To delete the configuration of a member, click **Delete**.

5. To configure an uplink as a VCP, select the member in the Virtual Chassis members list and select **Action > Select Uplink Port as VCP**. Select the port from the list.

6. To delete an uplink VCP from a member, select the member in the Virtual Chassis members list and select **Action > Delete Uplink Port as VCP**.

Table 107: Virtual Chassis Configuration Fields

Field	Function	Your Action
Member Details		
Member ID	Specifies the identifier for the member switch. The master switch assigns member IDs.	Select an identifier from the list. Select an ID from **0** through **9**.
Priority	Specifies the mastership priority to be assigned to the member.	Select a number from **1** through **255**, with 255 being the highest priority (**128** is the default).

Table 107: Virtual Chassis Configuration Fields *(continued)*

Field	Function	Your Action
Disable Management VLAN	If you want to reserve an individual member's management Ethernet port for local troubleshooting, you can remove that port from being part of the Virtual Management Ethernet (VME).	Click to disable management VLAN on the port.
Refresh	Refreshes the operational status of Virtual Chassis members.	Click to refresh the operational status.

- Virtual Chassis Overview on page 691

Adding a New Switch to an Existing Virtual Chassis Configuration (CLI Procedure)

You can add one or more J-EX4200 switches to an existing Virtual Chassis configuration. Up to ten J-EX4200 switches can be included within a Virtual Chassis configuration. You can add the new switches to either type—nonprovisioned or preprovisioned—of Virtual Chassis configuration. See “Configuring a Virtual Chassis (CLI Procedure)” on page 781 for descriptions of these types.

To add a switch to an existing Virtual Chassis configuration, use the procedure that matches what you need to accomplish:

- Adding a New Switch to an Existing Virtual Chassis Configuration Within the Same Wiring Closet on page 786
- Adding a New Switch from a Different Wiring Closet to an Existing Virtual Chassis Configuration on page 787
- Adding a New Switch to an Existing Preprovisioned Virtual Chassis Configuration Using Autoprovisioning on page 789

Adding a New Switch to an Existing Virtual Chassis Configuration Within the Same Wiring Closet

Before you begin, be sure you have:

- Mounted the new switch in a rack.
- Confirmed that the new switch is powered off.

- If you are expanding a preprovisioned configuration, made a note of the serial number (on the back of the switch). You will need to edit the Virtual Chassis configuration to include the serial number of the new member switch.
- If you are expanding a preprovisioned configuration, edited the existing Virtual Chassis configuration to include the serial number of the new member switch. You can specify the role of the new member switch when you add its serial number in the Virtual Chassis configuration file. The parameters specified in the master Virtual Chassis configuration file are applied after the new member switch has been interconnected to an existing member switch.

NOTE: After you have created a preprovisioned Virtual Chassis configuration, you can use the autoprovisioning feature to add member switches to that configuration.

To add a new member switch to an existing Virtual Chassis configuration within the same wiring closet:

1. If the new member switch has been previously configured, revert that switch's configuration to the factory defaults. See "Reverting to the Default Factory Configuration for the J-EX Series Switch" on page 341.
2. Interconnect the unpowered new switch to at least one member of the existing Virtual Chassis configuration using the dedicated Virtual Chassis ports (VCPs).
3. Power on the new switch.
4. Confirm that the new member switch is now included within the Virtual Chassis configuration by checking the front-panel display for the member ID. It should display a member ID that is higher than 0 (1 through 9), because there is already at least one member of the Virtual Chassis configuration.

NOTE: If you are using a preprovisioned configuration, the member ID is automatically assigned to the member's serial number in the configuration file.

Adding a New Switch from a Different Wiring Closet to an Existing Virtual Chassis Configuration

To add a new switch from a different wiring closet to an existing Virtual Chassis configuration, you must use a long cable to connect the new member switch across wiring closets. You can use a port on an SFP or SFP+ uplink module, or an SFP network port on a J-EX4200-24F switch, and a fiber-optic cable for this purpose.

Before you begin, be sure you have:

- Installed the uplink modules needed for the Virtual Chassis configuration.
- Mounted the new switch in a rack.

- If the new member switch has been previously configured, reverted its configuration to the factory defaults. See “Reverting to the Default Factory Configuration for the J-EX Series Switch” on page 341.
- Powered on the new member switch as a standalone switch and configured its uplink module ports as VCPs. Otherwise, it cannot be recognized as a member switch by the master.
- If you are expanding a preprovisioned configuration, made a note of the serial number (on the back of the switch). You will need to edit the Virtual Chassis configuration to include the serial number of the new member switch.
- If you are expanding a preprovisioned configuration, edited the existing Virtual Chassis configuration to include the serial number of the new member switch. You can specify the role of the new member switch when you add its serial number in the Virtual Chassis configuration file. The parameters specified in the master Virtual Chassis configuration file are applied after the new member switch has been interconnected with its uplink VCP to an existing member switch.
- Confirmed that the new, currently standalone switch is powered off.
- Prepared an existing member switch for interconnecting with the new switch through an uplink module port by configuring an uplink module port as a VCP on the existing member switch.

NOTE: After you have created a preprovisioned Virtual Chassis configuration, you can use the autoprovisioning feature to add member switches to that configuration.

To add a new member switch that is going to be interconnected with the existing Virtual Chassis configuration across wiring closets:

1. Power on the new switch.
2. Connect a laptop or terminal to the console port of the switch, or use EZSetup on the standalone switch to specify temporary identification parameters. (When you interconnect the new member switch with the existing Virtual Chassis configuration, the master will overwrite and disable any specified parameters that conflict with the Virtual Chassis parameters or assigned member configuration.)
3. Use the CLI or the J-Web interface to set the uplink module ports as VCPs.

NOTE: If you are using a nonprovisioned configuration, you might configure the new member switch with a mastership priority value that is less than that of the existing member switches. Doing so ensures that the new member switch will function in a linecard role when it is included within the Virtual Chassis configuration.

4. Power off the new switch.

5. Interconnect the new member switch to at least one member of the existing Virtual Chassis configuration using the uplink module ports on each of the switches that have been configured as VCPs.
6. Power on the new member switch.
7. Confirm that the new member switch is now included within the Virtual Chassis configuration by checking the front-panel display for the member ID. It should display a member ID that is higher than 0 (1 through 9), because there is already at least one member of the Virtual Chassis configuration.

NOTE: If you are using a preprovisioned configuration, the member ID is automatically assigned to the member's serial number in the configuration file.

Adding a New Switch to an Existing Preprovisioned Virtual Chassis Configuration Using Autoprovisioning

Before you begin, be sure you have:

- Installed the uplink modules needed for the Virtual Chassis configuration.
- Mounted the new switch in a rack.
- Ensured that the preprovisioned Virtual Chassis configuration has an active master. For more information, see “Example: Configuring a Virtual Chassis Using a Preprovisioned Configuration File” on page 752.
- On the master, configured the Link Level Discovery Protocol (LLDP) on the uplink module ports that will be used as VCPs. LLDP is configured by default but might have been disabled. To configure LLDP, see “Configuring LLDP (CLI Procedure)” on page 2344 or “Configuring LLDP (J-Web Procedure)” on page 2345.
- Ensured that the new member switch has the factory-default configuration. If the new member switch has been previously configured, revert its configuration to the factory defaults. See “Reverting to the Default Factory Configuration for the J-EX Series Switch” on page 341.
- Made a note of the serial number (on the back of the switch). You will need to edit the Virtual Chassis configuration to include the serial number of the new member switch.
- Edited the existing Virtual Chassis preprovisioned configuration to include the serial number of the new member switch. You can specify the role of the new member switch when you add its serial number to the Virtual Chassis configuration file. The parameters specified in the master Virtual Chassis configuration file are applied to the new member switch after it has been interconnected through its uplink VCP to an existing member switch.
- Prepared an existing member switch to interconnect with the new switch through an uplink module port by configuring an uplink module port as a VCP on the existing member switch.

- Ensured that the operational modes of the uplink modules on the existing member switch and the new member switch match.
- Confirmed that the new member switch is powered off.
- Interconnected the existing switch with the new switch using the appropriate cable.

If these conditions are not met, autoprovisioning will not work and you will need to manually configure uplink module ports on the switch to be added to the configuration to be VCPs. For more information, see "Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)" on page 792.

To add a switch to an existing preprovisioned Virtual Chassis configuration using the autoprovisioning feature:

1. Power on the new member switch.
2. Confirm that the new member switch is now included in the Virtual Chassis configuration by checking the front-panel display for the member ID. It should display a member ID in the range from 0 through 9 because there was already at least one member of the Virtual Chassis configuration. The member ID is automatically assigned to the new member switch's serial number in the configuration file.

Configuring Mastership of the Virtual Chassis (CLI Procedure)

You can designate the role (master, backup, or linecard) that a member switch performs within a Virtual Chassis configuration whether or not you are using a preprovisioned configuration.

NOTE: A multimember Virtual Chassis configuration has two Routing Engines, one in the master and the other in the backup. Therefore, we recommend that you always use **commit synchronize** rather than simply **commit** to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved in both Routing Engines.

This topic describes:

- Configuring Mastership Using a Preprovisioned Configuration File on page 791
- Configuring Mastership Using a Configuration File That Is Not Preprovisioned on page 792

Configuring Mastership Using a Preprovisioned Configuration File

To configure mastership using a preprovisioned configuration:

1. Note the serial numbers of the switches that you want to function in the master role and backup role.
2. Power on only the switch (SWA-0) that you want to function in the master role.
3. Edit the configuration to specify the preprovisioned configuration mode:

```
[edit virtual-chassis]
user@SWA-0# set preprovisioned
```

4. List the serial numbers of the member switches that you want to function as master and backup, specifying their role as **routing-engine**:

```
[edit]

user@SWA-0# set virtual-chassis member 0 serial-number abc123 role routing-engine

user@SWA-0# set virtual-chassis member 2 serial-number def456 role routing-engine
```

NOTE: You cannot directly modify the mastership priority value when you are using a preprovisioned configuration. The mastership priority values are generated automatically and controlled by the role that is assigned to the member switch in the configuration file. The two members assigned the routing-engine role are assigned the same mastership priority value (128). However, the member that was powered on first has higher prioritization according to the master election algorithm. See "Understanding How the Master in a Virtual Chassis Configuration Is Elected" on page 698. Only two members can be specified with the routing-engine role.

5. List the serial numbers of any other member switches that you want to include in the Virtual Chassis configuration. You may also specify their role as **linecard**, if desired.

Configuring Mastership Using a Configuration File That Is Not Preprovisioned

To configure mastership of the Virtual Chassis through a configuration that is not preprovisioned:

1. Power on only the switch that you want to function in the master role (SWA-0).
2. Configure the highest possible mastership priority value (**255**) for the member that you want to function in the master role:

```
[edit virtual-chassis]
user@SWA-0# set member 0 mastership-priority 255
```

3. Configure the same mastership priority value (continue to edit the Virtual Chassis configuration on the master) for the member that you want to be the backup (SWA-1):

```
[edit virtual-chassis]
user@SWA-0# set member 1 mastership-priority 255
```

NOTE: We recommend that the master and backup have the same mastership priority value to prevent the master and backup status from switching back and forth between master and backup members in failover conditions.

4. Use the default mastership priority value (**128**) for the remaining member switches or configure the mastership priority to a value that is lower than the value specified for members functioning in the master and backup roles.

- Configuring a Virtual Chassis (J-Web Procedure) on page 784
- Understanding Virtual Chassis Configuration on page 704

Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)

You can interconnect J-EX4200 switches that are beyond the reach of the Virtual Chassis cables as members of a Virtual Chassis configuration by installing the optional SFP or SFP+ uplink module and connecting the uplink ports. You can also use the SFP network ports on a J-EX4200-24F for this purpose. To use the uplink ports or SFP network ports for interconnecting member switches, you must explicitly set the uplink ports as VCPs.

NOTE: When an uplink port is set as a VCP interface, it cannot be used for any other purpose. You can set one port as a VCP interface and configure the other port in trunk mode as an uplink to a distribution switch.

Before you set an uplink port as a VCP:

1. Install the uplink module in the member switches that you want to interconnect.
2. Power on and connect to the switch that you plan to designate as the master of the Virtual Chassis configuration.

NOTE: Do not power on the other switches at this point.

3. Run EZSetup on the switch that you are configuring to be the master. Follow the prompts to specify the hostname and other identification, time zone, and network properties. See “Connecting and Configuring a J-EX Series Switch (CLI Procedure)” on page 161 or “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163 for details. The properties that you specify for the master apply to the entire Virtual Chassis configuration, including all the member switches that you later interconnect with the master.
4. If you want to configure and manage the Virtual Chassis configuration remotely, specify the VME global management interface. You can configure the VME global management interface when you are setting up the master or you can do it after completing the other configuration steps for the Virtual Chassis. See “Configuring the Virtual Management Ethernet Interface for Global Management of a Virtual Chassis (CLI Procedure)” on page 797.
5. Configure mastership of the Virtual Chassis using either the nonprovisioned or preprovisioned configuration. See “Configuring Mastership of the Virtual Chassis (CLI Procedure)” on page 790 for details.

NOTE: A multimember Virtual Chassis configuration has two Routing Engines, one in the master and the other in the backup. Therefore, we recommend that you always use **commit synchronize** rather than simply **commit** to save configuration changes made for a Virtual Chassis configuration. This ensures that the configuration changes are saved in both Routing Engines.

To interconnect a Virtual Chassis configuration across longer distances, such as wiring closets, you need to:

- Prepare the existing Virtual Chassis configuration for interconnecting with a potential member switch that is beyond the reach of a Virtual Chassis cable by setting at least one uplink VCP on an existing member of Virtual Chassis configuration.
- Prepare the potential member switch for interconnecting with the existing Virtual Chassis configuration by setting at least one uplink VCP on the standalone switch.

NOTE: We recommend that you set two uplink VCPs within each wiring closet for redundancy.

This topic describes:

1. Setting an Uplink VCP Between Two Member Switches on page 794
2. Setting an Uplink VCP on a Standalone Switch on page 794

Setting an Uplink VCP Between Two Member Switches

Set an uplink port of a Virtual Chassis member as a VCP by executing the operational command **request virtual-chassis vc-port**.

NOTE: If you use the SFP+ uplink module, you must configure all member switches to support either 1-gigabit SFP transceivers or 10-gigabit SFP+ transceivers. See “Setting the Mode on an SFP+ Uplink Module (CLI Procedure)” on page 921.

To set the uplink ports for the local member switch (for example, member 0) and for a different member switch (for example, member 1) to function as VCPs:

1. Set one uplink port of member 0 as a VCP interface. You do not need to specify the **member** ***member-id*** option, because the command applies by default on the member where it is executed.

   ```
   user@SWA-0> request virtual-chassis vc-port set pic-slot 1 port 0
   ```

2. Set one uplink port of member 1 as a VCP interface.

   ```
   user@SWA-0>request virtual-chassis vc-port set pic-slot 1 port 0 member 1
   ```

   This example includes the member *member-id* option, because it is executed on a different member switch than the local member switch.

Setting an Uplink VCP on a Standalone Switch

To set an uplink VCP on a standalone switch, first power on the switch. You must set an uplink port on the standalone switch as a VCP prior to physically interconnecting the switch with the existing Virtual Chassis configuration. Otherwise, the master cannot detect that the switch is a member of the Virtual Chassis configuration.

To set one uplink VCP on the potential member (SWA-2), which is currently operating as a standalone switch:

1. Power on the standalone switch.
2. Set one uplink port as a VCP interface. You do not need to specify the **member** ***member-id*** option, because the command applies by default on the member where it is executed.

   ```
   user@SWA-2> request virtual-chassis vc-port set pic-slot 1 port 0
   ```

NOTE: If you do specify the **member** *member-id* option, use member ID 0. Because the switch is not yet interconnected with the other members of the Virtual Chassis configuration, its current member ID is 0. Its member ID will change when it is interconnected with the Virtual Chassis configuration. It does not impact the functioning of the uplink VCP that its VCP interface is set with 0 as the member ID. The VCP interface has significance only on the local switch.

3. After you have set the uplink VCP on the standalone switch, physically interconnect its uplink port with the VCP uplink ports of the members in the existing Virtual Chassis configuration.
4. The new member switch reboots and joins the now expanded Virtual Chassis configuration with a different member ID.

NOTE: The setting for the new member switch's uplink VCP remains intact and is not affected by the change of member ID.

5. If you have additional members in the second wiring closet, set a redundant VCP uplink on another member switch by issuing the **request virtual-chassis vc-port** command.

Setting an Uplink Module Port or a J-EX4200-24F Network Port as a Virtual Chassis Port Using the LCD Panel

You can interconnect J-EX4200 switches that are beyond the reach of the Virtual Chassis cables as members of a Virtual Chassis configuration by installing the optional SFP or SFP+ uplink module and connecting the uplink module ports. You can also use the network ports on J-EX4200-24F switches to interconnect Virtual Chassis member switches. To use the uplink module ports or the J-EX4200-24F network ports for interconnecting member switches, you must explicitly set the ports as VCPs.

This topic describes how to set the uplink module ports and the J-EX4200-24F network ports as VCPs using the LCD panel on the front of J-EX4200 switches.

In this procedure, we show how to configure uplink module port **ge-0/1/2** as a VCP.

To set an uplink module port as a VCP using the LCD panel:

1. Press **Menu** until you see **MAINTENANCE MENU**.
2. Press **Menu** until you see **REQUEST VC PORT**.
3. Press **Enter**. You will see **SET VC PORT?**.
4. Press **Enter**. You will see **SET FPC 0?**.
5. Press **Enter**. You will see **SET PIC 0?**.
6. Press **Menu** until you see **SET PIC 1?**.
7. Press **Enter**. You will see **SET PORT 0?**.
8. Press **Menu** until you see **SET PORT 2?**.
9. Press **Enter**. You will see **CONFIGURING ....**
10. Once the configuration has been accepted, press **Enter** to return to the **MAINTENANCE** menu.

You can also use the LCD panel to delete a VCP, thus resetting the port to an uplink module port or a J-EX4200-24F network port.

To reset **vcp-0/1/2** to an uplink module port using the LCD panel:

1. Press **Menu** until you see **MAINTENANCE MENU**.
2. Press **Menu** until you see **REQUEST VC PORT**.
3. Press **Enter**. You will see **SET VC PORT?**.
4. Press **Menu**. You will see **DELETE VC PORT?**.
5. Press **Enter**. You will see **DELETE FPC 0?**.
6. Press **Enter**. You will see **DELETE PIC 0?**.
7. Press **Menu** until you see **DELETE PIC 1?**.
8. Press **Enter**. You will see **DELETE PORT 0?**.
9. Press **Menu** until you see **DELETE PORT 2?**.
10. Press **Enter**. You will see **CONFIGURING ....**
11. Once the configuration has been accepted, press **Enter** to return to the **MAINTENANCE** menu.

Related Documentation

- LCD Panel in J-EX4200 Switches
- Configuring a Virtual Chassis (CLI Procedure) on page 781

Configuring the Virtual Management Ethernet Interface for Global Management of a Virtual Chassis (CLI Procedure)

If you want to configure and manage a Virtual Chassis remotely through SSH or Telnet, configure the virtual management Ethernet (VME) interface on the master of the Virtual Chassis. You can configure and manage all members of the Virtual Chassis through this single global interface.

1. Power on the switch that you want to function as the master.
2. Check the front-panel LCD to confirm that the switch has powered on correctly.
3. Run the EZ Setup program on the switch, specifying the identification parameters. See "Connecting and Configuring a J-EX Series Switch (CLI Procedure)" on page 161 or "Connecting and Configuring a J-EX Series Switch (J-Web Procedure)" on page 163 for details.

To configure the VME:

```
[edit]
user@SWA-0# set interfaces vme unit 0 family inet address /ip-address/mask/
```

Related Documentation

- Understanding Global Management of a Virtual Chassis Configuration on page 699

Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as Master of Virtual Chassis (CLI Procedure)

When a backup member takes control of a Virtual Chassis configuration because of a reset or other temporary failure, the backup uses the MAC address of the old master. This helps to ensure a smooth transition of mastership with no disruption to network connectivity.

The MAC persistence timer is used in situations when the master is no longer a member of the Virtual Chassis configuration, because it has been physically disconnected or removed. If the old master does not rejoin the Virtual Chassis configuration before the timer elapses, the new master starts using its own MAC address.

The default timer value is 10 minutes. There are no minimum or maximum limits.

Before you begin configuring the timer, ensure that you have at least two member switches in the Virtual Chassis configuration. To configure or modify the MAC persistence timer, use the following command:

```
[edit virtual-chassis]
user@switch# set mac-persistence-timer 30
```

This command modifies the MAC persistence timer value to specify a timer value of 30 minutes rather than the default timer value of 10 minutes.

Configuring Fast Failover in a Virtual Chassis Configuration

The Virtual Chassis fast failover feature is a hardware-assisted failover mechanism that automatically reroutes traffic and reduces traffic loss in the event of a link or switch failure. If a link between two members fails, traffic flow between those members must be rerouted quickly so that there is minimal traffic loss.

While fast failover is enabled by default on dedicated Virtual Chassis ports (VCPs), you must manually enable fast failover on uplink module ports that have been configured as VCPs.

Before you begin configuring fast failover, ensure that the dedicated VCPs or uplink module VCPs are connected in a ring topology.

- To reenable the fast failover feature on all dedicated VCPs in a ring:

```
[edit]
user@switch# delete virtual-chassis fast-failover vcp disable
```

- To configure the fast failover feature on all SFP uplink module VCPs in a ring:

```
[edit]
user@switch# set virtual-chassis fast-failover ge
```

Related Documentation

Disabling Fast Failover in a Virtual Chassis Configuration

While fast failover is enabled by default on dedicated Virtual Chassis ports (VCPs), you can manually disable fast failover on dedicated VCPs using the **set virtual-chassis fast-failover vcp disable** command.

- To disable the fast failover feature on all dedicated VCPs in a ring:

```
[edit]
user@switch# set virtual-chassis fast-failover vcp disable
```

- To disable the fast failover feature on all SFP uplink module VCPs in a ring:

```
[edit]
user@switch# delete virtual-chassis fast-failover ge
```

Disabling Split and Merge in a Virtual Chassis Configuration (CLI Procedure)

The split and merge feature is enabled by default on J-EX4200 switches in a Virtual Chassis configuration. You can disable the split and merge feature using the **set virtual-chassis no-split-detection** command. If you disable the split and merge feature and the Virtual Chassis configuration splits, both parts of the split Virtual Chassis configuration remain active.

In a preprovisioned Virtual Chassis configuration, if both of the Routing Engines end up in the same Virtual Chassis configuration after a split, the other split Virtual Chassis configuration remains inactive. If the Routing Engines end up in different parts of the split Virtual Chassis configuration and the rest of the member switches are configured as having linecard roles, then a backup Routing Engine might not be selected for either part.

To disable the split and merge feature in a Virtual Chassis configuration:

```
[edit]
user@switch# set virtual-chassis no-split-detection
```

Related Documentation

- Understanding Virtual Chassis Configuration on page 704

Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure)

Every Virtual Chassis configuration has a unique ID that is automatically assigned when the Virtual Chassis configuration is formed. You can also explicitly assign a Virtual Chassis ID using the **set virtual-chassis id** command. When two Virtual Chassis configurations attempt to merge, the Virtual Chassis ID that you assigned takes precedence over the automatically assigned Virtual Chassis IDs and becomes the ID for the newly merged Virtual Chassis configuration.

To configure the Virtual Chassis ID:

```
[edit]
user@switch# set virtual-chassis id id
```

Related Documentation

Configuring Automatic Software Update on Virtual Chassis Member Switches (CLI Procedure)

The automatic software update feature allows you to automatically update the software version on prospective member switches as they are added so that they can join a Virtual Chassis configuration.

Before you begin, ensure that you know the name or the URL of the software package to be used by the automatic software update feature.

To configure the automatic software update feature:

```
[edit]
user@switch# set virtual-chassis auto-sw-update package-name package-name
```

If the software package is located on a local directory on the switch, use the following format for ***package-name***:

/pathname/package-name

If the software package is to be downloaded and installed from a remote location, use one of the following formats:

ftp://*hostname/pathname/package-name*

ftp://*username*:*prompt*@ftp.*hostname.net/package-name*

http://*hostname/pathname/package-name*

Related Documentation

- Example: Configuring Automatic Software Update on Virtual Chassis Member Switches on page 777
- Understanding Automatic Software Update on Virtual Chassis Member Switches on page 715

Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)

In a Virtual Chassis configuration, one member switch is assigned the master role and has the master Rouing Engine. Another member switch is assigned the backup role and has the backup Routing Engine. Graceful Routing Engine switchover (GRES) enables the master and backup Routing Engines in a Virtual Chassis configuration to switch from the master to backup without interruption to packet forwarding. When you configure graceful Routing Engine switchover, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and the forwarding state.

To set up a Virtual Chassis configuration to use graceful Routing Engine switchover (GRES):

1. Set up a minimum of two J-EX4200 switches in a Virtual Chassis configuration with mastership priority of 255:

```
[edit]
user@switch# set virtual-chassis member 0 mastership-priority 255

[edit]
user@switch# set virtual-chassis member 1 mastership-priority 255
```

2. Set up graceful Routing Engine switchover:

```
[edit]
user@switch# set chassis redundancy graceful-switchover
```

Commit the configuration.

CHAPTER 46

Verifying Virtual Chassis Configuration

Command Forwarding Usage with a Virtual Chassis Configuration

Some CLI commands can be run either on all members or on a specific member of a Virtual Chassis configuration. This functionality is referred to as command forwarding.

For example, to collect information about your system prior to contacting Dell Support (see "Requesting Technical Support" on page lxxi), use the command **request support information all-members** to gather data for all the member switches. If you want to gather this data only for a particular member switch, use the command **request support information member** ***member-id*** .

Table 108 on page 804 provides a list of commands that can be run either on all members of the Virtual Chassis configuration or on a specific member switch.

Table 108: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration

Commands Available for Command Forwarding	Purpose	all-members	member-*member-id*
request support information	Use this command when you contact Dell Support about your component problem. This command is the equivalent of using the following CLI commands: • **show version** • **show chassis firmware** • **show chassis hardware** • **show chassis environment** • **show interfaces extensive** (for each configured interface) • **show configuration** (excluding any SECRET-DATA) • **show system virtual-memory**	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
request system partition hard-disk	Set up the hard disk for partitioning. After this command is issued, the hard disk is partitioned the next time the system is rebooted. When the hard disk is partitioned, the contents of **/altroot** and **/altconfig** are saved and restored. All other data on the hard disk is at risk of being lost.	Partitions the hard disk on all members of the Virtual Chassis configuration.	Partitions the hard disk on the specified member switch.
request system reboot	Reboot the Junos OS for J-EX Series switches after a software upgrade and occasionally to recover from an error condition.	Reboots all members of the Virtual Chassis configuration.	Reboots the specified member switch.
request system snapshot	Back up the currently running and active file system.	Backs up the file systems on all members of the Virtual Chassis configuration.	Backs up the file system on the specified member switch.
request system storage cleanup	Free storage space on the switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion.	Runs cleanup on all members of the Virtual Chassis configuration.	Runs cleanup on the specified member switch.
show log user	Display users who are viewing the system log.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.

Table 108: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration *(continued)*

Commands Available for Command Forwarding	Purpose	all-members	member-*member-id*
show system alarms	Display active system alarms.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system audit	Display the state and checksum values for file systems.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system boot-messages	Display initial messages generated by the system kernel upon startup. These messages are the contents of **/var/run/dmesg.boot**.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system core-dumps	Display a core file generated by an internal Junos OS process.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system directory-usage	Display directory usage information.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system reboot	Display pending system reboots or halts.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system snapshot	Display information about the backup software that is located in the **/altroot** and **/altconfig** file systems. To back up software, use the request system snapshot command.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system software	Display the Junos OS extensions loaded on your switch.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system statistics	Display systemwide protocol-related statistics.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system storage	Display statistics about the amount of free disk space in the switch's file systems.	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.

Table 108: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration *(continued)*

Commands Available for Command Forwarding	Purpose	all-members	member-*member-id*
show system uptime	Display the current time and information about how long the switch, the switch software, and any existing protocols have been running	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.
show system users	Show all users who are currently logged in.	Shows all users who are currently logged in to any members of the Virtual Chassis configuration.	Shows all users who are currently logged in to the specified member switch.
show system virtual-memory	Display the usage of the Junos OS kernel memory, listed first by size of allocation and then by type of usage. Use **show system virtual-memory** for troubleshooting with Dell Support (see "Requesting Technical Support" on page lxxi).	Displays information for all members of the Virtual Chassis configuration.	Displays information for the specified member switch.

Table 109 on page 806 shows a list of commands that are relevant only to the master. Do not use the options **all-members** or **member-*member-id*** with these commands.

Table 109: Commands Relevant Only to the Master

Commands Relevant Only to the Master	Purpose
set date	Set the data and time.
show system buffers	Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).
show system connections	Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and which connections are currently in progress.
show system processes	Display information about software processes that are running on the switch and that have controlling terminals.

Verifying the Member ID, Role, and Neighbor Member Connections of a Virtual Chassis Member

Purpose You can designate the role that a member performs within a Virtual Chassis configuration or you can allow the role to be assigned by default. You can designate the member ID that is assigned to a specific switch by creating a permanent association between the switch's serial number and a member ID, using a preprovisioned configuration. Or you can let the member ID be assigned by the master, based on the sequence in which the member switch is powered on and on which member IDs are currently available.

The role and member ID of the member switch are displayed on the front-panel LCD.

Each member switch can be cabled to one or two other member switches, using either the dedicated Virtual Chassis ports (VCPs) on the rear panel, an uplink module port that has been configured as a VCP, or an SFP network port on a J-EX4200-24F switch that has been configured as a VCP. The members that are cabled together are considered neighbor members.

Action To display the role and member ID assignments using the CLI, use the **show virtual-chassis status** command:

```
user@SWA-0> show virtual-chassis status

Virtual Chassis ID: 0000.e255.00e0

                                          Mastership            Neighbor List
Member ID  Status  Serial No   Model     Priority  Role        ID, Interface

0 (FPC 0)  Prsnt   abc123      ex4200-48t    255  Master*     1 vcp-0
                                                              2 vcp-1

1 (FPC 1)  Prsnt   def456      ex4200-24t    255  Backup      2 vcp-0
                                                              0 vcp-1

2 (FPC 2)  Prsnt   abd231      ex4200-24t    128  Linecard    0 vcp-0
                                                              1 vcp-1
```

Meaning This output verifies that three J-EX4200 switches have been interconnected as a Virtual Chassis configuration using their dedicated VCPs . The display shows which of the VCPs is connected to which neighbor. The first port (**vcp-0**) of member **0** is connected to member **1** and the second port of member **0** (**vcp-1**) is connected to member **2**. The FPC slots for J-EX Series switches are the same as the member IDs.

The **Mastership Priority** values indicate that the master and backup members have been explicitly configured, because they are not using the default value (**128**).

Verifying That the Virtual Chassis Ports Are Operational

Purpose Use the **show virtual-chassis vc-port** command to display the status of Virtual Chassis ports (VCPs).

NOTE: The interfaces for VCPs are not displayed when you issue the **show interfaces ge-** command.

Action Display the VCPs:

```
user@SWA-0> show virtual-chassis vc-port all-members

fpc0:
--------------------------------------------------------------------------
Interface   Type              Trunk  Status       Speed        Neighbor
or                             ID                (mbps)       ID  Interface
PIC / Port
vcp-0       Dedicated           1    Up           32000        1   vcp-0

or                             ID                (mbps)       ID  Interface
PIC / Port
vcp-0       Dedicated           1    Up           32000        3   vcp-0
vcp-1       Dedicated           2    Up           32000        3   vcp-1
1/0         Configured          3    Up           1000         0   vcp-255/1/0
1/1         Configured          3    Up           1000         0   vcp-255/1/1
1/2                            -1    Down         1000
1/3                            -1    Down         1000
```

```
fpc3:
--------------------------------------------------------------------------
Interface   Type              Trunk  Status       Speed        Neighbor
or                             ID                (mbps)       ID  Interface
PIC / Port
vcp-0       Dedicated           1    Up           32000        2   vcp-0
vcp-1       Dedicated           2    Up           32000        2   vcp-1
1/0         Configured          3    Up           10000        1   vcp-255/1/0
1/1         Configured          3    Up           10000        1   vcp-255/1/1

fpc4:
--------------------------------------------------------------------------
Interface   Type              Trunk  Status       Speed        Neighbor
or                             ID                (mbps)       ID  Interface
PIC / Port
vcp-0       Dedicated           1    Down         32000
vcp-1       Dedicated           2    Down         32000
0/20        Configured          3    Up           1000         0   vcp-255/1/2
0/21        Configured          3    Up           1000         0   vcp-255/1/3
```

Meaning The dedicated VCPs are displayed as **vcp-0** and **vcp-1**. The uplink module interfaces that have been set as uplink VCPs are displayed as **1/0**, **1/1**, **1/2**, and **1/3**. The J-EX4200-24F network interfaces that have been set as VCPs are displayed as **0/20** and **0/21**. The neighbor interface names of uplink and network VCPs are of the form **vcp-255/*pic/port***—for example, **vcp-255/1/0**. In that name, **vcp-255** indicates that the interface is a VCP, **1** is the uplink PIC number, and **0** is the port number. The **fpc** number is the same as the member ID. The trunk ID is a positive number ID assigned to the LAG formed by the Virtual Chassis. If no LAG is formed, the value is **–1**.

Related Documentation

- Monitoring Virtual Chassis Configuration Status and Statistics on page 809

Monitoring Virtual Chassis Configuration Status and Statistics

Purpose Use the monitoring functionality to view the following information about Virtual Chassis members and ports:

- Member details and how members are connected with each other.
- Traffic statistics for Virtual Chassis ports of the selected members.
- Details of the Virtual Chassis port packet counters.

Action To view Virtual Chassis monitoring details in the J-Web interface, select **Monitor > Virtual Chassis**.

To view member details for all members in the CLI, enter the following command:

show virtual-chassis status

To view Virtual Chassis port traffic statistics for a specific member in the CLI, enter the following command:

show virtual-chassis vc-port statistics member ***member-id***

To view the path a packet takes when going from a source interface to a destination interface in a Virtual Chassis configuration using the CLI, enter the following command:

show virtual-chassis vc-path

Meaning In the J-Web interface the top half of the screen displays details of the Virtual Chassis configuration, such as:

- Member
- Role
- Interface
- Type
- Speed
- Neighboring Member ID
- Link Status
- Error count

Click the **Stop** button to stop fetching values from the switch, and click the **Start** button to start plotting data again from the point where it was stopped.

To view a graph of the statistics for the selected Virtual Chassis port of the member, click **Show Graph**.

Refresh Interval (sec)—Displays the time interval you have set for page refresh.

Click **Clear Statistics** to clear the monitoring statistics for the selected member switch. You can specify the interval at which the member details and statistics must be refreshed.

The bottom half of the screen displays a chart of the Virtual Chassis statistics, and the port packet counters.

For details about the output from CLI commands, see **show virtual-chassis status** and **show virtual-chassis vc-port statistics**.

Related Documentation

- Configuring a Virtual Chassis (CLI Procedure) on page 781
- Configuring a Virtual Chassis (J-Web Procedure) on page 784
- Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet on page 717

- Verifying the Member ID, Role, and Neighbor Member Connections of a Virtual Chassis Member on page 807

Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure)

You can replace a member switch of a Virtual Chassis configuration without disrupting network service for the other members. You can retain the existing configuration of the member switch and apply it to a new member switch, or you can free up the member ID and make it available for assignment to a new member switch.

To replace a member switch, use the procedure that matches what you need to accomplish:

- Remove, Repair, and Reinstall the Same Switch on page 811
- Remove a Member Switch, Replace with a Different Switch, and Reapply the Old Configuration on page 812
- Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch on page 812

Remove, Repair, and Reinstall the Same Switch

If you need to repair a member switch, you can remove it from the Virtual Chassis configuration without disrupting network service for the other members. The master stores the configuration of the member ID so that it can be reapplied when the member switch (with the same base MAC address) is reconnected.

1. Power off and disconnect the member switch to be repaired.
2. Repair, as necessary.
3. Reconnect and power on the member switch.

Remove a Member Switch, Replace with a Different Switch, and Reapply the Old Configuration

If you are unable to repair a member switch, you can replace it with a different member switch and retain the old configuration. The master stores the configuration of the member that was removed. When you connect a different member switch, the master assigns a new member ID. But the old configuration is still stored under the previous member ID of the previous member switch.

NOTE: If you have used a preprovisioned configuration, use the replace command to change the serial number in the Virtual Chassis configuration file. Substitute the serial number of the replacement member switch (on the back of the switch) for the serial number of the member switch that was removed.

1. Power off and disconnect the member switch to be replaced.
2. If the replacement member switch has been previously configured, revert that switch's configuration to the factory defaults. See "Reverting to the Default Factory Configuration for the J-EX Series Switch" on page 341.
3. Connect and power on the replacement member switch.
4. Note the member ID displayed on the front panel.
5. Issue the **request virtual-chassis renumber** command from the Virtual Chassis master to change the member switch's current member ID to the member ID that belonged to the member switch that was removed from the Virtual Chassis configuration).

Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch

When you remove a member switch from the Virtual Chassis configuration, the master keeps its member ID on reserve. To make that member switch's member ID available for reassignment, issue the **request virtual-chassis recycle** command from the Virtual Chassis master.

NOTE: When you add or delete members in a Virtual Chassis configuration, internal routing changes might cause temporary traffic loss for a few seconds.

Verifying That Graceful Routing Engine Switchover Is Working in the Virtual Chassis Configuration

Purpose Verify that graceful Routing Engine switchover (GRES) is working in the Virtual Chassis configuration.

Action On the master switch, verify the member ID of the backup Routing Engine:

```
{master:0}
user@switch> show virtual-chassis status
Virtual Chassis ID: 5efa.4b7a.aae6
                                                Mastership            Neighbor List
Member ID  Status   Serial No    Model    priority    Role      ID  Interface
0 (FPC 0)  Prsnt    BM0208105281 ex4200-24t      255  Master*    1  vcp-0
1 (FPC 1)  Prsnt    BP0208192350 ex4200-48t      255  Backup     0  vcp-0

Member ID for next new member: 2 (FPC 2)
```

Connect to the backup Routing Engine:

```
{master:0}
user@switch> request session member 1

{backup:1}
user@switch>
```

Verify that the backup Routing Engine is ready for switchover on member ID 1:

```
{backup:1}
user@switch> show system switchover

Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady State
```

Switch the current backup Routing Engine to master Routing Engine:

NOTE: You must wait a minimum of 2 minutes between Routing Engine failovers for the Routing Engines to synchronize.

```
{backup:1}
user@switch> request chassis routing-engine master acquire
```

Verify that the master and backup Routing Engines have switched roles:

NOTE: Member ID 1 is now the master, and member ID 0 is now the backup.

```
{master:1}
user@switch> show virtual-chassis status

Virtual Chassis ID: 5efa.4b7a.aae6
```

```
                                              Mastership            Neighbor List
Member ID  Status   Serial No    Model    priority    Role      ID  Interface
0 (FPC 0)  Prsnt    BM0208105281 ex4200-24t      255  Backup     1  vcp-0
1 (FPC 1)  Prsnt    BP0208192350 ex4200-48t      255  Master*    0  vcp-0

Member ID for next new member: 2 (FPC 2)
```

Meaning With graceful Routing Engine switchover enabled, when you initiated a switchover from the backup Routing Engine, the backup Routing Engine became the master and the master Routing Engine became the backup.

CHAPTER 47

Troubleshooting Virtual Chassis

Troubleshooting a Virtual Chassis Configuration

Clear Virtual Chassis NotPrsnt Status and Make Member ID Available for Reassignment

Problem You disconnected a J-EX4200 from the Virtual Chassis configuration, but the disconnected switch's member ID is still displayed in the status output. You cannot reassign that member ID to another switch.

Solution When you disconnect a member of a Virtual Chassis configuration, the master retains the member ID and member configuration in its configuration database. The **show virtual-chassis status** command continues to display the member ID of the disconnected member with a status of **NotPrsnt**.

If want to permanently disconnect the member switch, you can free up the member ID by using the **request virtual-chassis recycle** command. This will also clear the status of that member.

Load Factory Default Does Not Commit on a Multimember Virtual Chassis

Problem The load factory default command fails on a multimember Virtual Chassis configuration.

Solution The **load factory default** command is not supported on a multimember Virtual Chassis configuration. For information on how to revert to factory default settings, see "Reverting to the Default Factory Configuration for the J-EX Series Switch" on page 341.

Member ID Persists When a Member Switch Is Disconnected From a Virtual Chassis

Problem Gigabit Ethernet interfaces retain their previous slot numbers when a member switch is disconnected from the Virtual Chassis configuration.

Solution

If a switch had been previously connected as a member of a Virtual Chassis configuration, it retains the member ID that it was assigned as a member of that configuration even after it is disconnected and operating as a standalone switch. The interfaces that were configured while the switch was a member of the Virtual Chassis configuration retain the old member ID as the first digit of the interface name.

For example, if the switch was previously member **1**, its interfaces are named **ge-1/0/0** and so on.

To change the switch's member ID, so that its member ID is **0**, and to rename the switch's interfaces accordingly, enter the following operational-mode commands:

1. To change the member ID to 0:

```
user@switch> request virtual-chassis renumber member-id 1 new-member-id 0
```

2. To rename the interfaces to match the new member ID:

```
user@switch# replace pattern ge-1/ with ge-0/
```

CHAPTER 48

Configuration Statements for Virtual Chassis

[edit virtual-chassis] Configuration Statement Hierarchy

```
virtual-chassis {
  auto-sw-update {
    package-name-edit-virtual-chassis.xml package-name;
  }
  fast-failover (ge | vcp disable | xe);
  id id;
  mac-persistence-timer seconds;
  member member-id {
    mastership-priority number;
    no-management-vlan;
    serial-number;
    role;
  }
  no-split-detection;
  preprovisioned;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
      regex>;
    flag flag ;
  }
}
```

Related Documentation

- Virtual Chassis Overview on page 691

auto-sw-update

Syntax

```
auto-sw-update {
  package-name package-name;
}
```

Hierarchy Level [edit virtual-chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the automatic software update feature for Virtual Chassis configurations.

The remaining statement is explained separately.

Default The automatic software update feature is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Automatic Software Update on Virtual Chassis Member Switches on page 777
- Configuring Automatic Software Update on Virtual Chassis Member Switches (CLI Procedure) on page 800

fast-failover

Syntax fast-failover (ge | vcp disable | xe);

Hierarchy Level [edit virtual-chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the fast failover feature on all SFP uplink module Virtual Chassis ports (VCPs) or disable the fast failover feature on all dedicated VCPs in a ring topology.

Default Fast failover is enabled on dedicated VCPs; it is not enabled on uplink module VCPs.

Options

- **ge**—Enable fast failover on all Gigabit Ethernet uplink module VCPs in the ring.
- **vcp disable**—Disable fast failover on all dedicated VCPs in the ring.
- **xe**—Enable fast failover on all 10-Gigabit Ethernet uplink module VCPs in the ring.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Fast Failover on Uplink Module VCPs to Reroute Traffic When a Virtual Chassis Member Switch or Inter-Member Link Fails on page 763
- Configuring Fast Failover in a Virtual Chassis Configuration on page 798
- Disabling Fast Failover in a Virtual Chassis Configuration on page 799

graceful-switchover

Syntax graceful-switchover;

Hierarchy Level [edit **chassis redundancy**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For switches with more than one Routing Engine, including those in a Virtual Chassis, configure the master Routing Engine to switch over gracefully to a backup Routing Engine without interruption to packet forwarding.

Default Graceful Routing Engine switchover (GRES) is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Nonstop Active Routing on J-EX Series Switches
- Configuring Graceful Routing Engine Switchover in a J-EX4200 Virtual Chassis (CLI Procedure) on page 801
- Configuring Nonstop Active Routing on J-EX Series Switches (CLI Procedure)
- Installing Software on a J-EX8200 Switch with Redundant Routing Engines (CLI Procedure) on page 71

id

Syntax id *id*;

Hierarchy Level [edit **virtual-chassis**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the alphanumeric string that identifies a Virtual Chassis configuration.

Options *id*—ID of the Virtual Chassis configuration, which uses the ISO family address format—for example, **9622.6ac8.5345**.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge on page 767
- Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure) on page 800
- Understanding Split and Merge in a Virtual Chassis Configuration on page 712

mac-persistence-timer

Syntax mac-persistence-timer *minutes*;

Hierarchy Level [edit virtual-chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description If the master is physically disconnected or removed from the Virtual Chassis configuration, the MAC persistence timer determines how long the backup (new master) continues to use the address of the old master. When the MAC persistence timer expires, the backup (new master) begins to use its own MAC address.

There are no minimum or maximum timer limits.

Default 10 minutes

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as Master of Virtual Chassis (CLI Procedure) on page 797
- Understanding Virtual Chassis Components on page 694

mastership-priority

Syntax mastership-priority *number* ;

Hierarchy Level [edit **virtual-chassis member** *member-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description The mastership priority value is the most important factor in determining the role of the J-EX4200 member switch within the Virtual Chassis configuration. Other factors (see "Understanding How the Master in a Virtual Chassis Configuration Is Elected" on page 698) also affect the election of the master.

The mastership priority value takes the highest precedence in the master election algorithm. The member switch with highest mastership priority becomes the master of the Virtual Chassis configuration. Toggling back and forth between master and backup status in failover conditions is undesirable, so we recommend that you assign the same mastership priority value to both the master and the backup. Secondary factors in the master election algorithm determine which of these two members (that is, the two members that are assigned the highest mastership priority value) functions as the master of the Virtual Chassis configuration.

Default 128

Options *number*—Mastership priority value.
Range: 1 through 255

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet on page 717
- Example: Configuring a Virtual Chassis Interconnected Across Multiple Wiring Closets on page 733
- Configuring a Virtual Chassis (CLI Procedure) on page 781
- Configuring a Virtual Chassis (J-Web Procedure) on page 784
- Understanding Virtual Chassis Components on page 694

member

Syntax

```
member member-id {
  mastership-priority number;
  no-management-vlan;
  serial-number;
  role;
}
```

Hierarchy Level [edit virtual-chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a J-EX4200 switch as a member of a Virtual Chassis configuration.

Default When a J-EX4200 is powered on as a standalone switch (not interconnected through its Virtual Chassis ports with other J-EX4200 switches), its default member ID is **0**.

Options *member-id*—Identifies a specific member switch of a Virtual Chassis configuration.

Range: 0 through 9

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring a Virtual Chassis Using a Preprovisioned Configuration File on page 752
- Configuring a Virtual Chassis (CLI Procedure) on page 781
- Configuring a Virtual Chassis (J-Web Procedure) on page 784
- Understanding Virtual Chassis Components on page 694

no-management-vlan

Syntax no-management-vlan;

Hierarchy Level [edit **virtual-chassis member** *member-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Remove the specified member's out-of-band management port from the Virtual Management Ethernet (VME) global management VLAN of the Virtual Chassis configuration.

For a member that is functioning in a linecard role, you can use this configuration to reserve the member's management Ethernet port for local troubleshooting:

```
virtual-chassis {
  member 2 {
    no-management-vlan;
    }
  }
```

You cannot configure the IP address for a local management Ethernet port using the CLI or the J-Web interface. To do this, you need to use the shell **ifconfig** command.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up a Multimember Virtual Chassis Access Switch with a Default Configuration on page 727
- Configuring the Virtual Management Ethernet Interface for Global Management of a Virtual Chassis (CLI Procedure) on page 797
- Understanding Global Management of a Virtual Chassis Configuration on page 699

no-split-detection

Syntax no-split-detection;

Hierarchy Level [edit virtual-chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the split and merge feature in a Virtual Chassis configuration. The split and merge feature is enabled by default on J-EX4200 switches.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge on page 767
- Disabling Split and Merge in a Virtual Chassis Configuration (CLI Procedure) on page 799
- Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure) on page 800
- Understanding Split and Merge in a Virtual Chassis Configuration on page 712

package-name

Syntax package-name *package-name*;

Hierarchy Level [edit virtual-chassis **auto-sw-update**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the software package name or location of the software package to be used by the automatic software update feature for Virtual Chassis configurations.

Default No package name is specified.

Options ***package-name***—Name of the software package or the URL to the software package to be used.

- If the software package is located on a local directory on the switch, use the following format for ***package-name***:

  /pathname/package-name

- If the software package is to be downloaded and installed from a remote location, use one of the following formats:

  ftp:*//hostname/pathname/package-name*

  ftp:*//username*:*prompt*@ftp.*hostname.net/package-name*

  http:*//hostname/pathname/package-name*

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Automatic Software Update on Virtual Chassis Member Switches on page 777
- Configuring Automatic Software Update on Virtual Chassis Member Switches (CLI Procedure) on page 800

preprovisioned

Syntax preprovisioned;

Hierarchy Level [edit virtual-chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the preprovisioned configuration mode for a Virtual Chassis configuration.

When preprovisioned configuration mode is enabled, you cannot use the CLI or the J-Web interface to change the mastership priority or member ID of member switches.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring a Virtual Chassis Using a Preprovisioned Configuration File on page 752
- Configuring a Virtual Chassis (CLI Procedure) on page 781
- Configuring a Virtual Chassis (J-Web Procedure) on page 784

- Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 811
- Understanding Virtual Chassis Configuration on page 704

redundancy (Graceful Switchover)

Syntax

```
redundancy {
  graceful-switchover;
}
```

Hierarchy Level [edit chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For J-EX4200 switches configured as a Virtual Chassis and for J-EX8200 switches with more than one Routing Engine, enable redundant Routing Engines.

The remaining statement is explained separately.

Default Redundancy is enabled for the Routing Engines.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Graceful Routing Engine Switchover in a J-EX4200 Virtual Chassis (CLI Procedure) on page 801
- Installing Software on a J-EX8200 Switch with Redundant Routing Engines (CLI Procedure) on page 71

role

Syntax role (routing-engine | line-card);

Hierarchy Level [edit **virtual-chassis preprovisioned member** *member-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description In a preprovisioned Virtual Chassis configuration, specify the role to be performed by each J-EX4200 member switch. Associate the role permanently with the member's serial number.

Options **routing-engine**—Enables the member eligible to function as a master or backup of the Virtual Chassis configuration. The master manages all the members of the Virtual Chassis configuration and runs the chassis management processes and control protocols. The backup synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

Specify two and only two members as routing-engine. The software determines which of the two members assigned the routing-engine role functions as master, based on the master election algorithm. See "Understanding How the Master in a Virtual Chassis Configuration Is Elected" on page 698.

line-card—Enables the member to be eligible to function only in the linecard role. Any member of the Virtual Chassis configuration other than the master or backup functions in the linecard role and runs only a subset of the Junos OS for J-EX Series switches. A member functioning in the linecard role does not run the chassis control protocols. A Virtual Chassis configuration must have at least three members in order to include a member that functions in the linecard role.

When you use a preprovisioned configuration, you cannot modify the mastership priority or member ID of member switches through the user interfaces. The mastership priority value is generated by the software, based on the assigned role:

- A member configured as **routing-engine** is assigned the mastership priority **129**.
- A member configured as **line-card** is assigned the mastership priority **0**.
- A member listed in the preprovisioned configuration without an explicitly specified role is assigned the mastership priority **128**.

The configured role specifications are permanent. If both **routing-engine** members should fail, a **line-card** member cannot take over as master of the Virtual Chassis configuration. You must delete the preprovisioned configuration in order to change the specified roles.

It is possible to explicitly configure two members as **routing-engine** and to configure additional switches as members of the preprovisioned Virtual Chassis by specifying only their serial numbers. If you do not explicitly configure the role of the additional

members, they function in a linecard role by default. In that case, a member that is functioning in a linecard role can take over mastership if the members functioning as master and backup (routing-engine role) both fail.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Adding a New Switch to an Existing Virtual Chassis Configuration (CLI Procedure) on page 786
- Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 811
- Understanding Virtual Chassis Configuration on page 704

serial-number

Syntax serial-number *serial-number*;

Hierarchy Level [edit **virtual-chassis preprovisioned member** *member-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description In a preprovisioned Virtual Chassis configuration, specify the serial number of each J-EX4200 member switch to be included in the Virtual Chassis configuration. If you do not include the serial number within the Virtual Chassis configuration, the switch cannot be recognized as a member of a preprovisioned configuration.

Options **serial-number**—The switch's permanent serial number, which is located on the back of the switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring a Virtual Chassis Using a Preprovisioned Configuration File on page 752
- Configuring a Virtual Chassis (CLI Procedure) on page 781
- Configuring a Virtual Chassis (J-Web Procedure) on page 784
- Adding a New Switch to an Existing Virtual Chassis Configuration (CLI Procedure) on page 786
- Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 811
- Understanding Virtual Chassis Configuration on page 704

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <no-stamp> <replace> <size size> <world-readable |
    no-world-readable>;
  flag flag <detail> <disable> <receive> <send>;
}
```

Hierarchy Level [edit virtual-chassis]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define tracing operations for the Virtual Chassis configuration.

Default Tracing operations are disabled.

Options **detail**—(Optional) Generate detailed trace information for a flag.

disable—(Optional) Disable a flag.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.

TIP: The all flag displays a subset of logs that are useful in debugging most issues. For more detailed information, use all detail.

- **auto-configuration**—Trace Virtual Chassis ports (VCPs) that have been automatically configured.
- **csn**—Trace Virtual Chassis complete sequence number (CSN) packets.
- **error**—Trace Virtual Chassis errored packets.
- **hello**—Trace Virtual Chassis hello packets.
- **krt**—Trace Virtual Chassis KRT events.
- **lsp**—Trace Virtual Chassis link-state packets.

- **lsp-generation**—Trace Virtual Chassis link-state packet generation.
- **me**—Trace Virtual Chassis ME events.
- **normal**—Trace normal events.
- **packets**—Trace Virtual Chassis packets.
- **parse**—Trace reading of the configuration.
- **psn**—Trace partial sequence number (PSN) packets.
- **route**—Trace Virtual Chassis routing information.
- **spf**—Trace Virtual Chassis SPF events.
- **state**—Trace Virtual Chassis state transitions.
- **task**—Trace Virtual Chassis task operations.

no-stamp—(Optional) Do not place a timestamp on any trace file.

no-world-readable—(Optional) Restrict file access to the user who created the file.

receive—(Optional) Trace received packets.

replace—(Optional) Replace a trace file rather than appending information to it.

send—(Optional) Trace transmitted packets.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

virtual-chassis

Syntax

```
virtual-chassis {
  auto-sw-upgrade {
    package-name-edit-virtual-chassis.xml package-name;
  }
  fast-failover (ge | vcp disable | xe);
  id id;
  mac-persistence-timer seconds;
  member member-id {
    mastership-priority number;
    no-management-vlan;
    serial-number;
    role;
  }
  no-split-detection;
  preprovisioned;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
      regex>;
    flag flag ;
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Virtual Chassis information on a J-EX4200 switch.

The remaining statements are explained separately.

Default A standalone J-EX4200 switch is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

CHAPTER 49

Operational Mode Commands for Virtual Chassis

clear virtual-chassis vc-port statistics

Syntax

clear virtual-chassis vc-port statistics
<all-members>
<*interface-name*>
<local>
<member *member-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear—reset to zero (0)—the traffic statistics counters on Virtual Chassis ports (VCPs).

Options

none—Clear traffic statistics for the VCPs of all members of a Virtual Chassis configuration.

all-members—(Optional) Clear traffic statistics for the VCPs of all members of a Virtual Chassis configuration.

interface-name—(Optional) Name of the VCP interface to be cleared of its traffic statistics. Specify either **vcp-0** or **vcp-1**.

local—(Optional) Clear VCP traffic statistics from only the switch on which this command is entered.

member *member-id*—(Optional) Clear VCP traffic statistics from only the specified member of a Virtual Chassis configuration.

Required Privilege Level

clear

Related Documentation

- **show virtual-chassis vc-port statistics on page 854**
- **show virtual-chassis vc-port on page 851**
- Monitoring Virtual Chassis Configuration Status and Statistics on page 809
- Understanding Virtual Chassis Components on page 694

List of Sample Output

clear virtual-chassis vc-port statistics on page 836
clear virtual-chassis vc-port statistics member 3 on page 836

clear virtual-chassis vc-port statistics

```
user@SWA-0> clear virtual-chassis vc-port statistics
fpc0:
--------------------------------------------------------------------------
Statistics cleared

{master:0}
```

clear virtual-chassis vc-port statistics member 3

```
user@SWA-0> clear virtual-chassis vc-port statistics member 3
Cleared statistics on member 3
```

request session member

Syntax **request session member *member-id***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Starts a session with the specified member of a Virtual Chassis configuration.

Options ***member-id***—Select the specific member of the Virtual Chassis configuration with which you want to establish a session.

Required Privilege Level maintenance

Related Documentation

- **member on page 823**
- Understanding Virtual Chassis Components on page 694

request virtual-chassis recycle

Syntax **request virtual-chassis recycle member-id *member-id***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Make a previously used member ID available for reassignment.

When you remove a member switch from the Virtual Chassis configuration, the master reserves that member ID. To make the member ID available for reassignment, you must use this command.

NOTE: You can run this command from the Virtual Chassis master only.

Options member-id *member-id*—Specify the member id that you want to make available for reassignment to a different member switch.

Required Privilege Level system-control

Related Documentation

- **request virtual-chassis renumber on page 839**
- Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 811

List of Sample Output **request virtual-chassis recycle member-id 3 on page 838**

request virtual-chassis recycle member-id 3

```
user@host> request virtual-chassis recycle member-id 3
```

request virtual-chassis renumber

Syntax request virtual-chassis renumber member-id *old-member-id* new-member-id *new-member-id*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Renumber a member of a Virtual Chassis configuration.

NOTE: You can run this command from the Virtual Chassis master only.

Options member-id *old-member-id*—Specify the ID of the member that you wish to renumber.

new-member-id *new-member-id*—Specify an unassigned member ID (from 0 through 9).

Required Privilege Level system-control

Related Documentation

- **request virtual-chassis recycle on page 838**
- Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure) on page 811

List of Sample Output **request virtual-chassis renumber member-id 5 new-member-id 4 on page 839**

request virtual-chassis renumber member-id 5 new-member-id 4

```
user@SWA-0> request virtual-chassis renumber member-id 5 new-member-id 4
```

request virtual-chassis vc-port

Syntax **request virtual-chassis vc-port set | delete pic-slot** *pic-slot* **port** *port-number* **<member** *member-id***>**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable or disable an uplink module port (on an SFP or SFP+ uplink module) or an SFP network port on a J-EX4200-24F switch as a Virtual Chassis port (VCP).

Options

pic-slot *pic-slot*—Number of the PIC slot for the uplink module port or SFP network port on a J-EX4200-24F switch. Specify **1** to represent the uplink module PIC on the J-EX Series switch. Specify **0** to represent the SFP network port on a J-EX4200-24F switch.

port *port-number*—Number of the uplink module port (**0** or **1**) or SFP network port on a J-EX4200-24F switch (**0** to **23**) that is to be enabled or disabled as a VCP.

member *member-id*—(Optional) Enable or disable the specified VCP on the specified member of the Virtual Chassis configuration.

Additional Information If you omit **member** ***member-id***, this command defaults to enabling or disabling the uplink VCP or SFP network port configured as a VCP on the switch where the command is issued.

Required Privilege Level system-control

List of Sample Output

request virtual-chassis vc-port set pic-slot 1 port 0 on page 840
request virtual-chassis vc-port set pic-slot 1 port 1 member 3 on page 840
request virtual-chassis vc-port delete pic-slot 1 port 1 member 3 on page 840

request virtual-chassis vc-port set pic-slot 1 port 0

```
user@host>request virtual-chassis vc-port set pic-slot 1 port 0
```

To check the results of this command, use the **show virtual-chassis vc-port** command.

request virtual-chassis vc-port set pic-slot 1 port 1 member 3

```
user@host>request virtual-chassis vc-port set pic-slot 1 port 1 member 3
```

To check the results of this command, use the **show virtual-chassis vc-port** command.

request virtual-chassis vc-port delete pic-slot 1 port 1 member 3

```
user@host>request virtual-chassis vc-port delete pic-slot 1 port 1 member 3
```

To check the results of this command, use the **show virtual-chassis vc-port** command.

request virtual-chassis vc-port

Syntax **request virtual-chassis vc-port set interface *vcp-interface-name*** **<member *member-id*> <disable>**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable or enable a Virtual Chassis port (VCP) for a dedicated VCP on the rear panel of the Virtual Chassis.

Options

interface *vcp-interface-name* —Name of the interface to enable or disable. Specify either **vcp-0** or **vcp-1**.

member *member-id* —(Optional) Enable or disable the specified VCP on the specified member of the Virtual Chassis configuration.

disable —(Optional) Disable the specified VCP. If you omit this keyword, the command enables the dedicated VCP.

Additional Information If you omit **member *member-id***, this command defaults to disabling or enabling the dedicated VCP on the switch where the command is issued. The dedicated VCPs are enabled in the factory default configuration.

Required Privilege Level system-control

List of Sample Output

request virtual-chassis vc-port set interface vcp-0 disable on page 841
request virtual-chassis vc-port set interface vcp-0 member 3 disable on page 841

request virtual-chassis vc-port set interface vcp-0 disable

```
user@host> request virtual-chassis vc-port set interface vcp-0 disable
```

To check the results of this command, use the **show virtual-chassis vc-port** command.

request virtual-chassis vc-port set interface vcp-0 member 3 disable

```
user@host> request virtual-chassis vc-port set interface vcp-0 member 3 disable
```

To check the results of this command, use the **show virtual-chassis vc-port** command.

show system uptime

Syntax **show system uptime (all-members | member *member-id)***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the current time and information about how long the Virtual Chassis, Virtual Chassis software, and routing protocols have been running.

Options

all-members—Display the current time and information about how long the Virtual Chassis, Virtual Chassis software, and routing protocols have been running for all the member switches of the Virtual Chassis configuration.

member *member-id*—Display the current time and information about how long the Virtual Chassis, Virtual Chassis software, and routing protocols have been running for the specific member of the Virtual Chassis configuration.

Required Privilege Level view

List of Sample Output **show system uptime member 0 on page 843**

Output Fields Table 110 on page 842 lists the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

Table 110: show system uptime Output Fields

Field Name	Field Description
Current time	Current system time in UTC.
System booted	Date and time when the switch was last booted and how long it has been running.
Protocols started	Date and time when the routing protocols were last started and how long they have been running.
Last configured	Date and time when a configuration was last committed. Also shows the name of the user who issued the last commit command.
Time and up	Current time, in the local time zone, and how long the switch has been operational.
Users	Number of users logged into the switch.

Table 110: show system uptime Output Fields *(continued)*

Field Name	Field Description
Load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

show system uptime member 0

```
user@host>show system uptime member 0
fpc0:
--------------------------------------------------------------------------
Current time: 2008-02-06 05:24:20 UTC
System booted: 2008-01-31 08:26:54 UTC (5d 20:57 ago)
Protocols started: 2008-01-31 08:27:56 UTC (5d 20:56 ago)
Last configured: 2008-02-05 03:26:43 UTC (1d 01:57 ago) by root
 5:24AM  up 5 days, 20:57, 1 user, load averages: 0.14, 0.06, 0.01
```

show virtual-chassis active topology

Syntax **show virtual-chassis active-topology**
<(all-members | member *member-id*)>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display the active topology of the Virtual Chassis configuration with reachability information.

Options none—Display the active topology of the member switch where the command is issued.

all-members—Display the active topology of all members of the Virtual Chassis configuration.

member *member-id*—Display the active topology of a specified member of the Virtual Chassis configuration.

Required Privilege Level view

List of Sample Output **show virtual-chassis active-topology on page 844**

Output Fields Table 111 on page 844 lists the output fields for the **show virtual-chassis active-topology** command. Output fields are listed in the approximate order in which they appear.

Table 111: show virtual-chassis active-topology Output Fields

Field Name	Field Description
Destination ID	Specifies the member ID of the destination.
Next-hop	Specifies the member ID and VCP of the next-hop to which packets for the destination ID are forwarded.

show virtual-chassis active-topology

```
user@SWA-0> show virtual-chassis active-topology
  1                   1(vcp-1)

  2                   1(vcp-1)

  3                   1(vcp-1)

  4                   1(vcp-1)
```

```
5                   8(vcp-0)  1(vcp-1)

6                   8(vcp-0)

7                   8(vcp-0)

8                   8(vcp-0)
```

show virtual-chassis fast-failover

Syntax **show virtual-chassis fast-failover**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about the fast failover feature in a Virtual Chassis configuration.

Required Privilege Level view

Related Documentation

Output Fields Table 112 on page 846 lists the output fields for the **show virtual-chassis fast-failover** command. Output fields are listed in the approximate order in which they appear.

Table 112: show virtual-chassis fast-failover Output Fields

Field Name	Field Description
Fast failover on dedicated VCP ports	Indicates fast failover status on dedicated VCPs.
Fast failover on XE uplink VCP ports	Indicates fast failover status on XFP uplink module VCPs. (Not supported on Dell PowerConnect J-EX Series Switches.)
Fast failover on GE uplink VCP ports	Indicates fast failover status on SFP uplink module VCPs.

show virtual-chassis fast-failover

```
user@switch1> show virtual-chassis fast-failover
Fast failover on dedicated VCP ports: Enabled
Fast failover on XE uplink VCP ports: Disabled
Fast failover on GE uplink VCP ports: Enabled
```

show virtual-chassis status

Syntax **show virtual-chassis status**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about all the members of the Virtual Chassis configuration.

Options none—Display all information for all member switches of the Virtual Chassis configuration.

Required Privilege Level view

Related Documentation

- Understanding Virtual Chassis Configuration on page 704

Output Fields Table 113 on page 847 lists the output fields for the **show virtual-chassis status** command. Output fields are listed in the approximate order in which they appear.

Table 113: show virtual-chassis status Output Fields

Field Name	Field Description
Virtual Chassis ID	Assigned ID that applies to the entire Virtual Chassis configuration.
Member ID	Assigned member ID and FPC slot (from 0 through 9).
Status	For a nonprovisioned configuration: • **Prsnt** for a member that is currently connected to the Virtual Chassis configuration • **NotPrsnt** for a member ID that has been assigned but is not currently connected For a preprovisioned configuration: • **Prsnt** for a member that is specified in the preprovisioned configuration file and is currently connected to the Virtual Chassis configuration. • **Unprvsnd** for a member that is interconnected with the Virtual Chassis configuration, but is not specified in the preprovisioned configuration file.
Serial No	Serial number of the member switch.
Model	Model number of the member switch.
Mastership Priority	Mastership priority value of the member switch.
Role	Role of the member switch.
Neighbor List	Member ID of the neighbor member to which this member's VCP interface is connected.

show virtual-chassis status

```
user@SWA-0> show virtual-chassis status

   Virtual Chassis ID: 0019.e250.47a0
                                                 Mastership            Neighbor List

Member ID for next new member: 9 (FPC 9)
```

show virtual-chassis vc-path

Syntax **show virtual-chassis vc-path source-interface *interface-name* destination-interface *interface-name***

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Show the path a packet takes when going from a source interface to a destination interface in a Virtual Chassis configuration.

Options source-interface *interface-name* —Name of the interface from which the packet originates

destination-interface *interface-name* —Name of the interface to which the packet is delivered

List of Sample Output **show virtual-chassis vc-path source-interface destination-interface on page 849**

Output Fields Table 114 on page 849 lists the output fields for the **show virtual-chassis vc-path** command. Output fields are listed in the approximate order in which they appear.

Table 114: show virtual-chassis vc-path Output Fields

Field Name	Field Description
Hop	The number of hops between the source and destination interfaces.
Member	The Virtual Chassis ID of the member switch that contains the Packet Forwarding Engine for each intermediate hop.
PFE-Device	The number of the Packet Forwarding Engine in each Virtual Chassis member through which a packet passes. Each Packet Forwarding Engine is the next hop of the preceding Packet Forwarding Engine.
Interface	The name of the interface through which the Packet Forwarding Engines are connected. The interface for the first hop is always the source interface and the interface for the last hop is always the destination interface. For intermediate hops, the **Interface** field denotes the Packet Forwarding Engines through which the packet passes on its way to the next hop.

show virtual-chassis vc-path source-interface destination-interface

```
user@switch> show virtual-chassis vc-path source-interface ge-0/0/0 destination-interface
ge-1/0/1
vc-path from ge-0/0/0 to ge-1/0/1
Hop      Member     PFE-Device      Interface
0         0          1              ge-0/0/0
1         0          0              internal-1/24
```

```
2          1          3                vcp-0
3          1          4                ge-1/0/1
```

show virtual-chassis vc-port

Syntax

show virtual-chassis vc-port
<(all-members | member *member-id*)>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the status of the Virtual Chassis ports (VCPs), including both the dedicated VCPs and the uplink module ports configured as VCPs.

Options

none—Display the operational status of all the VCPs of the member switch where the command is issued.

all-members—(Optional) Display the operational status of all the VCPs on all members of the Virtual Chassis configuration.

member *member-id*—(Optional) Display the operational status of all the VCPs for the specified member of the Virtual Chassis configuration.

Required Privilege Level

view

Related Documentation

List of Sample Output

show virtual-chassis vc-port on page 852
show virtual-chassis vc-port all-members on page 852

Output Fields

Table 115 on page 851 lists the output fields for the **show virtual-chassis vc-port** command. Output fields are listed in the approximate order in which they appear.

Table 115: show virtual-chassis vc-port Output Fields

Field Name	Field Description
fpc*number*	The FPC number is the same as the member ID.
Interface or PIC/Port	VCP interface name. Unlike network interface names, a VCP interface name does not include a slot number (member ID). • The dedicated VCPs are **vcp-0** and **vcp-1**. • The uplink module ports set as VCPs are named **1/0** and **1/1**, representing the PIC number and the port number.

Table 115: show virtual-chassis vc-port Output Fields *(continued)*

Field Name	Field Description
Type	Type of VCP: • **Dedicated** (on the rear panel) • **Configured** (uplink module port configured as a VCP) • **Auto-Configured** (uplink module port autoconfigured as a VCP) See "Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)" on page 792 for information about configuring VCPs.
Trunk ID	A positive-number ID assigned to a LAG formed by the Virtual Chassis. The trunk ID value is **–1** if no trunk is formed. A LAG between uplink VCPs requires that the link speed be the same on connected interfaces and that at least two VCPs on one member be connected to at least two VCPs on the other member. Dedicated VCP LAGs are assigned trunk IDs 1 and 2. Trunk IDs for LAGs formed with uplink VCPs therefore have values of 3 or greater. The trunk ID value changes if the link-adjacency state between LAG members changes; trunk membership is then allocated or deallocated.
Status	Interface status: **down** or **up**.
Speed (mbps)	Speed of the interface in megabits per second.
Neighbor ID/Interface	The Virtual Chassis member ID and interface of a VCP on a member switch that is connected to the interface or PIC/Port field in the same row as this interface.

show virtual-chassis vc-port statistics

Syntax

show virtual-chassis vc-port statistics
<all-members>
<brief | detail | extensive >
<*interface-name*>
<local>
<member *member-id*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display the traffic statistics collected on Virtual Chassis ports (VCPs).

Options

none—Display traffic statistics for the VCPs of all members of a Virtual Chassis configuration.

brief | detail | extensive—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** and **extensive** options provide identical displays.

all-members—(Optional) Display traffic statistics for the VCPs of all members of a Virtual Chassis configuration.

interface-name—(Optional) Name of the VCP interface for which to display traffic statistics. Specify either **vcp-0** or **vcp-1** or an internal port in the VCP subsystem—for example, **internal-0/24**.

local—(Optional) Display VCP traffic statistics for only the switch on which this command is entered.

member *member-id*—(Optional) Display VCP traffic statistics for only the specified member of a Virtual Chassis configuration.

Output Fields

Table 116 on page 855 lists the output fields for the **show virtual-chassis vc-port statistics** command. Output fields are listed in the approximate order in which they appear.

Table 116: show virtual-chassis vc-port statistics Output Fields

Field Name	Field Description	Level of Output
fpc*number*	ID of the Virtual Chassis member. The FPC number is the same as the member ID.	All levels
Interface	VCP interface name. Unlike network interface names, a VCP interface does not include a slot number (member ID). • The dedicated VCPs are **vcp-0** and **vcp-1**. • Ports internal to the VCP subsystem have names corresponding to the PIC and port number. For example, **0/24** indicates internal onboard port 24, and 1/26 indicates internal uplink module port 26.	**brief**
Input Octets/Packets	Total number of octets and packets received on the VCP interface.	**brief member** none
Output Octets/Packets	Total number of octets and packets transmitted on the VCP interface.	**brief member** none
master: ***number***	Member ID of the Virtual Chassis master.	All levels
Port	VCP for which **RX** (Receive) statistics,**TX** (Transmit) statistics, or both are reported by the VCP subsystem during a sampling interval—since the statistics counter was last cleared.	**detail extensive**
Total octets	Total number of octets received and transmitted on the VCP interface.	**detail extensive**
Total packets	Total number of packets received and transmitted on the VCP interface.	**detail extensive**
Unicast packets	Number of unicast packets received and transmitted on the VCP interface.	**detail extensive**
Broadcast packets	Number of broadcast packets received and transmitted on the VCP interface.	**detail extensive**
Multicast packets	Number of multicast packets received and transmitted on the VCP interface.	**detail extensive**
MAC control frames	Number of media access control (MAC) control frames received and transmitted on the VCP interface.	**detail extensive**
CRC alignment errors	Number of packets received on the VCP interface that had a length—excluding framing bits, but including frame check sequence (FCS) octets—of between 64 and 1518 octets, inclusive, and had one of the following errors: • Invalid FCS with an integral number of octets (FCS error) • Invalid FCS with a nonintegral number of octets (alignment error)	**detail extensive**
Oversize packets	Number of packets received on the VCP interface that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed.	**detail extensive**
Undersize packets	Number of packets received on the VCP interface that were shorter than 64 octets (excluding framing bits but including FCS octets) and were otherwise well formed..	**detail extensive**

Table 116: show virtual-chassis vc-port statistics Output Fields *(continued)*

Field Name	Field Description	Level of Output
Jabber packets	Number of packets received on the VCP interface that were longer than 1518 octets—excluding framing bits, but including FCS octets—and that had either an FCS error or an alignment error. NOTE: This definition of *jabber* is different from the definition in IEEE-802.3 section 8.2.1.5 (10Base5) and section 10.3.1.4 (10Base2). These documents define *jabber* as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.	**detail extensive**
Fragments received	Number of packets received on the VCP interface that were shorter than 64 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.	**detail extensive**
Ifout errors	Number of outbound packets received on the VCP interface that could not be transmitted because of errors.	**detail extensive**
Packet drop events	Number of outbound packets received on the VCP interface that were dropped, rather than being encapsulated and sent out of the switch as fragments. The packet drop counter is incremented if a temporary shortage of packet memory causes packet fragmentation to fail.	**detail extensive**
64 octets frames	Number of packets received on the VCP interface (including invalid packets) that were 64 octets in length (excluding framing bits, but including FCS octets).	**detail extensive**
65–127 octets frames	Number of packets received on the VCP interface (including invalid packets) that were between 65 and 127 octets in length, inclusive (excluding framing bits, but including FCS octets).	**detail extensive**
128–255 octets frames	Number of packets received on the VCP interface (including invalid packets) that were between 128 and 255 octets in length, inclusive (excluding framing bits, but including FCS octets).	**detail extensive**
256–511 octets frames	Number of packets received on the VCP interface (including invalid packets) that were between 256 and 511 octets in length, inclusive (excluding framing bits, but including FCS octets).	**detail extensive**
512–1023 octets frames	Number of packets received on the VCP interface (including invalid packets) that were between 512 and 1023 octets in length, inclusive (excluding framing bits, but including FCS octets).	**detail extensive**
1024–1518 octets frames	Number of packets received on the VCP interface (including invalid packets) that were between 1024 and 1518 octets in length, inclusive (excluding framing bits, but including FCS octets).	**detail extensive**
Rate packets per second	Number of packets per second received and transmitted on the VCP interface.	**detail extensive**
Rate bytes per second	Number of bytes per second received and transmitted on the VCP interface.	**detail extensive**

PART 12

Interfaces on J-EX Series Switches

CHAPTER 50

Interfaces—Overview

J-EX Series Switches Interfaces Overview

J-EX Series Switches have two types of interfaces: network interfaces and special interfaces. This topic provides brief information on these interfaces. For additional information, see the *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

For information on interface-naming conventions on J-EX Series Switches, see "Understanding Interface Naming Conventions on J-EX Series Switches" on page 865.

This topic describes:

Network Interfaces

Network interfaces connect to the network and carry network traffic. Table 117 on page 863 lists the types of network interfaces supported on J-EX Series switches.

Table 117: Network Interface Types and Purposes

Type	Purpose
Aggregated Ethernet interfaces	All J-EX Series switches allow you to group Ethernet interfaces at the physical layer to form a single link layer interface, also known as a *link aggregation group (LAG)* or *bundle*. These aggregated Ethernet interfaces help to balance traffic and increase the uplink bandwidth.

Table 117: Network Interface Types and Purposes *(continued)*

Type	Purpose
LAN access interfaces	Use these J-EX Series switch interfaces to connect a personal computer, laptop, file server, or printer to the network. When you power on a J-EX Series switch and use the factory-default configuration, the software automatically configures interfaces in access mode for each of the network ports. The default configuration also enables autonegotiation for both speed and link mode.
Power over Ethernet (PoE) interfaces	J-EX Series switches provide PoE network ports with various switch models. These ports can be used to connect voice over IP (VoIP) telephones, wireless access points, video cameras, and point-of-sale devices to safely receive power from the same access ports that are used to connect personal computers to the network. PoE interfaces are enabled by default in the factory configuration.
Trunk interfaces	J-EX Series access switches can be connected to a distribution switch or customer-edge (CE) switches or routers. To use a port for this type of connection, you must explicitly configure the port interface for trunk mode. The interfaces from the distribution switch or CE switch to the access switches must also be configured for trunk mode.

Special Interfaces

Table 118 on page 864 lists the types of special interfaces supported on J-EX Series switches.

Table 118: Special Interface Types and Purposes

Type	Purpose
Console port	Each J-EX Series switch has a serial port, labeled **CON** or **CONSOLE**, for connecting tty-type terminals to the switch using standard PC-type tty cables. The console port does not have a physical address or IP address associated with it. However, it is an interface in the sense that it provides access to the switch. On J-EX4200 switches that are configured as a Virtual Chassis, you can access the master and configure all members of the Virtual Chassis through any member's console port. For more information on the console port in a Virtual Chassis, see “Understanding Global Management of a Virtual Chassis Configuration” on page 699.
Loopback	All J-EX Series switches have this software-only virtual interface that is always up. The loopback interface provides a stable and consistent interface and IP address on the switch.
Management interface	The Junos OS for J-EX Series switches automatically creates the switch's management Ethernet interface, **me0**. The management Ethernet interface provides an out-of-band method for connecting to the switch. To use **me0** as a management port, you must configure its logical port, **me0.0**, with a valid IP address. You can connect to the management interface over the network using utilities such as SSH or Telnet. SNMP can use the management interface to gather statistics from the switch. (The management interface **me0** is analogous to the **fxp0** interfaces on routers running the Junos OS.)
Routed VLAN Interface (RVI)	J-EX Series switches use a Layer 3 routed VLAN interface (RVI) named **vlan** to route traffic from one broadcast domain to another and to perform other Layer 3 functions such as traffic engineering. These functions are typically performed by a router interface in a traditional network. The RVI functions as a logical router, eliminating the need for having both a switch and a router. The RVI (the **vlan** interface) must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed out of it.

Table 118: Special Interface Types and Purposes *(continued)*

Type	Purpose
Virtual Chassis port (VCP) interfaces	Each J-EX4200 switch has two dedicated *Virtual Chassis ports (VCPs)* on its rear panel. These ports can be used to interconnect two to ten J-EX4200 switches as a *Virtual Chassis*, which functions as a single network entity. See "Understanding the High-Speed Interconnection of the Virtual Chassis Members" on page 702. When you power on J-EX Series switches that are interconnected in this manner, the software automatically configures the VCP interfaces for the dedicated ports that have been interconnected. These VCP interfaces are not configurable or modifiable. You can also interconnect J-EX4200 switches across distances of up to 25 miles (40 km) by using the SFP or SFP+ uplink module ports. To do so, you must explicitly set the uplink module ports on the members you want to connect as VCPs. See "Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)" on page 792. When you set the uplink module ports as uplink VCPs and connect member switches through those uplink VCPs, a LAG is automatically formed when the link speed is the same on connected VCPs and at least two VCPs on one member are connected to at least two VCPs on another member. See "Understanding Virtual Chassis Configurations and Link Aggregation" on page 702.
Virtual management Ethernet (VME) interface	J-EX4200 switches have a VME interface. This is a logical interface that is used for Virtual Chassis configurations and allows you to manage all the members of the Virtual Chassis through the master. For more information on the VME interface, see "Understanding Global Management of a Virtual Chassis Configuration" on page 699.

Understanding Interface Naming Conventions on J-EX Series Switches

J-EX Series Switches use a naming convention for defining the interfaces that is similar to that of other platforms running under the Junos OS. This topic provides brief information on the naming conventions used for interfaces on J-EX Series switches. For additional information, see the *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

This topic describes:

- Physical Part of an Interface Name on page 865
- Logical Part of an Interface Name on page 866
- Wildcard Characters in Interface Names on page 867

Physical Part of an Interface Name

Interfaces in Junos OS are specified as follows:

type-fpc / pic / port

J-EX Series switches apply this convention as follows:

- *type*—J-EX Series interfaces use the following media types:
  - **ge**—Gigabit Ethernet interface
  - **xe**—10 Gigabit Ethernet interface
  - **fe**—Fast Ethernet interface
- *fpc*—Flexible PIC Concentrator. J-EX Series interfaces use the following convention for the FPC number in interface names:
  - On J-EX4200 standalone switches, FPC refers to the switch itself. The FPC number is always **0** on these switches.
  - On J-EX4200 switches configured in a Virtual Chassis, the FPC number indicates the member ID of the switch within the Virtual Chassis, from **0** through **9**.
  - On J-EX8200 switches, the FPC number indicates the slot number of the line card that contains the physical interface.
- *pic*—J-EX Series interfaces use the following convention for the PIC (Physical Interface Card) number in interface names:
  - On J-EX4200 switches, the PIC number is **0** for all built-in interfaces (interfaces that are not an uplink port) and **1** for uplink ports.
  - On J-EX8200 switches, the PIC number is always **0**.
- *port*—J-EX Series interfaces use the following convention for port numbers:
  - On J-EX4200 switches, built-in network ports are numbered from left to right. On models that have two rows of ports, the ports on the top row start with **0** followed by the remaining even-numbered ports, and the ports on the bottom row start with **1** followed by the remaining odd-numbered ports.
  - Uplink ports in J-EX4200 switches are labeled from left to right, starting with **0**.
  - On J-EX8200 switches, the network ports are numbered from left to right on each line card. On line cards that have two rows of ports, the ports on the top row start with **0** followed by the remaining even-numbered ports, and the ports on the bottom row start with **1** followed by the remaining odd-numbered ports.

Logical Part of an Interface Name

The logical unit part of the interface name corresponds to the logical unit number, which can be a number from 0 through 16384. In the virtual part of the name, a period (.) separates the port and logical unit numbers: *type-fpc/pic/port.logical-unit-number*. For example, if you issue the **show ethernet-switching interfaces** command on a system with a default VLAN, the resulting display shows the logical interfaces associated with the VLAN:

```
Interface   State    VLAN members          Blocking
ge-0/0/0.0  down     remote-analyzer       unblocked
```

```
ge-0/0/1.0  down     default              unblocked
ge-0/0/10.0 down     default              unblocked
```

When you configure aggregated Ethernet interfaces, you configure a logical interface that is called a *bundle* or a *LAG*. Each LAG can include up to 8 or 12 Ethernet interfaces, depending on the switch model.

Wildcard Characters in Interface Names

In the **show interfaces** and **clear interfaces** commands, you can use wildcard characters in the ***interface-name*** option to specify groups of interface names without having to type each name individually. You must enclose all wildcard characters except the asterisk (*) in quotation marks (" ").

Understanding Aggregated Ethernet Interfaces and LACP

IEEE 802.3ad link aggregation enables you to group Ethernet interfaces to form a single link layer interface, also known as a *link aggregation group (LAG)* or *bundle*.

Aggregating multiple links between physical interfaces creates a single logical point-to-point trunk link or a LAG. The LAG balances traffic across the member links within an aggregated Ethernet bundle and effectively increases the uplink bandwidth. Another advantage of link aggregation is increased availability, because the LAG is composed of multiple member links. If one member link fails, the LAG continues to carry traffic over the remaining links.

Link Aggregation Control Protocol (LACP), a component of IEEE 802.3ad, provides additional functionality for LAGs.

This topic describes:

- Link Aggregation Group (LAG) on page 867
- Link Aggregation Control Protocol (LACP) on page 868

Link Aggregation Group (LAG)

You configure a LAG by specifying the link number as a physical device and then associating a set of interfaces (ports) with the link. All the interfaces must have the same speed and be in full-duplex mode. The Junos OS for J-EX Series Switches assigns a unique ID and port priority to each interface. The ID and priority are not configurable.

The number of interfaces that can be grouped into a LAG and the total number of LAGs supported on a switch varies according to switch model. Table 119 on page 868 lists the J-EX Series switches and the maximum number of interfaces per LAG and maximum number of LAGs they support.

Table 119: Maximum Interfaces per LAG and Maximum LAGs per Switch

Switch Model	Maximum Interfaces per LAG	Maximum LAGs
J-EX4200	8	64
J-EX8200	12	255

When configuring LAGs, consider the following guidelines:

- The LAG must be configured on both sides of the link.
- The interfaces on either side of the link must be set to the same speed.
- You can configure and apply firewall filters on a LAG.
- LACP can optionally be configured for link negotiation.

You can combine physical Ethernet ports belonging to different member switches of a Virtual Chassis configuration to form a LAG. See "Understanding Virtual Chassis Configurations and Link Aggregation" on page 702.

NOTE: The interfaces that are included within a bundle or LAG are sometimes referred to as *member interfaces*. Do not confuse this term with *member switches*, which refers to J-EX4200 Ethernet Switches that are interconnected as a Virtual Chassis. It is possible to create a LAG that is composed of member interfaces that are located in different member switches of a Virtual Chassis.

A LAG creates a single logical point-to-point connection. A typical deployment for a LAG would be to aggregate trunk links between an access switch and a distribution switch or customer edge (CE) router.

Link Aggregation Control Protocol (LACP)

When LACP is configured, it detects misconfigurations on the local end or the remote end of the link.

About enabling LACP:

- When LACP is not enabled, a local LAG might attempt to transmit packets to a remote single interface, which causes the communication to fail.
- When LACP is enabled, a local LAG cannot transmit packets unless a LAG with LACP is also configured on the remote end of the link.

By default, Ethernet links do not exchange protocol data units (PDUs), which contain information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. The transmitting link is known as the *actor* and the receiving link is known as the *partner*.

In a scenario where a dual-homed server is deployed with a switch, the network interface cards form a LAG with the switch. During a server upgrade, the server may not be able to exchange LACP PDUs. In such a situation you can configure an interface to be in the UP state even if no PDUs are exchanged. Use the **force-up** statement to configure an interface when the peer has limited LACP capability. The interface selects the associated LAG by default, whether the switch and peer are both in active or passive mode. When there are no received PDUs, the partner is considered to be working in the passive mode. Therefore, LACP PDU transmissions are controlled by the transmitting link.

If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

Understanding Interface Ranges on J-EX Series Switches

You can use the interface ranges to group interfaces of the same type that share a common configuration profile. This helps reduce the time and effort in configuring interfaces on J-EX Series switches. The configurations common to all the interfaces can be included in the interface range definition.

The interface range definition contains the name of the interface range defined, the names of the individual member interfaces that do not fall in a series of interfaces, a range of interfaces defined in the member range, and the configuration statements common to all the interfaces. An interface range defined with member ranges and individual members but without any common configurations, is also a valid definition.

NOTE: The interface range definition is supported only for Gigabit, 10-Gigabit, and Fast Ethernet interfaces.

The common configurations defined in the interface range will be overridden by the local configuration.

The defined interface ranges can be used at places where the **interface** node is used in the following configuration hierarchies:

- ethernet-switching-options analyzer *name* input egress interface
- ethernet-switching-options analyzer *name* input ingress interface
- ethernet-switching-options analyzer output interface

Understanding Layer 3 Subinterfaces

A Layer 3 subinterface is a logical division of a physical interface that operates at the network level and therefore can receive and forward 802.1Q VLAN tags. You can use Layer 3 subinterfaces to route traffic among multiple VLANs along a single trunk line that connects a J-EX Series Switch to a Layer 2 switch. Only one physical connection is required between the switches. This topology is often called a “router on a stick” or a “one-armed router” when the Layer 3 device is a router.

To create Layer 3 subinterfaces on a J-EX Series switch, you enable VLAN tagging, partition the physical interface into logical partitions, and bind the VLAN ID to the logical interface.

You can partition one physical interface into up to 4094 different subinterfaces, one for each VLAN. We recommend that you use the VLAN ID as the subinterface number when you configure the subinterface. The Junos OS reserves VLAN IDs 0 and 4095.

VLAN tagging places the VLAN ID in the frame header, allowing each physical interface to handle multiple VLANs. When you configure multiple VLANs on an interface, you must also enable tagging on that interface. Junos OS on J-EX Series switches supports a subset of the 802.1Q standard for receiving and forwarding routed or bridged Ethernet frames with single VLAN tags and running Virtual Router Redundancy Protocol (VRRP) over 802.1Q-tagged interfaces. Double-tagging is not supported.

Understanding Unicast RPF for J-EX Series Switches

Unicast reverse-path forwarding (RPF) helps protect the switch against denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by verifying the unicast source address of each packet that arrives on an ingress interface where unicast RPF is enabled. It also helps ensure that traffic arriving on ingress interfaces comes from a network source that the receiving interface can reach.

When you enable unicast RPF, the switch forwards a packet only if the receiving interface is the best return path to the packet's unicast source address. This is known as strict mode unicast RPF.

NOTE: On J-EX4200 Ethernet Switches, the switch applies unicast RPF *globally* to all interfaces when unicast RPF is configured on any interface. For additional information, see "Limitations of the Unicast RPF Implementation on J-EX4200 Switches" on page 875.

This topic covers:

Unicast RPF for J-EX Series Switches Overview

Unicast RPF functions as an ingress filter that reduces the forwarding of IP packets that might be spoofing an address. By default, unicast RPF is disabled on the switch interfaces.

The type of unicast RPF provided on the switches—that is, strict mode unicast RPF is especially useful on untrusted interfaces. An untrusted interface is an interface where untrusted users or processes can place packets on the network segment.

The switch supports only the active paths method of determining the best return path back to a unicast source address. The active paths method looks up the best reverse path entry in the forwarding table. It does not consider alternate routes specified using routing-protocol-specific methods when determining the best return path.

If the forwarding table lists the receiving interface as the interface to use to forward the packet back to its unicast source, it is the best return path interface. Strict mode unicast RPF recognizes only one best return path to a unicast source address.

Use strict mode unicast RPF only on symmetrically routed interfaces. (For information about symmetrically routed interfaces, see "When to Enable Unicast RPF" on page 873.)

For more information about strict unicast RPF, see RFC 3704, *Ingress Filtering for Multihomed Networks* at http://www.ietf.org/rfc/rfc3704.txt.

Unicast RPF Implementation for J-EX Series Switches

This section includes:

Unicast RPF Packet Filtering

When you enable unicast RPF on the switch, the switch handles traffic in the following manner:

- If the switch receives a packet on the interface that is the best return path to the unicast source address of that packet, the switch forwards the packet.
- If the best return path from the switch to the packet's unicast source address is not the receiving interface, the switch discards the packet.
- If the switch receives a packet that has a source IP address that does not have a routing entry in the forwarding table, the switch discards the packet.

Bootstrap Protocol (BOOTP) and DHCP Requests

Bootstrap protocol (BOOTP) and DHCP request packets are sent with a broadcast MAC address and therefore the switch does not perform unicast RPF checks on them. The switch forwards all BOOTP packets and DHCP request packets without performing unicast RPF checks.

Default Route Handling

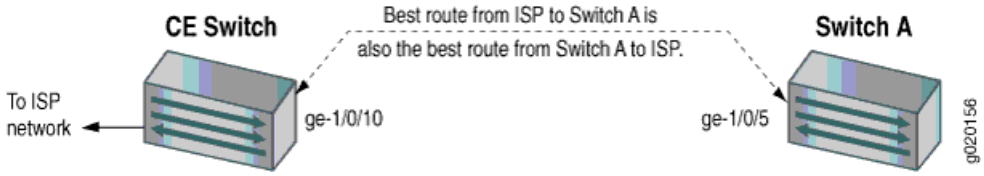
If the best return path to the source is the default route (**0.0.0.0**) and the default route points to **reject**, the switch discards all unicast RPF packets. If the default route points to a valid network interface, the switch performs a normal unicast RPF check on the packets.

When to Enable Unicast RPF

Enable unicast RPF when you want to ensure that traffic arriving on a network interface comes from a source that resides on a network that that interface can reach. You can enable unicast RPF on untrusted interfaces to filter spoofed packets. For example, a common application for unicast RPF is to help defend an enterprise network from DoS/DDoS attacks coming from the Internet.

Enable unicast RPF only on symmetrically routed interfaces. A symmetrically routed interface uses the same route in both directions between the source and the destination, as shown in Figure 22 on page 874. Symmetrical routing means that if an interface receives a packet, the switch uses the same interface to send a reply to the packet source (the receiving interface matches the forwarding-table entry for the best return path to the source).

Figure 22: Symmetrically Routed Interfaces



Enabling unicast RPF on asymmetrically routed interfaces (where different interfaces receive a packet and reply to its source) results in packets from legitimate sources being filtered (discarded) because the best return path is not the same interface that received the packet.

The following switch interfaces are most likely to be symmetrically routed and thus are candidates for unicast RPF enabling:

- The service provider edge to a customer
- The customer edge to a service provider
- A single access point out of the network (usually on the network perimeter)
- A terminal network that has only one link

NOTE: Because unicast RPF is enabled globally on J-EX4200 switches, ensure that *all* interfaces are symmetrically routed before you enable unicast RPF on those switches. Enabling unicast RPF on asymmetrically routed interfaces results in packets from legitimate sources being filtered.

TIP: Enabling unicast RPF as close as possible to the traffic source stops spoofed traffic before it can proliferate or reach interfaces that do not have unicast RPF enabled.

When Not to Enable Unicast RPF

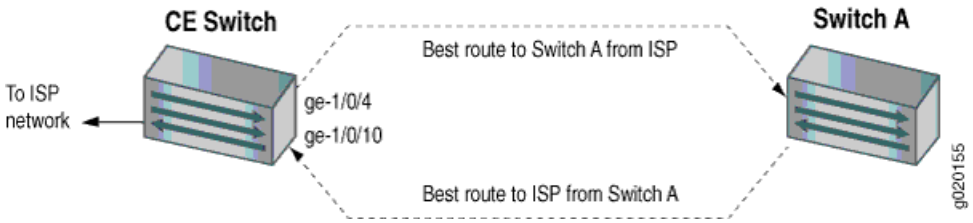
Typically, you will not enable unicast RPF if:

- Switch interfaces are multihomed.
- Switch interfaces are trusted interfaces.
- BGP is carrying prefixes and some of those prefixes are not advertised or are not accepted by the ISP under its policy. (The effect in this case is the same as filtering an interface by using an incomplete access list.)
- Switch interfaces face the network core. Core-facing interfaces are usually asymmetrically routed.

An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination, as shown in Figure 23 on page 875. This means that if an interface receives a packet, that interface does not match the forwarding table

entry as the best return path back to the source. If the receiving interface is not the best return path to the source of a packet, unicast RPF causes the switch to discard the packet even though it comes from a valid source.

Figure 23: Asymmetrically Routed Interfaces



NOTE: Do not enable unicast RPF on J-EX4200 switches if any switch interfaces are asymmetrically routed, because unicast RPF is enabled globally on all interfaces of those switches. All switch interfaces must be symmetrically routed for you to enable unicast RPF without the risk of the switch discarding traffic that you want to forward.

Limitations of the Unicast RPF Implementation on J-EX4200 Switches

On J-EX4200 switches, the switch implements unicast RPF on a global basis. You cannot enable unicast RPF on a per-interface basis. Unicast RPF is globally disabled by default.

- When you enable unicast RPF on any interface, it is automatically enabled on all switch interfaces, including link aggregation groups (LAGs) and routed VLAN interfaces (RVIs).
- When you disable unicast RPF on the interface (or interfaces) on which you enabled unicast RPF, it is automatically disabled on all switch interfaces.

NOTE: You must explicitly disable unicast RPF on every interface on which it was explicitly enabled or unicast RPF remains enabled on all switch interfaces.

The J-EX4200 switches do not perform unicast RPF filtering on equal-cost multipath (ECMP) traffic. The unicast RPF check examines only one best return path to the packet source, but ECMP traffic employs an address block consisting of multiple paths.

Using unicast RPF to filter ECMP traffic on J-EX4200 switches can result in the switch discarding packets that you want to forward because the unicast RPF filter does not examine the entire ECMP address block.

Understanding IP Directed Broadcast for J-EX Series Switches

IP directed broadcast helps you implement remote administration tasks such as backups and wake-on-LAN (WOL) application tasks by sending broadcast packets targeted at the hosts in a specified destination subnet. IP directed broadcast packets traverse the network in the same way as unicast IP packets until they reach the destination subnet. When they reach the destination subnet and IP directed broadcast is enabled on the receiving switch, the switch translates ("explodes") the IP directed broadcast packet into a broadcast that floods the packet on the target subnet. All hosts on the target subnet receive the IP directed broadcast packet.

This topic covers:

IP Directed Broadcast for J-EX Series Switches Overview

IP directed broadcast packets have a destination IP address that is a valid broadcast address for the subnet that is the target of the directed broadcast (the target subnet). The intent of an IP directed broadcast is to flood the target subnet with the broadcast packets without broadcasting to the entire network. IP directed broadcast packets cannot originate from the target subnet.

When you send an IP directed broadcast packet, as it travels to the target subnet, the network forwards it in the same way as it forwards a unicast packet. When the packet reaches a switch that is directly connected to the target subnet, the switch checks to see whether IP directed broadcast is enabled on the interface that is directly connected to the target subnet:

- If IP directed broadcast is enabled on that interface, the switch broadcasts the packet on that subnet by rewriting the destination IP address as the configured broadcast IP address for the subnet. The switch converts the packet to a link-layer broadcast packet that every host on the network processes.
- If IP directed broadcast is disabled on the interface that is directly connected to the target subnet, the switch drops the packet.

IP Directed Broadcast Implementation for J-EX Series Switches

You configure IP directed broadcast on a per-subnet basis by enabling IP directed broadcast on the Layer 3 interface of the subnet's VLAN. When the switch that is connected to that subnet receives a packet that has the subnet's broadcast IP address as the destination address, the switch broadcasts the packet to all hosts on the subnet.

By default, IP directed broadcast is disabled.

When to Enable IP Directed Broadcast

IP directed broadcast is disabled by default. Enable IP directed broadcast when you want to perform remote management or administration services such as backups or WOL tasks on hosts in a subnet that does not have a direct connection to the Internet.

Enabling IP directed broadcast on a subnet affects only the hosts within that subnet. Only packets received on the subnet's Layer 3 interface that have the subnet's broadcast IP address as the destination address are flooded on the subnet.

When Not to Enable IP Directed Broadcast

Typically, you do not enable IP directed broadcast on subnets that have direct connections to the Internet. Disabling IP directed broadcast on a subnet's Layer 3 interface affects only that subnet. If you disable IP directed broadcast on a subnet and a packet that has the broadcast IP address of that subnet arrives at the switch, the switch drops the broadcast packet.

If a subnet has a direct connection to the Internet, enabling IP directed broadcast on it increases the network's susceptibility to denial-of-service (DoS) attacks.

For example, a malicious attacker can spoof a source IP address (use a source IP address that is not the actual source of the transmission to deceive a network into identifying the attacker as a legitimate source) and send IP directed broadcasts containing Internet Control Message Protocol (ICMP) echo (ping) packets. When the hosts on the network with IP directed broadcast enabled receive the ICMP echo packets, they all send replies to the victim that has the spoofed source IP address. This creates a flood of ping replies in a DoS attack that can overwhelm the spoofed source address; this is known as a "smurf" attack. Another common DoS attack on exposed networks with IP directed broadcast enabled is a "fraggle" attack, which is similar to a smurf attack except that the malicious packet is a User Datagram Protocol (UDP) echo packet instead of an ICMP echo packet.

High Availability Features for J-EX Series Switches Overview

High availability refers to the hardware and software components that provide redundancy and reliability for packet-based communications. This topic covers the following high availability features of J-EX Series Switches:

- VRRP on page 878
- Graceful Protocol Restart on page 878
- Redundant Routing Engines on page 878
- Graceful Routing Engine Switchover on page 879
- Virtual Chassis Software Upgrade and Failover Features on page 879
- Link Aggregation on page 880

VRRP

You can configure the Virtual Router Redundancy Protocol (VRRP) or VRRP for IPv6 on Gigabit Ethernet interfaces, 10-Gigabit Ethernet interfaces, and logical interfaces on J-EX Series switches. When VRRP is configured, the switches act as virtual routing platforms. VRRP enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. The VRRP routing platforms share the IP address corresponding to the default route configured on the hosts. At any time, one of the VRRP routing platforms is the master (active) and the others are backups. If the master routing platform fails, one of the backup routing platforms becomes the new master, providing a virtual default routing platform and enabling traffic on the LAN to be routed without relying on a single routing platform. Using VRRP, a backup J-EX Series switch can take over a failed default switch within a few seconds. This is done with minimum loss of VRRP traffic and without any interaction with the hosts.

For more information on VRRP, see “Understanding VRRP on J-EX Series Switches” on page 1425.

Graceful Protocol Restart

With standard implementations of routing protocols, any service interruption requires an affected switch to recalculate adjacencies with neighboring switches, restore routing table entries, and update other protocol-specific information. An unprotected restart of a switch can result in forwarding delays, route flapping, wait times stemming from protocol reconvergence, and even dropped packets. Graceful protocol restart allows a restarting switch and its neighbors to continue forwarding packets without disrupting network performance. Because neighboring switches assist in the restart (these neighbors are called helper switches), the restarting switch can quickly resume full operation without recalculating algorithms from scratch.

On J-EX Series switches, graceful protocol restart can be applied to aggregate and static routes and for routing protocols (BGP, IS-IS, OSPF, and RIP).

Graceful protocol restart works similarly for the different routing protocols. The main benefits of graceful protocol restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful protocol restart thus allows a switch to pass through intermediate convergence states that are hidden from the rest of the network. Most graceful restart implementations define two types of switches—the restarting switch and the helper switch. The restarting switch requires rapid restoration of forwarding state information so that it can resume the forwarding of network traffic. The helper switch assists the restarting switch in this process. Individual graceful restart configuration statements typically apply to either the restarting switch or the helper switch.

Redundant Routing Engines

Two to ten J-EX4200 switches can be interconnected to create a Virtual Chassis configuration that operates as a single network entity. Every Virtual Chassis configuration has a master and a backup. The master acts as the master Routing Engine and the backup

acts as the backup Routing Engine. The Routing Engine provides the following functionality:

- Runs various routing protocols
- Provides the forwarding table to the Packet Forwarding Engines (PFEs) in all the member switches of the Virtual Chassis configuration
- Runs other management and control processes for the entire Virtual Chassis configuration

The master Routing Engine, which is in the master of the Virtual Chassis configuration, runs the Junos OS in the master role. It receives and transmits routing information, builds and maintains routing tables, communicates with interfaces and Packet Forwarding Engine components of the member switches, and has full control over the Virtual Chassis configuration.

The backup Routing Engine, which is in the backup of the Virtual Chassis configuration, runs the Junos OS in the backup role. It stays in sync with the master Routing Engine in terms of protocol states, forwarding tables, and so forth. If the master becomes unavailable, the backup Routing Engine takes over the functions that the master Routing Engine performs.

Graceful Routing Engine Switchover

You can configure graceful Routing Engine switchover (GRES) in a Virtual Chassis configuration, allowing the configuration to switch from the master Routing Engine in the master to the backup Routing Engine in the backup with minimal interruption to network communications. When you configure GRES, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and forwarding state. Any updates to the master Routing Engine are replicated to the backup Routing Engine as soon as they occur. If the kernel on the master Routing Engine stops operating, the master Routing Engine experiences a hardware failure, or the administrator initiates a manual switchover, mastership switches to the backup Routing Engine.

When the backup Routing Engine assumes mastership in a redundant failover configuration (that is, when graceful Routing Engine switchover is not enabled), the Packet Forwarding Engines initialize their state to boot up state before they connect to the new master Routing Engine. In contrast, in a graceful switchover configuration, the Packet Forwarding Engines do not reinitialize their state, but resynchronize their state with the new master Routing Engine. The interruption to the traffic is minimal.

Virtual Chassis Software Upgrade and Failover Features

J-EX4200 switches provide these features for increased resiliency in Virtual Chassis configurations:

- Virtual Chassis atomic software upgrade—When you upgrade software in a Virtual Chassis configuration, the upgrade will either succeed or fail on all member switches, preventing the situation in which only some of the Virtual Chassis member switches are upgraded.

- Virtual Chassis fast failover—A hardware-assisted failover mechanism that automatically reroutes traffic and reduces traffic loss in the event of a link failure.
- Virtual Chassis split and merge—If there is a disruption to the Virtual Chassis configuration due to member switches failing or being removed from the configuration, the Virtual Chassis configuration splits into two separate Virtual Chassis.

Link Aggregation

You can combine multiple physical Ethernet ports to form a logical point-to-point link, known as a *link aggregation group (LAG)* or *bundle*. A LAG provides more bandwidth than a single Ethernet link can provide. Additionally, link aggregation provides network redundancy by load-balancing traffic across all available links. If one of the links should fail, the system automatically load-balances traffic across all remaining links.

You can select up to eight Ethernet interfaces and include them within a LAG. In a J-EX4200 Virtual Chassis configuration, the interfaces that form a LAG can be on different members of the Virtual Chassis. See “Understanding Virtual Chassis Configurations and Link Aggregation” on page 702.

CHAPTER 51

Examples: Interfaces Configuration

Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch

J-EX Series switches allow you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your J-EX Series switch model. See “Understanding Aggregated Ethernet Interfaces and LACP” on page 867 for more information.

This example describes how to configure uplink LAGs to connect a Virtual Chassis access switch to a Virtual Chassis distribution switch:

Requirements

This example uses the following software and hardware components:

- Two J-EX4200-48T switches
- Two J-EX4200-24F switches
- Four uplink modules

Before you configure the LAGs, be sure you have:

- Configured the Virtual Chassis switches. See “Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet” on page 717.
- Configured the uplink ports on the switches as trunk ports. See “Configuring Gigabit Ethernet Interfaces (CLI Procedure)” on page 919.

Overview and Topology

For maximum speed and resiliency, you can combine uplinks between an access switch and a distribution switch into LAGs. Using LAGs can be particularly effective when connecting a multimember Virtual Chassis access switch to a multimember Virtual Chassis distribution switch.

The Virtual Chassis access switch in this example is composed of two member switches. Each member switch has an uplink module with two 10-Gigabit Ethernet ports. These ports are configured as trunk ports, connecting the access switch with the distribution switch.

Configuring the uplinks as LAGs has the following advantages:

- Link Aggregation Control Protocol (LACP) can optionally be configured for link negotiation.
- It doubles the speed of each uplink from 10 Gbps to 20 Gbps.
- If one physical port is lost for any reason (a cable is unplugged or a switch port fails, or one member switch is unavailable), the logical port transparently continues to function over the remaining physical port.

The topology used in this example consists of one Virtual Chassis access switch and one Virtual Chassis distribution switch. The access switch is composed of two J-EX4200-48T switches (SWA-0 and SWA-1), interconnected to each other with their Virtual Chassis ports (VCPs) as member switches of Host-A. The distribution switch is composed of two J-EX4200-24F switches (SWD-0 and SWD-1), interconnected with their VCPs as member switches of Host-D.

Each member of the access switch has an uplink module installed. Each uplink module has two ports. The uplinks are configured to act as trunk ports, connecting the access switch with the distribution switch. One uplink port from SWA-0 and one uplink port from SWA-1 are combined as LAG **ae0** to SWD-0. This link is used for one VLAN. The remaining uplink ports from SWA-0 and from SWA-1 are combined as a second LAG connection (**ae1**) to SWD-1. LAG **ae1** is used for another VLAN.

NOTE: If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

Figure 24: Topology for LAGs Connecting a Virtual Chassis Access Switch to a Virtual Chassis Distribution Switch

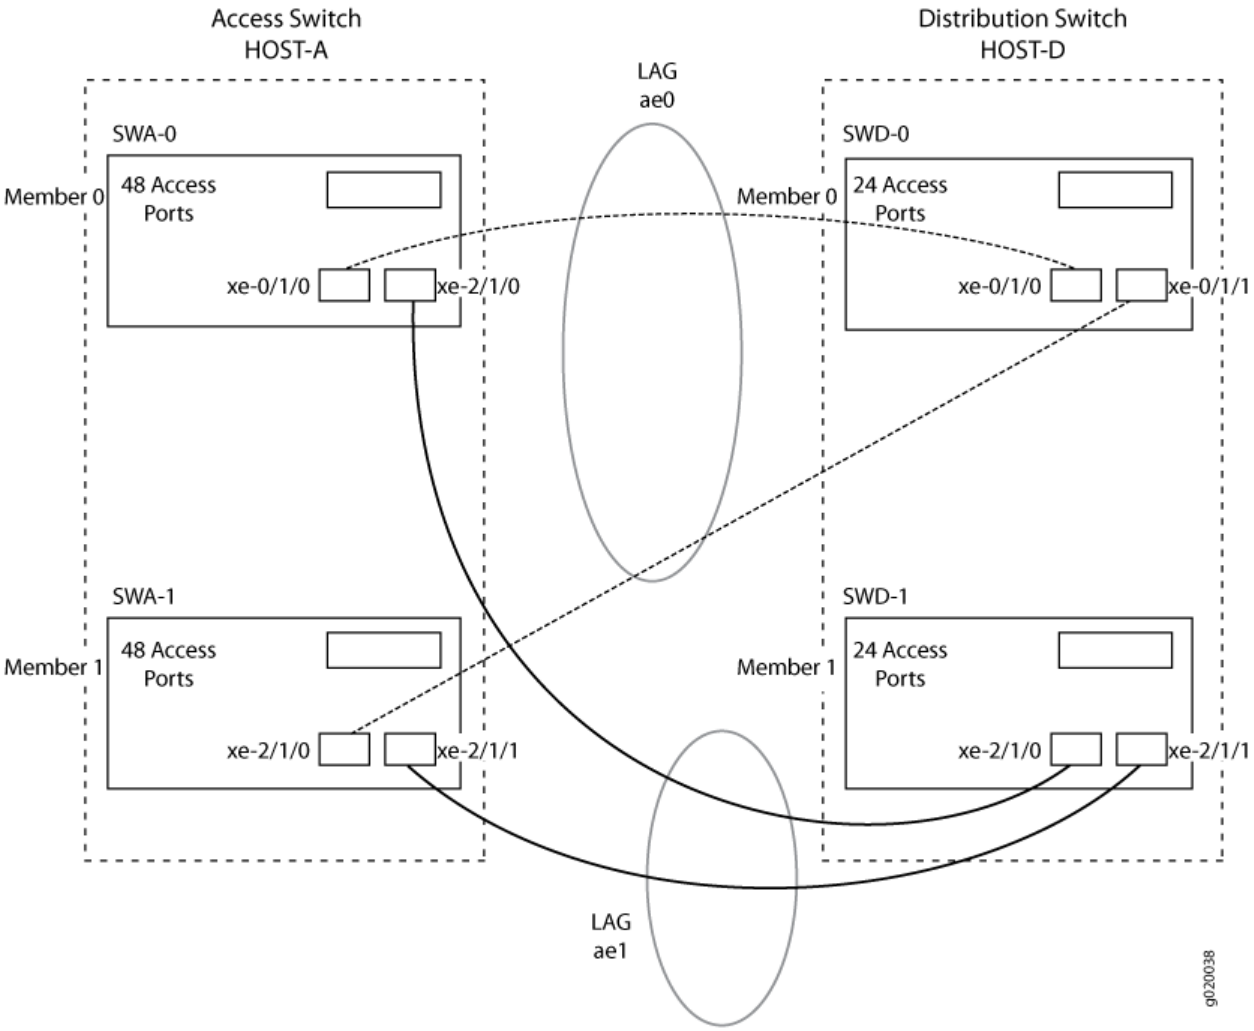

Table 120 on page 883 details the topology used in this configuration example.

Table 120: Components of the Topology for Connecting Virtual Chassis Access Switches to a Virtual Chassis Distribution Switch

Switch	Hostname and VCID	Base Hardware	Uplink Module	Member ID	Trunk Port
SWA-0	Host-A Access switch VCID 1	J-EX4200-48T switch	One uplink module	0	**xe-0/1/0** to SWD-0 **xe-0/1/1** to SWD-1
SWA-1	Host-A Access switch VCID 1	J-EX4200-48P switch	One uplink module	1	**xe-2/1/0** to SWD-0 **xe-2/1/1** to SWD-1

Table 120: Components of the Topology for Connecting Virtual Chassis Access Switches to a Virtual Chassis Distribution Switch *(continued)*

Switch	Hostname and VCID	Base Hardware	Uplink Module	Member ID	Trunk Port
SWD-0	Host-D Distribution switch VCID 4	J-EX4200 L-24F switch	One uplink module	0	**xe-0/1/0** to SWA-0 **xe-0/1/1** to SWA-1
SWD-1	Host-D Distribution switch VCID 4	J-EX4200 L-24F switch	One uplink module	1	**xe-2/1/0** to SWA-0 **xe-2/1/1** to SWA-1

Configuration

To configure two uplink LAGs from the Virtual Chassis access switch to the Virtual Chassis distribution switch:

CLI Quick Configuration

To quickly configure aggregated Ethernet high-speed uplinks between a Virtual Chassis access switch and a Virtual Chassis distribution switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set chassis aggregated-devices ethernet device-count 2
set interfaces ae0 aggregated-ether-options minimum-links 2
set interfaces ae0 aggregated-ether-options link-speed 10g
set interfaces ae1 aggregated-ether-options minimum-links 2
set interfaces ae1 aggregated-ether-options link-speed 10g
set interfaces ae0 unit 0 family inet address 192.0.2.0/25
set interfaces ae1 unit 1 family inet address 192.0.2.128/25
set interfaces xe-0/1/0 ether-options 802.ad ae0
set interfaces xe-2/1/0 ether-options 802.ad ae0
set interfaces xe-0/1/1 ether-options 802.ad ae1
set interfaces xe-2/1/1 ether-options 802.ad ae1
```

Step-by-Step Procedure

To configure aggregated Ethernet high-speed uplinks between a Virtual Chassis access switch and a Virtual Chassis distribution switch:

1. Specify the number of LAGs to be created on the chassis:

   ```
   [edit chassis]
   user@Host-A# set aggregated-devices ethernet device-count 2
   ```

2. Specify the number of links that need to be present for the **ae0** LAG interface to be **up**:

   ```
   [edit interfaces]
   user@Host-A# set ae0 aggregated-ether-options minimum-links 2
   ```

3. Specify the number of links that need to be present for the **ae1** LAG interface to be **up**:

   ```
   [edit interfaces]
   user@Host-A# set ae1 aggregated-ether-options minimum-links 2
   ```

4. Specify the media speed of the **ae0** link:

```
[edit interfaces]
user@Host-A# set ae0 aggregated-ether-options link-speed 10g
```

5. Specify the media speed of the **ae1** link:

```
[edit interfaces]
user@Host-A# set ae1 aggregated-ether-options link-speed 10g
```

6. Specify the interface ID of the uplinks to be included in LAG **ae0**:

```
[edit interfaces]
user@Host-A# set xe-0/1/0 ether-options 802.ad ae0
user@Host-A# set xe-2/1/0 ether-options 802.ad ae0
```

7. Specify the interface ID of the uplinks to be included in LAG **ae1**:

```
[edit interfaces]
user@Host-A# set xe-0/1/1 ether-options 802.ad ae1
user@Host-A# set xe-2/1/1 ether-options 802.ad ae1
```

8. Specify that LAG **ae0** belongs to the subnet for the employee broadcast domain:

```
[edit interfaces]
user@Host-A# set ae0 unit 0 family inet address 192.0.2.0/25
```

9. Specify that LAG **ae1** belongs to the subnet for the guest broadcast domain:

```
[edit interfaces]
user@Host-A# set ae1 unit 1 family inet address 192.0.2.128/25
```

Results Display the results of the configuration:

```
[edit]
chassis {
    aggregated-devices {
        ethernet {
            device-count 2;
        }
    }
}
interfaces {
    ae0 {
        aggregated-ether-options {
            link-speed 10g;
            minimum-links 2;
        }
        unit 0 {
            family inet {
                address 192.0.2.0/25;
            }
        }
    }
    ae1 {
        aggregated-ether-options {
            link-speed 10g;
            minimum-links 2;
        }
        unit 0 {
            family inet {
```

```
            address 192.0.2.128/25;
          }
        }
      xe–0/1/0 {
        ether-options {
          802.ad ae0;
        }
      }
      xe–2/1/0 {
        ether-options {
          802.ad ae0;
        }
      }
      xe–0/1/1 {
        ether-options {
          802.ad ae1;
        }
      }
      xe–12/1/1 {
        ether-options {
          802.ad ae1;
        }
      }
    }
```

Verification

To verify that switching is operational and two LAGs have been created, perform these tasks:

- Verifying That LAG ae0 Has Been Created on page 886
- Verifying That LAG ae1 Has Been Created on page 886

Verifying That LAG ae0 Has Been Created

Purpose Verify that LAG **ae0** has been created on the switch.

Action **show interfaces ae0 terse**

```
Interface               Admin      Link Proto      Local              Remote

ae0                      up        up
ae0.0                    up        up     inet     10.10.10.2/24
```

Meaning The output confirms that the **ae0** link is up and shows the **family** and IP address assigned to this link.

Verifying That LAG ae1 Has Been Created

Purpose Verify that LAG **ae1** has been created on the switch

Action **show interfaces ae1 terse**

```
Interface               Admin Link Proto    Local                 Remote
ae1                     up    down
ae1.0                   up    down inet
```

Meaning The output shows that the **ae1** link is down.

Troubleshooting

Troubleshooting a LAG That Is Down

Problem The **show interfaces terse** command shows that the LAG is **down:**

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch (or the same Virtual Chassis).

Example: Configuring Aggregated Ethernet High-Speed Uplinks with LACP Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch

J-EX Series switches allow you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your J-EX Series switch model. See “Understanding Aggregated Ethernet Interfaces and LACP” on page 867 for more information. J-EX Series switches allow you to further enhance these links by configuring Link Aggregation Control Protocol (LACP).

This example describes how to overlay LACP on the LAG configurations that were created in "Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch" on page 740:

Requirements

This example uses the following software and hardware components:

- Two J-EX4200-48T switches
- Two J-EX4200-24F switches
- Four J-EX Series uplink modules

Before you configure LACP, be sure you have:

- Set up the Virtual Chassis switches. See "Example: Configuring a Virtual Chassis with a Master and Backup in a Single Wiring Closet" on page 717.
- Configured the uplink ports on the switches as trunk ports. See "Configuring Gigabit Ethernet Interfaces (CLI Procedure)" on page 919.
- Configured the LAGs. See "Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch" on page 740

Overview and Topology

This example assumes that you are already familiar with the Example: Configuring Aggregated Ethernet High-Speed Uplinks between Virtual Chassis Access Switch and Virtual Chassis Distribution Switch. The topology in this example is exactly the same as the topology in that other example. This example shows how to use LACP to enhance the LAG functionality.

LACP exchanges are made between *actors* (the transmitting link) and *partners* (the receiving link). The LACP *mode* can be either active or passive.

NOTE: If the actor and partner are both in passive mode, they do not exchange LACP packets, which results in the aggregated Ethernet links not coming up. By default, LACP is in passive mode. To initiate transmission of LACP packets and responses to LACP packets, you must enable LACP in active mode.

By default, the actor and partner send LACP packets every second. You can configure the interval at which the interfaces send LACP packets by including the periodic statement at the **[edit interfaces *interface-name* aggregated-ether-options lacp]** hierarchy level.

The interval can be fast (every second) or slow (every 30 seconds).

Configuring LACP for the LAGs on the Virtual Chassis Access Switch

To configure LACP for the access switch LAGs, perform these tasks:

CLI Quick Configuration

To quickly configure LACP for the access switch LAGs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ae0 aggregated-ether-options lacp active periodic fast
set interfaces ae1 aggregated-ether-options lacp active periodic fast
```

Step-by-Step Procedure

To configure LACP for Host-A LAGs **ae0** and **ae1**:

1. Specify the aggregated Ethernet options for both bundles:

```
[edit interfaces]
user@Host-A#set ae0 aggregated-ether-options lacp active periodic fast
user@Host-A#set ae1 aggregated-ether-options lacp active periodic fast
```

Results

Display the results of the configuration:

```
[edit interfaces]
user@Host-A# show
ae0 {
  aggregated-ether-options {
    lacp {
      active;
      periodic fast;
    }
  }
}
ae1 {
  aggregated-ether-options {
    lacp {
      active;
      periodic fast;
    }
  }
}
```

Configuring LACP for the LAGs on the Virtual Chassis Distribution Switch

To configure LACP for the two uplink LAGs from the Virtual Chassis access switch to the Virtual Chassis distribution switch, perform these tasks:

CLI Quick Configuration

To quickly configure LACP for the distribution switch LAGs, copy the following commands and paste them into the switch terminal window:

```
[edit interfaces]
set ae0 aggregated-ether-options lacp passive periodic fast
set ae1 aggregated-ether-options lacp passive periodic fast
```

Step-by-Step Procedure

To configure LACP for Host D LAGs **ae0** and **ae1**:

1. Specify the aggregated Ethernet options for both bundles:

```
[edit interfaces]
user@Host-D#set ae0 aggregated-ether-options lacp passive periodic fast
user@Host-D#set ae1 aggregated-ether-options lacp passive periodic fast
```

Results

Display the results of the configuration:

```
[edit interfaces]
user@Host-D# show
ae0 {
  aggregated-ether-options {
    lacp {
      passive;
      periodic fast;
    }
  }
}
ae1 {
  aggregated-ether-options {
    lacp {
      passive
      periodic fast;
    }
  }
}
```

Verification

To verify that LACP packets are being exchanged, perform these tasks:

- Verifying the LACP Settings on page 890
- Verifying That the LACP Packets Are Being Exchanged on page 891

Verifying the LACP Settings

Purpose

Verify that LACP has been set up correctly.

Action

Use the **show lacp interfaces *interface-name*** command to check that LACP has been enabled as active on one end.

```
user@Host-A> show lacp interfaces xe-0/1/0

Aggregated interface: ae0

    LACP state:       Role   Exp   Def  Dist  Col  Syn  Aggr  Timeout  Activity

      xe-0/1/0      Actor    No   Yes    No   No   No   Yes     Fast    Active

      xe-0/1/0    Partner    No   Yes    No   No   No   Yes     Fast   Passive

    LACP protocol:   Receive State    Transmit State          Mux State

      xe-0/1/0          Defaulted     Fast periodic           Detached
```

Meaning The output indicates that LACP has been set up correctly and is active at one end.

Verifying That the LACP Packets Are Being Exchanged

Purpose Verify that LACP packets are being exchanged.

Action Use the **show interfaces ae*x* statistics** command to display LACP information.

```
user@Host-A> show interfaces ae0 statistics

Physical interface: ae0, Enabled, Physical link is Down
  Interface index: 153, SNMP ifIndex: 30
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1,
  Minimum bandwidth needed: 0
  Device flags   : Present Running
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  Current address: 02:19:e2:50:45:e0, Hardware address: 02:19:e2:50:45:e0
  Last flapped   : Never
  Statistics last cleared: Never
    Input packets : 0
    Output packets: 0
  Input errors: 0, Output errors: 0

  Logical interface ae0.0 (Index 71) (SNMP ifIndex 34)
    Flags: Hardware-Down Device-Down SNMP-Traps Encapsulation: ENET2
    Statistics        Packets        pps         Bytes          bps
    Bundle:
        Input :             0          0             0            0
        Output:             0          0             0            0
    Protocol inet
      Flags: None
      Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
        Destination: 10.10.10/24, Local: 10.10.10.1, Broadcast: 10.10.10.255
```

Meaning The output here shows that the link is down and that no PDUs are being exchanged.

Troubleshooting

These are some tips for troubleshooting:

Troubleshooting a Nonworking LACP Link

Problem The LACP link is not working.

Solution Check the following:

- Remove the LACP configuration and verify whether the static LAG is up.
- Verify that LACP is configured at both ends.

- Verify that LACP is not passive at both ends.
- Verify whether LACP protocol data units (PDUs) are being exchanged by running the **monitor traffic-interface *lag-member* detail** command.

Related Documentation

- Example: Connecting an Access Switch to a Distribution Switch on page 1078
- Virtual Chassis Cabling Configuration Examples for J-EX4200 Switches
- Installing an Uplink Module in a J-EX4200 Switch

Example: Configuring Layer 3 Subinterfaces for a Distribution Switch and an Access Switch

In a large LAN, you commonly need to partition the network into multiple VLANs. You can configure Layer 3 subinterfaces to route traffic between the VLANs. In one common topology, known as a "router on a stick" or a "one-armed router," you connect a router to an access switch with connections to multiple VLANs.

This example describes how to create Layer 3 subinterfaces on trunk interfaces of a distribution switch and access switch so that you can route traffic among multiple VLANs:

Requirements

This example uses the following hardware and software components:

- For the distribution switch, one J-EX4200-24F switch. This model is designed to be used as a distribution switch for aggregation or collapsed core network topologies and in space-constrained data centers. It has twenty-four 1-Gigabit Ethernet fiber SFP ports and an uplink module with two 10-Gigabit Ethernet ports.
- For the access switch, any Layer 2 switch that supports 802.1Q VLAN tags.

Before you connect the switches, make sure you have:

- Connected the two switches.
- Configured the necessary VLANs. See "Configuring VLANs for J-EX Series Switches (CLI Procedure)" on page 1136 or "Configuring VLANs for J-EX Series Switches (J-Web Procedure)" on page 1133.

Overview and Topology

In a large office with multiple buildings and VLANs, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect a single Layer 2 access switch connected to multiple VLANs to a distribution switch, enabling traffic to pass between those VLANs.

In the example topology, the LAN is segmented into five VLANs, all associated with interfaces on the access switch. One 1-Gigabit Ethernet port on the access switch's uplink module connects to one 1-Gigabit Ethernet port on the distribution switch.

Table 121 on page 894 lists the settings for the example topology.

Table 121: Components of the Topology for Creating Layer 3 Subinterfaces on an Access Switch and a Distribution Switch

Property	Settings
Access switch hardware	Any Layer 2 switch with multiple 1-Gigabit Ethernet ports and at least one 1-Gigabit Ethernet uplink module
Distribution switch hardware	J-EX4200-24F, 24 1-Gigabit Ethernet fiber SPF ports (ge-0/0/0 through ge-0/0/23); one uplink module with 10-Gigabit Ethernet ports
VLAN names and tag IDs	vlan1, tag 101 vlan2, tag 102 vlan3, tag 103 vlan4, tag 104 vlan5, tag 105
VLAN subnets	vlan1: 1.1.1.0/24 (addresses 1.1.1.1 through 1.1.1.254) vlan2: 2.1.1.0/24 (addresses 2.1.1.1 through 2.1.1.254) vlan3: 3.1.1.0/24 (addresses 3.1.1.1 through 3.1.1.254) vlan4: 4.1.1.0/24 (addresses 4.1.1.1 through 4.1.1.254) vlan5: 5.1.1.0/24 (addresses 5.1.1.1 through 5.1.1.254)
Port interfaces	On the access switch: ge-0/1/0 On the distribution switch: ge-0/0/0

Configuring the Access Switch Subinterfaces

CLI Quick Configuration

To quickly create and configure subinterfaces on the access switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/1/0 vlan-tagging
set interfaces ge-0/1/0 unit 0 vlan-id 101 family inet address 1.1.1.1/24
set interfaces ge-0/1/0 unit 1 vlan-id 102 family inet address 2.1.1.1/24
set interfaces ge-0/1/0 unit 2 vlan-id 103 family inet address 3.1.1.1/24
set interfaces ge-0/1/0 unit 3 vlan-id 104 family inet address 4.1.1.1/24
set interfaces ge-0/1/0 unit 4 vlan-id 105 family inet address 5.1.1.1/24
```

Step-by-Step Procedure

To configure the subinterfaces on the access switch:

1. On the trunk interface of the access switch, enable VLAN tagging:

```
[edit interfaces ge-0/1/0]
user@access-switch# set vlan-tagging
```

2. Bind vlan1's VLAN ID to the logical interface:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 0 vlan-id 101
```

3. Set vlan1's subinterface IP address:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 0 family inet address 1.1.1.1/24
```

4. Bind vlan2's VLAN ID to the logical interface:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 1 vlan-id 102
```

5. Set vlan2's subinterface IP address:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 1 family inet address 2.1.1.1/24
```

6. Bind vlan3's VLAN ID to the logical interface:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 2 vlan–id 103
```

7. Set vlan3's subinterface IP address:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 2 family inet address 3.1.1.1/24
```

8. Bind vlan4's VLAN ID to the logical interface:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 3 vlan-id 104
```

9. Set vlan4's subinterface IP address:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 3 family inet address 4.1.1.1/24
```

10. Bind vlan5's VLAN ID to the logical interface:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 4 vlan-id 105
```

11. Set vlan5's subinterface IP address:

```
[edit interfaces ge-0/1/0]
user@access-switch# set unit 4 family inet address 5.1.1.1/24
```

Results Check the results of the configuration:

```
user@access-switch> show configuration
interfaces {
    ge-0/1/0 {
        vlan-tagging;
        unit 0 {
            vlan-id 101;
            family inet {
                address 1.1.1.1/24;
            }
        }
        unit 1 {
            vlan-id 102;
            family inet {
                address 2.1.1.1/24;
```

```
    }
  }
  unit 2 {
    vlan-id 103;
    family inet {
      address 3.1.1.1/24;
    }
  }
  unit 3 {
    vlan-id 104;
    family inet {
      address 4.1.1.1/24;
    }
  }
  unit 4 {
    vlan-id 105;
    family inet {
      address 5.1.1.1/24;
    }
  }
}
```

Configuring the Distribution Switch Subinterfaces

CLI Quick Configuration

To quickly create and configure subinterfaces on the distribution switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 vlan-tagging
set interfaces ge-0/0/0 unit 0 vlan-id 101 family inet address 1.1.1.2/24
set interfaces ge-0/0/0 unit 1 vlan-id 102 family inet address 2.1.1.2/24
set interfaces ge-0/0/0 unit 2 vlan-id 103 family inet address 3.1.1.2/24
set interfaces ge-0/0/0 unit 3 vlan-id 104 family inet address 4.1.1.2/24
set interfaces ge-0/0/0 unit 4 vlan-id 105 family inet address 5.1.1.2/24
```

Step-by-Step Procedure

To configure subinterfaces on the distribution switch:

1. On the trunk interface of the distribution switch, enable VLAN tagging:

   ```
   [edit interfaces ge-0/0/0]
   user@distribution-switch# set vlan-tagging
   ```

2. Bind vlan1's VLAN ID to the logical interface:

   ```
   [edit interfaces ge-0/0/0]
   user@distribution-switch# set unit 0 vlan-id 101
   ```

3. Set vlan1's subinterface IP address:

   ```
   [edit interfaces ge-0/0/0]
   user@distribution-switch# set unit 0 family inet address 1.1.1.2/24
   ```

4. Bind vlan2's VLAN ID to the logical interface:

   ```
   [edit interfaces ge-0/0/0]
   user@distribution-switch# set unit 1 vlan-id 102
   ```

5. Set vlan2's subinterface IP address:

   ```
   [edit interfaces ge-0/0/0]
   ```

```
user@distribution-switch# set unit 1 family inet address 2.1.1.2/24
```

6. Bind vlan3's VLAN ID to the logical interface:

```
[edit interfaces ge-0/0/0]
user@distribution-switch# set unit 2 vlan-id 103
```

7. Set vlan3's subinterface IP address:

```
[edit interfaces ge-0/0/0]
user@distribution-switch# set unit 2 family inet address 3.1.1.2/24
```

8. Bind vlan4's VLAN ID to the logical interface:

```
[edit interfaces ge-0/0/0]
user@distribution-switch# set unit 3 vlan-id 104
```

9. Set vlan4's subinterface IP address:

```
[edit interfaces ge-0/0/0]
user@distribution-switch# set unit 3 family inet address 4.1.1.2/24
```

10. Bind vlan5's VLAN ID to the logical interface:

```
[edit interfaces ge-0/0/0]
user@distribution-switch# set unit 4 vlan-id 105
```

11. Set vlan5's subinterface IP address:

```
[edit interfaces ge-0/0/0]
user@distribution-switch# set unit 4 family inet address 5.1.1.2/24
```

Results

```
user@distribution-switch> show configuration
interfaces {
  ge-0/0/0 {
    vlan-tagging;
    unit 0 {
      vlan-id 101;
      family inet {
        address 1.1.1.2/24;
      }
    }
    unit 1 {
      vlan-id 102;
      family inet {
        address 2.1.1.2/24;
      }
    }
    unit 2 {
      vlan-id 103;
      family inet {
        address 3.1.1.2/24;
      }
    }
    unit 3 {
      vlan-id 104;
      family inet {
        address 4.1.1.2/24;
      }
    }
```

```
    unit 4 {
      vlan-id 105;
      family inet {
        address 5.1.1.2/24;
      }
    }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That Subinterfaces Were Created on page 898
- Verifying That Traffic Passes Between VLANs on page 898

Verifying That Subinterfaces Were Created

Purpose Verify that the subinterfaces were properly created on the access switch and distribution switch.

Action

1. Use the **show interfaces** command on the access switch:

```
user@access-switch> show interfaces ge-0/1/0 terse

Interface               Admin Link Proto    Local                 Remote
ge-0/1/0                up    up
ge-0/1/0.0              up    up   inet     1.1.1.1/24
ge-0/1/0.1              up    up   inet     2.1.1.1/24
ge-0/1/0.2              up    up   inet     3.1.1.1/24
ge-0/1/0.3              up    up   inet     4.1.1.1/24
ge-0/1/0.4              up    up   inet     5.1.1.1/24
ge-0/1/0.32767          up    up
```

2. Use the show interfaces command on the distribution switch:

```
user@distribution-switch> show interfaces ge-0/0/0 terse

Interface               Admin Link Proto    Local                 Remote
ge-0/0/0                up    up
ge-0/0/0.0              up    up   inet     1.1.1.2/24
ge-0/0/0.1              up    up   inet     2.1.1.2/24
ge-0/0/0.2              up    up   inet     3.1.1.2/24
ge-0/0/0.3              up    up   inet     4.1.1.2/24
ge-0/0/0.4              up    up   inet     5.1.1.2/24
ge-0/0/0.32767          up    up
```

Meaning Each subinterface created is displayed as a **ge-*fpc/pic/port.x*** logical interface, where **x** is the unit number in the configuration. The status is listed as **up**, indicating the link is working.

Verifying That Traffic Passes Between VLANs

Purpose Verify that the distribution switch is correctly routing traffic from one VLAN to another.

Action Ping from the access switch to the distribution switch on each subinterface.

1. From the access switch, ping the address of the vlan1 subinterface on the distribution switch:

```
user@access-switch> ping 1.1.1.2 count 4

PING 1.1.1.2 (1.1.1.2): 56 data bytes
64 bytes from 1.1.1.2: icmp_seq=0 ttl=64 time=0.333 ms
64 bytes from 1.1.1.2: icmp_seq=1 ttl=64 time=0.113 ms
64 bytes from 1.1.1.2: icmp_seq=2 ttl=64 time=0.112 ms
64 bytes from 1.1.1.2: icmp_seq=3 ttl=64 time=0.158 ms

--- 1.1.1.2 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.112/0.179/0.333/0.091 ms
```

2. From the access switch, ping the address of the vlan2 subinterface on the distribution switch:

```
user@access-switch> ping 2.1.1.2 count 4

PING 2.1.1.2 (2.1.1.2): 56 data bytes
64 bytes from 2.1.1.2: icmp_seq=0 ttl=64 time=0.241 ms
64 bytes from 2.1.1.2: icmp_seq=1 ttl=64 time=0.113 ms
64 bytes from 2.1.1.2: icmp_seq=2 ttl=64 time=0.162 ms
64 bytes from 2.1.1.2: icmp_seq=3 ttl=64 time=0.167 ms

--- 2.1.1.2 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.113/0.171/0.241/0.046 ms
```

3. From the access switch, ping the address of the vlan3 subinterface on the distribution switch:

```
user@access-switch> ping 3.1.1.2 count 4

PING 3.1.1.2 (3.1.1.2): 56 data bytes
64 bytes from 3.1.1.2: icmp_seq=0 ttl=64 time=0.341 ms
64 bytes from 3.1.1.2: icmp_seq=1 ttl=64 time=0.162 ms
64 bytes from 3.1.1.2: icmp_seq=2 ttl=64 time=0.112 ms
64 bytes from 3.1.1.2: icmp_seq=3 ttl=64 time=0.208 ms

--- 3.1.1.2 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.112/0.206/0.341/0.085 ms
```

4. From the access switch, ping the address of the vlan4 subinterface on the distribution switch:

```
user@access-switch> ping 4.1.1.2 count 4

PING 4.1.1.2 (4.1.1.2): 56 data bytes
64 bytes from 4.1.1.2: icmp_seq=0 ttl=64 time=0.226 ms
64 bytes from 4.1.1.2: icmp_seq=1 ttl=64 time=0.166 ms
64 bytes from 4.1.1.2: icmp_seq=2 ttl=64 time=0.107 ms
64 bytes from 4.1.1.2: icmp_seq=3 ttl=64 time=0.221 ms

--- 4.1.1.2 ping statistics ---
```

```
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.107/0.180/0.226/0.048 ms
```

5. From the access switch, ping the address of the vlan5 subinterface on the distribution switch:

```
user@access-switch> ping 5.1.1.2 count 4

PING 5.1.1.2 (5.1.1.2): 56 data bytes
64 bytes from 5.1.1.2: icmp_seq=0 ttl=64 time=0.224 ms
64 bytes from 5.1.1.2: icmp_seq=1 ttl=64 time=0.104 ms
64 bytes from 5.1.1.2: icmp_seq=2 ttl=64 time=0.102 ms
64 bytes from 5.1.1.2: icmp_seq=3 ttl=64 time=0.170 ms

--- 5.1.1.2 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.102/0.150/0.224/0.051 ms
```

Meaning If all the ping packets are transmitted and are received by the destination address, the subinterfaces are up and working.

Related Documentation

- Example: Connecting an Access Switch to a Distribution Switch on page 1078
- Configuring a Layer 3 Subinterface (CLI Procedure) on page 930

Example: Configuring Unicast RPF on a J-EX Series Switch

Unicast reverse-path forwarding (RPF) helps protect the switch against denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by verifying the unicast source address of each packet that arrives on an ingress interface where unicast RPF is enabled.

This example shows how to help defend the switch ingress interfaces against denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by configuring unicast reverse-path forwarding (RPF) on a customer-edge interface to filter incoming traffic:

Requirements

This example uses the following software and hardware components:

- Two J-EX8200 switches

Before you begin, be sure you have:

- Connected the two switches by symmetrically routed interfaces.
- Ensured that the interface on which you will configure unicast RPF is symmetrically routed.

Overview and Topology

Large amounts of unauthorized traffic such as attempts to flood a network with fake (bogus) service requests in a denial-of-service (DoS) attack can consume network resources and deny service to legitimate users. One way to help prevent DoS and distributed denial-of-service (DDoS) attacks is to verify that incoming traffic originates from legitimate network sources.

Unicast RPF helps ensure that a traffic source is legitimate (authorized) by comparing the source address of each packet that arrives on an interface to the forwarding-table entry for its source address. If the switch uses the same interface that the packet arrived on to reply to the packet's source, this verifies that the packet originated from an authorized source, and the switch forwards the packet. If the switch does not use the same interface that the packet arrived on to reply to the packet's source, the packet might have originated from an unauthorized source, and the switch discards the packet.

This example uses two J-EX8200 switches. On J-EX4200 switches, you cannot configure individual interfaces for unicast RPF. On J-EX4200 switches, the switch applies unicast RPF globally to all interfaces on the switch. See “Understanding Unicast RPF for J-EX Series Switches” on page 872 for more information on limitations regarding the configuration of unicast RPF on J-EX4200 switches.

In this example, an enterprise network's system administrator wants to protect Switch A against potential DoS and DDoS attacks from the Internet. The administrator configures unicast RPF on interface **ge-1/0/10** on Switch A. Packets arriving on interface **ge-1/0/10** on Switch A from the Switch B source also use incoming interface **ge-1/0/10** as the best return path to send packets back to the source.

The topology of this configuration example uses two J-EX8200 switches, Switch A and Switch B, connected by symmetrically routed interfaces:

- Switch A is on the edge of an enterprise network. The interface **ge-1/0/10** on Switch A connects to the interface **ge-1/0/5** on Switch B.
- Switch B is on the edge of the service provider network that connects the enterprise network to the Internet.

Configuration

To enable unicast RPF, perform these tasks:

CLI Quick Configuration

To quickly configure unicast RPF on Switch A, copy the following command and paste it into the switch terminal window:

```
[edit interfaces]
set ge-1/0/10 unit 0 family inet rpf-check
```

Step-by-Step Procedure

To configure unicast RPF on Switch A:

1. Enable unicast RPF on interface **ge-1/0/10**:

```
[edit interfaces]
user@switch# set ge-1/0/10 unit 0 family inet rpf-check
```

Results

Check the results:

```
[edit interfaces]
user@switch# show
ge-1/0/10 {
  unit 0 {
    family inet {
      rpf-check;
    }
  }
}
```

Verification

To confirm that the configuration is correct, perform these tasks:

- Verifying That Unicast RPF Is Enabled on the Switch on page 902

Verifying That Unicast RPF Is Enabled on the Switch

Purpose Verify that unicast RPF is enabled.

Action Verify that unicast RPF is enabled on interface **ge-1/0/10** by using the **show interfaces ge-1/0/10 extensive** or **show interfaces ge-1/0/10 detail** command.

```

- Configuring Unicast RPF (CLI Procedure) on page 927
- Disabling Unicast RPF (CLI Procedure) on page 928

Example: Configuring IP Directed Broadcast on a J-EX Series Switch

IP directed broadcast provides a method of sending broadcast packets to hosts on a specified subnet without broadcasting those packets to hosts on the entire network.

This example shows how to enable a subnet to receive IP directed broadcast packets so you can perform backups and other network management tasks remotely:

Requirements

This example uses the following software and hardware components:

- One PC
- One J-EX Series switch

Before you configure IP directed broadcast for a subnet:

- Ensure that the subnet does not have a direct connection to the Internet.
- Configure routed VLAN interfaces (RVIs) for the ingress and egress VLANs on the switch. See “Configuring Routed VLAN Interfaces (CLI Procedure)” on page 1137 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 1133.

Overview and Topology

You might want to perform remote administration tasks such as backups and wake-on-LAN (WOL) application tasks to manage groups of clients on a subnet. One way to do this is to send IP directed broadcast packets targeted at the hosts in a particular target subnet.

The network forwards IP directed broadcast packets as if they were unicast packets. When the IP directed broadcast packet is received by a VLAN that is enabled for **targeted-broadcast**, the switch broadcasts the packet to all the hosts in its subnet.

In this topology (see Figure 25 on page 905), a host is connected to an interface on a J-EX Series switch to manage the clients in subnet **10.1.2.1/24**. When the switch receives a packet with the broadcast IP address of the target subnet as its destination address, it forwards the packet to the subnet's Layer 3 interface and broadcasts it to all the hosts within the subnet.

Figure 25: Topology for IP Directed Broadcast

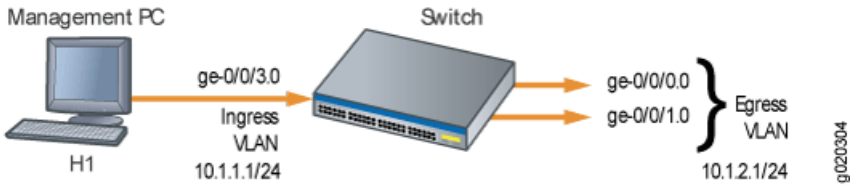

Table 122 on page 905 shows the settings of the components in this example.

Table 122: Components of the IP Directed Broadcast Topology

Property	Settings
Switch hardware	J-EX Series switch
Ingress VLAN name	**v0**
Ingress VLAN IP address	**10.1.1.1/24**
Egress VLAN name	**v1**
Egress VLAN IP address	**10.1.2.1/24**
Interfaces in VLAN **v0**	**ge-0/0/3.0**
Interfaces in VLAN **v1**	**ge-0/0/0.0** and **ge-0/0/1.0**

Configuration

To configure IP directed broadcast on a subnet to enable remote management of its hosts:

CLI Quick Configuration

To quickly configure the switch to accept IP directed broadcasts targeted at subnet **10.1.2.1/24**, copy the following commands and paste them into the switch's terminal window:

```
[edit]
set interfaces ge-0/0/0.0 family ethernet-switching vlan members v1
set interfaces ge-0/0/1.0 family ethernet-switching vlan members v1
set interfaces vlan.1 family inet address 10.1.2.1/24
set interfaces ge-0/0/3.0 family ethernet-switching vlan members v0
set interfaces vlan.0 family inet address 10.1.1.1/24
set vlans v1 l3-interface vlan.1
set vlans v0 l3-interface vlan.0
set interfaces vlan.1 family inet targeted-broadcast
```

Step-by-Step Procedure

To configure the switch to accept IP directed broadcasts targeted at subnet **10.1.2.1/24**:

1. Add logical interface **ge-0/0/0.0** to VLAN **v1**:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/0.0 family ethernet-switching vlan members v1
   ```

2. Add logical interface **ge-0/0/1.0** to VLAN **v1**:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/1.0 family ethernet-switching vlan members v1
   ```

3. Configure the IP address for the egress VLAN, **v1**:

   ```
   [edit interfaces]
   user@switch# set vlan.1 family inet address 10.1.2.1/24
   ```

4. Add logical interface **ge-0/0/3.0** to VLAN **v0**:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/3.0 family ethernet-switching vlan members v0
   ```

5. Configure the IP address for the ingress VLAN:

   ```
   [edit interfaces]
   user@switch# set vlan.0 family inet address 10.1.1.1/24
   ```

6. To route traffic between the ingress and egress VLANs, associate a Layer 3 interface with each VLAN:

   ```
   [edit vlans]
   user@switch# set v1 l3-interfacevlan.1
   user@switch# set v0 l3–interface vlan.0
   ```

7. Enable the Layer 3 interface for the egress VLAN to receive IP directed broadcasts:

   ```
   [edit interfaces]
   user@switch# set vlan.1 family inet targeted-broadcast
   ```

Results

Check the results:

```
user@switch# show
interfaces {
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        vlan {
```

```
            members v1;
          }
        }

CHAPTER 52

Configuring Interfaces

Configuring Gigabit Ethernet Interfaces (J-Web Procedure)

An Ethernet interface must be configured for optimal performance in a high-traffic network.

To configure properties on a Gigabit Ethernet interface or a 10-Gigabit Ethernet interface on a J-EX Series switch:

1. Select **Interfaces** > **Ports**.

   The page lists Gigabit Ethernet and 10-Gigabit Ethernet interfaces and their link status.

   NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Select the interface you want to configure. If the interface you want to configure is not listed under **Ports** in the top table on the page, select the FPC (the FPC is the line

card on a J-EX8200 switch or the member switch in a Virtual Chassis configuration) that includes that interface from the **List Ports for FPC** list.

Details for the selected interface such as administrative status, link status, speed, duplex, and flow control are displayed in the bottom table on the page.

NOTE: You can select multiple interfaces and modify their settings at the same time. When you do this, you cannot modify the IP address or enable or disable the administrative status of the selected interface.

3. Click **Edit** and select the set of options you want to configure first:

- Port Role—Enables you to assign a profile for the selected interface.

NOTE: When you select a particular port role, pre-configured port security parameters are set for the VLAN that the interface belongs to. For example, if you select the port role **Desktop**, the port security options **examine-dhcp** and **arp-inspection** are enabled on the VLAN that the interface belongs to. If there are interfaces in the VLAN that have static IP addresses, those interfaces might lose connectivity because those static IP addresses might not be present in the DHCP pool. Therefore, when you are selecting a port role, ensure that the corresponding port security settings for the VLAN are applicable to the interface.

For basic information on port security features such as DHCP snooping (CLI option **examine-dhcp**) or dynamic ARP inspection (DAI) (CLI option **arp-inspection**), see “Configuring Port Security (J-Web Procedure)” on page 2627. For detailed descriptions of port security features, see “Port Security for J-EX Series Switches Overview” on page 2545.

  Click **Details** to view the configuration parameters for the selected port role.

- VLAN Options—Enables you to configure VLAN options for the selected interface.
- Link Options—Enables you to modify the following link options for the selected interface:
  - Speed
  - MTU
  - Autonegotiation
  - Flow Control
  - Duplex
- IP Options—Enables you to configure an IP address for the interface.

4. Configure the interface by configuring options in the selected option set. See Table 123 on page 911 for details on options.
5. Repeat Steps 3 and 4 for the remaining option sets that you want to configure for the interface.

NOTE: To enable or disable the administrative status for a selected interface, click Enable Port or Disable Port.

Table 123: Port Edit Options

Field	Function	Your Action
Port Role	Specifies a profile (role) to assign to the interface. NOTE: Once a port role is configured on the interface, you cannot specify VLAN options or IP options. NOTE: Only the following port roles can be applied on J-EX8200 switch interfaces: • Default • Layer 2 uplink • Routed uplink	
Default	Applies the default role. The interface family is set to **ethernet-switching**, port mode is set to **access**, and RSTP is enabled.	1. Click **Details** to view CLI commands for this role. 2. Click **OK**.
Desktop	Applies the desktop role. The interface family is set to **ethernet-switching**, port mode is set to **access**, RSTP is enabled with the **edge** and **point-to-point** options, and port security parameters (MAC limit =1; dynamic ARP inspection and DHCP snooping enabled) are set.	1. Select an existing VLAN configuration or type the name of a new VLAN configuration to be associated with the interface. 2. Click **Details** to view CLI commands for this role. 3. Click **OK**.
Desktop and Phone	Applies the desktop and phone role. The interface family is set to **ethernet-switching**, port mode is set to **access**, port security parameters (MAC limit =1; dynamic ARP Inspection and DHCP snooping enabled) are set, and recommended CoS parameters are specified for forwarding classes, schedulers, and classifiers. See Table 124 on page 914 for more CoS information.	1. Select an existing VLAN configuration or type the name of a new VLAN configuration to be associated with the interface. You can also select an existing VoIP VLAN configuration or a new VoIP VLAN configuration to be associated with the interface. NOTE: VoIP is not supported on J-EX8200 switches. 2. Click **Details** to view CLI commands for this role. 3. Click **OK**.

Table 123: Port Edit Options *(continued)*

Field	Function	Your Action
Wireless Access Point	Applies the wireless access point role. The interface family is set to **ethernet-switching**, port mode is set to **access**, and RSTP is enabled with the **edge** and **point-to-point** options.	1. Select an existing VLAN configuration or type the name of a new VLAN configuration to be associated with the interface. Type the **VLAN ID** for a new VLAN. 2. Click **Details** to view CLI commands for this role. 3. Click **OK**.
Routed Uplink	Applies the routed uplink role. The interface family is set to **inet**, and recommended CoS parameters are set for schedulers and classifiers. See Table 124 on page 914 for more CoS information.	To specify an IPv4 address: 1. Select the check box **IPv4 address**. 2. Type an IP address—for example: **10.10.10.10**. 3. Enter the subnet mask or address prefix. For example, 24 bits represents **255.255.255.0**. 4. Click **OK**. To specify an IPv6 address: 1. Select the check box **IPv6 address**. 2. Type an IP address—for example: **2001:ab8:85a3::8a2e:370:7334**. 3. Enter the subnet mask or address prefix. 4. Click **OK**.
Layer 2 Uplink	Applies the Layer 2 uplink role. The interface family is set to **ethernet-switching**, port mode is set to **trunk**, RSTP is enabled with the **point-to-point** option, and port security is set to **dhcp-trusted**.	1. For this port role you can select a VLAN member and associate a native VLAN with the interface. 2. Click **Details** to view CLI commands for this role. 3. Click **OK**.
None	Specifies that no port role is configured for the selected interface.	

NOTE: See “Port Role Configuration with the J-Web InterfaceCLI Reference” on page 915 for details on the CLI commands that are associated with each port role.

NOTE: For a J-EX8200 switch, dynamic ARP inspection and DHCP snooping parameters are not configured.

VLAN Options

Table 123: Port Edit Options *(continued)*

Field	Function	Your Action
Port Mode	Specifies the mode of operation for the interface: trunk or access.	If you select **Trunk**, you can: 1. Click **Add** to add a VLAN member. 2. Select the VLAN and click **OK**. 3. (Optional) Associate a native VLAN with the interface. If you select **Access**, you can: 1. Select the VLAN member to be associated with the interface. 2. (Optional) Associate a VoIP VLAN with the interface. Only a VLAN with a VLAN ID can be associated as a VoIP VLAN. NOTE: VoIP is not supported on J-EX8200 switches. Click **OK**.
Link Options		
MTU (bytes)	Specifies the maximum transmission unit size for the interface.	Type a value from **256** through **9216**. The default MTU for Gigabit Ethernet interfaces is **1514**.
Speed	Specifies the speed for the mode.	Select one of the following values: 10 Mbps, 100 Mbps, 1000 Mbps, or Auto-Negotiation.
Duplex	Specifies the link mode.	Select one: **automatic**, **half**, or **full**.
Description	Describes the link. NOTE: If the interface is part of a link aggregation group (LAG), only the option **Description** is enabled.	Enter a brief description for the link.
Enable Auto Negotiation	Enables or disables autonegotiation.	Select the check box to enable autonegotiation, or clear the check box to disable it. By default, autonegotiation is enabled.
Enable Flow Control	Enables or disables flow control.	Select the check box to enable flow control to regulate the amount of traffic sent out of the interface, or clear the check box to disable flow control and permit unrestricted traffic. Flow control is enabled by default.
IP Options		

Table 123: Port Edit Options *(continued)*

Field	Function	Your Action
IPv4 Address	Specifies an IPv4 address for the interface. NOTE: If the IP address is cleared, the interface still belongs to the **inet** family.	1. To specify an IPv4 address, select the check box **IPv4 address**. 2. Type an IP address—for example: **10.10.10.10**. 3. Enter the subnet mask or address prefix. For example, 24 bits represents **255.255.255.0**. 4. Click **OK**.
IPv6 Address	Specifies an IPv6 address for the interface. NOTE: If the IP address is cleared, the interface still belongs to the **inet** family.	1. To specify an IPv6 address, select the check box **IPv6 address**. 2. Type an IP address—for example: **2001:ab8:85a3::8a2e:370:7334**. 3. Enter the subnet mask or address prefix. 4. Click **OK**.

Table 124: Recommended CoS Settings for Port Roles

CoS Parameter	Recommended Settings
Forwarding Classes	There are four forwarding classes: • **voice**—Queue number is set to 7. • **expedited-forwarding**—Queue number is set to 5. • **assured-forwarding**—Queue number is set to 1. • **best-effort**—Queue number is set to 0.
Schedulers	The schedulers and their settings are: • Strict-priority—Transmission rate is set to 10 percent and buffer size to 5 percent. • Expedited-scheduler—Transmission rate is set to 30 percent, buffer size to 30 percent, and priority to **low**. • Assured-scheduler—Transmission rate is set to 25 percent, buffer size to 25 percent, and priority to **low**. • Best-effort scheduler—Transmission rate is set to 35 percent, buffer size to 40 percent, and priority to **low**.
Scheduler maps	When a desktop and phone, routed uplink, or layer 2 uplink role is applied on an interface, the forwarding classes and schedulers are mapped using the scheduler map.
ieee-802.1 classifier	Imports the default **ieee-802.1** classifier configuration and sets the loss priority to **low** for the code point 101 for the **voice** forwarding class.
dscp classifier	Imports the default **dscp** classifier configuration and sets the loss priority to **low** for the code point 101110 for the **voice** forwarding class.

Port Role Configuration with the J-Web Interface (with CLI References)

When you configure Gigabit Ethernet interface properties with the J-Web interface (Configure > Interfaces) you can optionally select pre-configured port roles for those interfaces. When you select a role from the **Port Role** field and apply it to a port, the J-Web interface modifies the switch configuration using CLI commands. Table 125 on page 915 lists the CLI commands applied for each port role.

NOTE: If there is an existing port role configuration, it is cleared before the new port role configuration is applied.

Table 125: Port Role Configuration Summary

Configuration Description	CLI Commands
Default Port Role	
Set the port role to **Default**.	`set interfaces interfaceapply-macro juniper-port-profile Default`
Set port family to **ethernet-switching**. Set port mode to **access**.	`set interfaces interface unit 0 family ethernet-switching port-mode access`
Enable RSTP if redundant trunk groups are not configured.	`delete protocols rstp interface interface disable`
Disable RSTP if redundant trunk groups are configured.	`set protocols rstp interface interface disable`
Desktop Port Role	
Set the port role to desktop.	`set interfaces interface apply-macro juniper-port-profile Desktop`
Set VLAN if new VLAN is specified.	set vlans <*vlan name*> vlan-id <*vlan-id*>
Set port family to **ethernet-switching**. Set Port Mode to **Access**.	`set interfaces interface unit 0 family ethernet-switching port-mode access`
Set VLAN if new VLAN is specified.	`set interfaces interface unit 0 family ethernet-switching vlan members vlan-members`
Set port security parameters.	`set ethernet-switching-options secure-access-port vlan MacTest arp-inspection`
Set RSTP protocol with **edge** option.	`set protocols rstp interface interface edge`

Table 125: Port Role Configuration Summary *(continued)*

Configuration Description	CLI Commands
RSTP protocol is disabled if redundant trunk groups are configured.	`set protocols rstp interface interface disable`
Desktop and Phone Port Role	
Set the port role to desktop and phone.	`set interfaces interfaceapply-macro juniper-port-profile Desktop and Phone`
Set data VLAN if new VLAN is specified. Set voice VLAN if new voice VLAN is specified.	`set vlans vlan-namevlan-id vlan id`
Set port family to **ethernet-switching.** Set Port Mode to **access**.	`set interfaces interfaceunit 0 family ethernet-switching port-mode access`
Set data VLAN on port stanza.	`set interfaces interface unit 0 family ethernet-switching vlan members vlan-members`
Set port security parameters.	`set ethernet-switching-options secure-access-port vlan MacTest arp-inspection`
Set VOIP VLAN.	`set ethernet-switching-options voip interface interface.0 vlan vlan vlan name`

Set class of service parameters
 	
SCHEDULER_MAP=juniper-port-profile-map
 	
IEEE_CLASSIFIER=juniper-ieee-classifier
 	
DSCP_CLASSIFIER=juniper-dscp-classifier
	`set class-of-service interfaces interfacescheduler-map juniper-port-profile-map`
	`set class-of-service interfaces interface unit 0 classifiers ieee-802.1 juniper_ieee_classifier`
	`set class-of-service interfaces interfaceunit 0 classifiers dscp juniper-dscp-classifier`

Set CoS Configuration	Refer to Table 126 on page 918 for details.
Wireless Access Point Port Role	
Set the port role to wireless access point.	`set interfaces interface apply-macro juniper-port-profile Wireless Access Point`
Set VLAN on VLANs stanza.	`set vlans vlan namevlan-id vlan-id`
Set port family to **ethernet-ewitching** Set port mode to **Access**.	`set interfaces interface unit 0 family ethernet-switching port-mode access`
Set VLAN on port stanza.	`set interfaces interface unit 0 family ethernet-switching vlan members vlan-members`
Set RSTP protocol with edge option.	`set protocols rstp interface interface edge`
RSTP protocol is disabled if redundant trunk groups are configured.	`set protocols rstp interface interface disable`
Routed Uplink Port Role	

Table 125: Port Role Configuration Summary *(continued)*

Configuration Description	CLI Commands
Set the port role to Routed Uplink.	`set interfaces interface apply-macro juniper-port-profile Routed Uplink`
Set port family to inet. Set IP address on the port.	`set interfaces interfaceunit 0 family inet address ipaddress`

Set class-of-service parameters
 	
SCHEDULER_MAP=juniper-port-profile-map
 	
IEEE_CLASSIFIER=juniper-ieee-classifier
 	
DSCP_CLASSIFIER=juniper-dscp-classifier
	`set class-of-service interfaces interfacescheduler-map juniper-port-profile-map`
	`set class-of-service interfaces interface unit 0 classifiers ieee-802.1 juniper_ieee_classifier`
	`set class-of-service interfaces interfaceunit 0 classifiers dscp juniper-dscp-classifier`

Set CoS configuration	Refer to Table 126 on page 918 for details.
Layer 2 Uplink Port Role	
Set the port role to **Layer 2 Uplink**.	`set interfaces interface apply-macro juniper-port-profile Layer2 Uplink`
Set port family to **ethernet-switching** Set port mode to **trunk**.	`set interfaces interface unit 0 family ethernet-switching port-mode trunk`
Set Native VLAN name.	`set interfaces interface unit 0 family ethernet-switching native-vlan-id vlan-name`
Set the port as part of all valid VLANs; "valid" refers to all VLANs except native VLAN and voice VLANs.	`set interfaces interface unit 0 family ethernet-switching vlan members vlan-members`
Set port security parameter.	`set ethernet-switching-options secure-access-port dhcp-trusted`
Set RSTP protocol with point-to-point option.	`set protocols rstp interface interface mode point-to-point`
Disable RSTP if redundant trunk groups are configured.	`set protocols rstp interface interface disable`

Set class-of-service parameters.
 	
SCHEDULER_MAP=juniper-port-profile-map
 	
IEEE_CLASSIFIER=juniper_ieee_classifier
 	
DSCP_CLASSIFIER=juniper_dscp_classifier
	`set class-of-service interfaces interfacescheduler-map juniper-port-profile-map`
	`set class-of-service interfaces interface unit 0 classifiers ieee-802.1 juniper_ieee_classifier`
	`set class-of-service interfaces interfaceunit 0 classifiers dscp juniper-dscp-classifier`

Set CoS configuration	Refer to Table 126 on page 918 for details.

Table 126 on page 918 lists the CLI commands for the recommended CoS settings that are committed when the CoS configuration is set.

Table 126: Recommended CoS Settings for Port Roles

CoS Parameter	CLI Command
Forwarding Classes	
voice	`set class-of-service forwarding-classes class voice queue-num 7`
expedited-forwarding	`set class-of-service forwarding-classes class expedited-forwarding queue-num 5`
assured-forwarding	`set class-of-service forwarding-classes class assured-forwarding queue-num 1`
best-effort	`set class-of-service forwarding-classes class best-effort queue-num 0`
Schedulers	

strict-priority-scheduler	The CLI commands are:
	
	`set class-of-service schedulers strict-priority-scheduler transmit-rate percent 10`
	`set class-of-service schedulers strict-priority-scheduler buffer-size percent 5`
	`set class-of-service schedulers strict-priority-scheduler priority strict-high`

expedited-scheduler	The CLI commands are:
	
	`set class-of-service schedulers expedited-scheduler transmit-rate percent 30`
	`set class-of-service schedulers expedited-scheduler buffer-size percent 30`
	`set class-of-service schedulers expedited-scheduler priority low`

assured-scheduler	The CLI commands are:
	
	`set class-of-service schedulers assured-scheduler transmit-rate percent 25`
	`set class-of-service schedulers strict-priority-scheduler buffer-size percent 25`
	`set class-of-service schedulers strict-priority-scheduler priority low`

best-effort-scheduler	The CLI commands are:
	
	`set class-of-service schedulers best-effort-scheduler transmit-rate percent 35`
	`set class-of-service schedulers best-effort-scheduler buffer-size percent 40`
	`set class-of-service schedulers best-effort-scheduler priority low`

Classifiers	The classifiers are:
	
	`set class-of-service classifiers ieee-802.1 juniper_ieee_classifier import default forwarding-class voice loss-priority low code-points 101`
	`set class-of-service classifiers dscp juniper_dscp_classifier import default forwarding-class voice loss-priority low code-points 101110`

Related Documentation

- Configuring Gigabit Ethernet Interfaces (J-Web Procedure) on page 909
- Configuring Gigabit Ethernet Interfaces (CLI Procedure) on page 919

Configuring Gigabit Ethernet Interfaces (CLI Procedure)

An Ethernet interface must be configured for optimal performance in a high-traffic network. J-EX Series switches include a factory default configuration that:

- Enables all the network interfaces on the switch
- Sets a default port mode (access)
- Sets default link settings
- Specifies a logical unit (**unit 0**) and assigns it to **family ethernet-switching** (except on J-EX8200 switches)
- Specifies Rapid Spanning Tree Protocol (RSTP) and Link Layer Discovery Protocol (LLDP)

This topic describes:

- Configuring VLAN Options and Port Mode on page 919
- Configuring the Link Settings on page 919
- Configuring the IP Options on page 920

Configuring VLAN Options and Port Mode

The factory default configuration includes a default VLAN and enables interfaces for the access port mode. Access interfaces typically connect to network devices such as PCs, printers, IP telephones, and IP cameras.

If you are connecting a desktop phone or wireless access point or a security camera to a Power over Ethernet (PoE) port, you can configure some parameters for the PoE interface. The PoE interfaces are enabled by default. For detailed information on PoE settings, see “Configuring PoE (CLI Procedure)” on page 3021.

If you are connecting a device to other switches and to routers on the LAN, you need to assign the interface to a logical port and configure the logical port as a trunk port. See “Port Role Configuration with the J-Web Interface (with CLI References)” on page 915 for more information about port configuration.

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for trunk port mode:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching
port-mode trunk
```

Configuring the Link Settings

J-EX Series switches include a factory default configuration that enables interfaces with the following link settings:

- All Gigabit Ethernet interfaces are set to **auto-negotiation**.
- The speed for Gigabit Ethernet interfaces is set to **auto**, allowing the interface to operate at 10m, 100m or 1g. The link operates at the highest possible speed, depending on the capabilities of the remote end.
- The flow control for Gigabit Ethernet interfaces and 10-Gigabit Ethernet interfaces is set to **enabled**.
- The link mode is set to **auto**, allowing the interface to operate as either full duplex or half duplex. The link operates as full duplex unless this mode is not supported at the remote end.
- The 10-Gigabit Ethernet interfaces default to **no auto-negotiation**. The default speed is 10g and the default link mode is full duplex.

To configure the link settings:

- Set link settings for a Gigabit Ethernet interface:

```
[edit]
user@switch# set interfaces ge-fpc/pic/port ether-options
```

- Set link settings for a 10-Gigabit Ethernet interface:

```
[edit]
user@switch# set interfaces xe-fpc/1/port ether-options
```

NOTE: An uplink port in a J-EX4200 switch always has a PIC value of 1.

For a J-EX4200 standalone switch, *fpc* refers to the switch itself and is always 0. In a Virtual Chassis configuration, *fpc* refers to the member ID. In a J-EX8200 switch, *fpc* refers to the line card number.

The **ether-options** statement allows you to modify the configuration:

- **802.3ad**—Specify an aggregated Ethernet bundle. See "Configuring Aggregated Ethernet Interfaces (CLI Procedure)" on page 922.
- **auto-negotiation**—Enable or disable autonegotation of flow control, link mode, and speed.
- **flow-control**—Enable or disable flow control.
- **link-mode**—Specify **full-duplex**, **half-duplex**, or **automatic**.
- **speed**—Specify **10m**, **100m**, **1g**, or **autonegotiation**.

Configuring the IP Options

To specify an IP address for the logical unit using IPv4:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

To specify an IP address for the logical unit using IPv6:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet6 address
ip-address
```

NOTE: Access interfaces on J-EX4200 switches are set to family ethernet-switching by default. You might have to delete this or another user-configured family setting before changing the setting to family inet or family inet6.

Setting the Mode on an SFP+ Uplink Module (CLI Procedure)

SFP+ uplink modules are supported on J-EX4200 switches. You can use these uplink modules either for two SFP+ transceivers or four SFP transceivers. You configure the operating mode on the module to match the type of transceiver you want to use—that is, for SFP+ transceivers, you configure the 10-gigabit operating mode, and for SFP transceivers, you configure the 1-gigabit operating mode.

By default, the SFP+ uplink module operates in the 10-gigabit mode and supports only SFP+ transceivers. If you have not changed the module from the default setting and you want to use SFP+ transceivers, you do not need to configure the operating mode.

To set the operating mode of an SFP+ uplink module, change the operating mode to the appropriate mode for the transceiver type you want to use by using one of the following commands:

```
[edit]
user@switch# set chassis fpc 0 pic 1 sfpplus pic-mode 1g
```

```
[edit]
user@switch# set chassis fpc 0 pic 1 sfpplus pic-mode 10g
```

The changed operating mode takes effect immediately unless a port on the SFP+ uplink module is a Virtual Chassis port (VCP). If any port on the SFP+ uplink module is a VCP, the changed operating mode does not take effect until the next reboot of the switch.

NOTE: During the operating mode change, the Packet Forwarding Engine is restarted. In a Virtual Chassis configuration, this means that the Flexible PIC Concentrator connection with the master is dropped and then reconnected.

You can see whether the operating mode has been changed to the new mode you configured by issuing the **show chassis pic fpc-slot *slot-number* pic-slot 1** command.

Configuring Aggregated Ethernet Interfaces (CLI Procedure)

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases availability.

NOTE: An interface with an already configured IP address cannot form part of the aggregation group.

To configure aggregated Ethernet interfaces, using the CLI:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2
```

2. Specify the minimum number of links for the aggregated Ethernet interface (ae*x*), that is, the defined bundle, to be labeled “up”:

NOTE: By default only one link must be up for the bundle to be labeled “up”.

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options minimum-links 2
```

3. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options link-speed 10g
```

4. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set xe-0/1/0 ether-options 802.3ad ae0
user@switch# set xe-1/1/0 ether-options 802.3ad ae0
```

5. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set ae0 unit 0 family inet address 192.0.2.0/25
```

For information about adding LACP to a LAG, see “Configuring Aggregated Ethernet LACP (CLI Procedure)” on page 926.

- Verifying the Status of a LAG Interface on page 932
- Understanding Aggregated Ethernet Interfaces and LACP on page 867

Configuring Aggregated Ethernet Interfaces (J-Web Procedure)

Use the link aggregation feature to aggregate one or more Ethernet interfaces to form a virtual link or link aggregation group (LAG) on a J-EX Series switch. The MAC client can treat this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases availability. You can use the J-Web interface to configure aggregated Ethernet interfaces, or a LAG, on the switch.

NOTE: Interfaces that are already configured with MTU, duplex, flow control, or logical interfaces are listed but are not available for aggregation.

To configure an aggregated Ethernet interface (also referred to as a LAG):

1. Select **Configure** > **Interfaces** > **Link Aggregation**.

   The list of aggregated interfaces is displayed.

   

   NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one of the following:
   - **Add**—Creates an aggregated Ethernet interface, or LAG. Enter information as specified in Table 127 on page 924.
   - **Edit**—Modifies a selected LAG.
     - **Aggregation**—Modifies settings for the selected LAG. Enter information as specified in Table 127 on page 924.
     - **VLAN**—Specifies VLAN options for the selected LAG. Enter information as specified in Table 128 on page 925.
     - **IP Option**—Specifies IP options for the selected LAG. Enter information as specified in Table 129 on page 925.
   - **Delete**—Deletes the selected LAG.

- **Disable Port** or **Enable Port**—Disables or enables the administrative status on the selected interface.
- **Device Count**—Configures the number of aggregated logical devices available to the switch. Select the number and click **OK**.

Table 127: Aggregated Ethernet Interface Options

Field	Function	Your Action
Aggregated Interface	Specifies the name of the aggregated interface.	None. The name is supplied by the software.
LACP Mode	Specifies the mode in which LACP packets are exchanged between the interfaces. The modes are: • **None**—Indicates that no mode is applicable. • **Active**—Indicates that the interface initiates transmission of LACP packets • **Passive**—Indicates that the interface responds only to LACP packets.	Select from the list.
Description	Specifies a description for the LAG.	Enter a description.
Interface	Specifies the interfaces in the LAG.	To add interfaces to the LAG, select the interfaces and click **Add**. Click **OK**. To remove an interface from the LAG, select the interface and click **Remove**. NOTE: Only interfaces that are configured with the same speed can be selected together for a LAG.
Enable Log	Specifies whether to enable generation of log entries for the LAG.	Select the check box to enable log generation, or clear the check box to disable log generation.

Table 128: VLAN Options

Field	Function	Your Action
Port Mode	Specifies the mode of operation for the port: trunk or access.	If you select **Trunk**, you can: 1. Click **Add** to add a VLAN member. 2. Select the VLAN and click **OK**. 3. (Optional) Associate a native VLAN ID with the port. If you select **Access**, you can: 1. Select the VLAN member to be associated with the port. 2. (Optional) Associate a VoIP VLAN with the interface. Only a VLAN with a VLAN ID can be associated as a VoIP VLAN. Click **OK**.

Table 129: IP Options

Field	Function	Your Action
IPv4 Address	Specifies an IPv4 address for the selected LAG.	1. Select the check box **IPv4 address**. 2. Type an IP address—for example, **10.10.10.10**. 3. Enter the subnet mask or address prefix. For example, 24 bits represents **255.255.255.0**. 4. Click **OK**.
IPv6 Address	Specifies an IPv6 address for the selected LAG.	1. Select the check box **IPv6 address**. 2. Type an IP address—for example, **2001:ab8:85a3::8a2e:370:7334**. 3. Enter the subnet mask or address prefix. 4. Click **OK**.

Configuring Aggregated Ethernet LACP (CLI Procedure)

For aggregated Ethernet interfaces on J-EX Series switches, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

Before you configure LACP, be sure you have:

- Configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs). See "Configuring Aggregated Ethernet Interfaces (CLI Procedure)" on page 922

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as **active** for the link to be up.

NOTE: Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Enable one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic fast
```

Configuring Unicast RPF (CLI Procedure)

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Enabling unicast RPF on the switch interfaces filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. When a packet comes into an interface, if that interface is not the best return path to the source, the switch discards the packet. If the incoming interface is the best return path to the source, the switch forwards the packet.

NOTE: On J-EX4200 switches, you can only enable unicast RPF globally, on all switch interfaces. You cannot enable unicast RPF on a per-interface basis.

Before you begin:

- On a J-EX8200 switch, ensure that the selected switch interface is symmetrically routed before you enable unicast RPF. A symmetrically routed interface is an interface that uses the same route in both directions between the source and the destination. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.
- On a J-EX4200 switch, ensure that *all* switch interfaces are symmetrically routed before you enable unicast RPF on an interface. When you enable unicast RPF on any interface, it is enabled globally on all switch interfaces. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.

To enable unicast RPF, configure it explicitly on a selected customer-edge interface:

```
[edit interfaces]
user@switch# set ge-1/0/10 unit 0 family inet rpf-check
```

BEST PRACTICE: On J-EX4200 switches, unicast RPF is enabled globally on *all* switch interfaces, regardless of whether you configure it explicitly on only one interface or only on some interfaces.

On J-EX4200 switches, we recommend that you enable unicast RPF explicitly on either all interfaces or only one interface. To avoid possible confusion, do not enable it on only some interfaces:

- Enabling unicast RPF explicitly on only one interface makes it easier if you choose to disable it in the future because you must explicitly disable unicast RPF on every interface on which you explicitly enabled it. If you explicitly enable unicast RPF on two interfaces and you disable it on only one interface, unicast RPF is still implicitly enabled globally on the switch. The drawback to this approach is that the switch displays the flag that indicates

that unicast RPF is enabled only on interfaces on which unicast RPF is explicitly enabled, so even though unicast RPF is enabled on all interfaces, this status is not displayed.

- Enabling unicast RPF explicitly on all interfaces makes it easier to know whether unicast RPF is enabled on the switch because every interface shows the correct status. (Only interfaces on which you explicitly enable unicast RPF display the flag that indicates that unicast RPF is enabled.) The drawback to this approach is that if you want to disable unicast RPF, you must explicitly disable it on every interface. If unicast RPF is enabled on any interface, it is implicitly enabled on all interfaces.

Disabling Unicast RPF (CLI Procedure)

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Unicast RPF filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. If the network configuration changes so that an interface that has unicast RPF enabled becomes a trusted interface or becomes asymmetrically routed (the interface that receives a packet is not the best return path to the packet's source), disable unicast RPF.

To disable unicast RPF on a J-EX4200 switch, you must delete it from every interface on which you explicitly configured it. If you do not disable unicast RPF on every interface on which you explicitly enabled it, it remains implicitly enabled on all interfaces. If you attempt to delete unicast RPF from an interface on which it was not explicitly enabled, the message **warning: statement not found** displays. If you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces of the J-EX4200 switch.

On J-EX8200 switches, the switch does not apply unicast RPF to an interface unless you explicitly enable that interface for unicast RPF.

To disable unicast RPF, delete its configuration from the interface:

```
[edit interfaces]
user@switch# delete ge-1/0/10 unit 0 family inet rpf-check
```

NOTE: On J-EX4200 switches, if you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces.

Configuring IP Directed Broadcast (CLI Procedure)

You can use IP directed broadcast on a J-EX Series switch to facilitate remote network management by sending broadcast packets to hosts on a specified subnet without broadcasting to the entire network. IP directed broadcast packets are broadcast on only the target subnet. The rest of the network treats IP directed broadcast packets as unicast packets and forwards them accordingly.

Before you begin to configure IP directed broadcast:

- Ensure that the subnet on which you want broadcast packets using IP direct broadcast is not directly connected to the Internet.
- Configure a routed VLAN interface (RVI) for the subnet that will be enabled for IP direct broadcast. See “Configuring Routed VLAN Interfaces (CLI Procedure)” on page 1137 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 1133.

NOTE: We recommend that you do not enable IP directed broadcast on subnets that have a direct connection to the Internet because of increased exposure to denial-of-service (DoS) attacks.

To enable IP directed broadcast for a specified subnet:

1. Add the target subnet’s logical interfaces to the VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/0.0 family ethernet-switching vlan members v1

user@switch# set ge-0/0/1.0 family ethernet-switching vlan members v1
```

2. Configure the Layer 3 interface on the VLAN that is the target of the IP directed broadcast packets:

```
[edit interfaces]
user@switch# set vlan.1 family inet address 10.1.2.1/24
```

3. Associate a Layer 3 interface with the VLAN:

```
[edit vlans]
user@switch# set v1 l3-interface vlan.1
```

4. Enable the Layer 3 interface for the VLAN to receive IP directed broadcasts:

```
[edit interfaces]
user@switch# set vlan.1 family inet targeted-broadcast
```

Related Documentation

Configuring a Layer 3 Subinterface (CLI Procedure)

J-EX Series switches use Layer 3 subinterfaces to divide a physical interface into multiple logical interfaces, each corresponding to a VLAN. The switch uses the Layer 3 subinterfaces to route traffic between subnets.

To configure Layer 3 subinterfaces, you enable VLAN tagging and partition one or more physical ports into multiple logical interfaces, each corresponding to a VLAN ID.

Before you begin, make sure you set up your VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 1136 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 1133.

To configure Layer 3 subinterfaces:

1. Enable VLAN tagging:

```
[edit interfaces interface-name]
user@switch# set vlan-tagging
```

2. Bind each VLAN ID to a logical interface:

```
[edit interfaces interface-name]
user@switch# set unit logical-unit-number vlan-id vlan-id-number
```

CHAPTER 53

Verifying Interfaces

Monitoring Interface Status and Traffic

Purpose Use the monitoring functionality to view interface status or to monitor interface bandwidth utilization and traffic statistics on the J-EX Series switches.

The J-Web interface monitors interface bandwidth utilization and plots real-time charts to display input and output rates in bytes per second. In addition, the Interface monitoring page displays input and output packet counters and error counters in the form of charts.

Alternatively, you can enter the show commands in the CLI to view interface status and traffic statistics.

Action To view general interface information in the J-Web interface such as available interfaces, select **Monitor > Interfaces**. Click any interface to view details about its status.

To set up interface monitoring for Virtual Chassis and J-EX8200 switches, select a member from the **Port for FPC** list. Details such as the admin status and link status are displayed in the table.

NOTE: By default, the details of the first member in the Port for FPC drop-down list is displayed.

You have the following options:

- **Start/Stop**—Starts or stops monitoring the selected interface.
- **Show Graph**—Displays input and output packet counters and error counters in the form of charts. Also, click on the pop-up icon to view the graph in a separate window.

- **Details**—Displays interface information such as general details, traffic statistics, I/O errors, CoS counters, and Ethernet statistics.
- **Refresh Interval (sec)**—Displays the time interval you have set for page refresh.
- **Clear Statistics**—Clears the statistics for the interface selected from the table.

Using the CLI:

- To view interface status for all the interfaces, enter **show interfaces xe-**.
- To view status and statistics for a specific interface, enter **show interfaces xe-*interface-name***.
- To view status and traffic statistics for all interfaces, enter either **show interfaces xe- detail** or **show interfaces xe- extensive**.

Meaning In the J-Web interface the charts displayed are:

- Bar charts—Display the input and output error counters.
- Pie charts—Display the number of broadcast, unicast, and multicast packet counters.

For details about output from the CLI commands, see **show interfaces ge-** (Gigabit Ethernet) or **show interfaces xe-** (10-Gigabit Ethernet).

- Configuring Gigabit Ethernet Interfaces (CLI Procedure) on page 919

Verifying the Status of a LAG Interface

Purpose Verify that a LAG (**ae0**) has been created on the switch.

Action **show interfaces aeo terse**

```
Interface             Admin   Link  Proto      Local             Remote

ae0                    up       up

ae0.0                  up       up     inet     10.10.10.2/24
```

Meaning The output confirms that the **ae0** link is up and shows the **family** and IP address assigned to this link.

Related Documentation
- Configuring Aggregated Ethernet Interfaces (CLI Procedure) on page 922
- Configuring Aggregated Ethernet Interfaces (J-Web Procedure) on page 923

- Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch on page 740

Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets

To verify that LACP has been set up correctly and that the bundle members are transmitting LACP protocol packets.

1. Verifying the LACP Setup on page 933
2. Verifying That the LACP Packets Are Being Exchanged on page 933

Verifying the LACP Setup

Purpose Verify that the LACP has been set up correctly.

Action Use the **show lacp interfaces *interface-name*** command to check that LACP has been enabled as active on one end.

show lacp interfaces xe-0/1/0

```
show lacp interfaces xe-0/1/0

Aggregated interface: ae0

    LACP state:       Role   Exp   Def  Dist  Col  Syn  Aggr  Timeout  Activity

      xe-0/1/0      Actor    No   Yes    No   No   No   Yes     Fast    Active

      xe-0/1/0    Partner    No   Yes    No   No   No   Yes     Fast   Passive

    LACP protocol:   Receive State    Transmit State          Mux State

      xe-0/1/0          Defaulted     Fast periodic           Detached
```

Meaning This example shows that LACP has been configured with one side as **active** and the other as **passive**. When LACP is enabled, one side must be set as **active** in order for the bundled link to be **up**.

Verifying That the LACP Packets Are Being Exchanged

Purpose Verify that LACP packets are being exchanged between interfaces.

Action Use the **show interfaces ae*x* statistics** command to display LACP BPDU exchange information.

show interfaces ae0 statistics

```
Physical interface: ae0, Enabled, Physical link is Down
  Interface index: 153, SNMP ifIndex: 30
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
```

```
Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1,
Minimum bandwidth needed: 0
Device flags   : Present Running
Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
Current address: 02:19:e2:50:45:e0, Hardware address: 02:19:e2:50:45:e0
Last flapped   : Never
Statistics last cleared: Never
  Input packets : 0
  Output packets: 0
Input errors: 0, Output errors: 0

Logical interface ae0.0 (Index 71) (SNMP ifIndex 34)
  Flags: Hardware-Down Device-Down SNMP-Traps Encapsulation: ENET2
  Statistics        Packets        pps         Bytes          bps
  Bundle:
      Input :             0          0             0            0
      Output:             0          0             0            0
  Protocol inet,
    Flags: None
    Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
      Destination: 10.10.10/24, Local: 10.10.10.1, Broadcast: 10.10.10.255
```

Meaning The output here shows that the link is down and that no PDUs are being exchanged (when there is no other traffic flowing on the link).

Related Documentation

- Configuring Aggregated Ethernet LACP (CLI Procedure) on page 926
- Verifying the Status of a LAG Interface on page 932

Verifying That Layer 3 Subinterfaces Are Working

Purpose After configuring Layer 3 subinterfaces, verify they are set up properly and transmitting data.

Action

1. Use the **show interfaces** command to determine if you successfully created the subinterfaces and the links are up:

   ```
   user@switch> show interfaces interface-name terse

   Interface               Admin Link Proto    Local                 Remote
   ge-0/0/0                up    up
   ge-0/0/0.0              up    up   inet     1.1.1.1/24
   ge-0/0/0.1              up    up   inet     2.1.1.1/24
   ge-0/0/0.2              up    up   inet     3.1.1.1/24
   ge-0/0/0.3              up    up   inet     4.1.1.1/24
   ge-0/0/0.4              up    up   inet     5.1.1.1/24
   ge-0/0/0.32767          up    up
   ```

2. Use the **ping** command from a device on one subnet to an address on another subnet to determine if packets were transmitted correctly on the subinterface VLANs:

   ```
   user@switch> ping ip-address
   ```

```
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=64 time=0.157 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=64 time=0.238 ms
64 bytes from 1.1.1.1: icmp_seq=2 ttl=64 time=0.255 ms
64 bytes from 1.1.1.1: icmp_seq=3 ttl=64 time=0.128 ms
--- 1.1.1.1 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
```

Meaning The output confirms that the subinterfaces are created and the links are up.

Verifying Unicast RPF Status

Purpose Verify that unicast reverse-path forwarding (RPF) is enabled and is working on the interface.

Action Use one of the **show interfaces *interface-name*** commands with either the **extensive** or **detail** options to verify that unicast RPF is enabled and working on the switch. The example below displays output from the **show interfaces ge- extensive** command.

```
user@switch> show interfaces ge-1/0/10 extensive

 Output bytes  :                0
 Input  packets:                0
 Output packets:                0
   Protocol inet, Generation: 144, Route table: 0
 Flags: uRPF
 Addresses, Flags: Is-Preferred Is-Primary
```

Meaning The **show interfaces ge-1/0/10 extensive** command (and the **show interfaces ge-1/0/10 detail** command) displays in-depth information about the interface. The **Flags:** output field near the bottom of the display reports the unicast RPF status. If unicast RPF has not been enabled, the **uRPF** flag is not displayed.

On J-EX4200 switches, unicast RPF is implicitly enabled on *all* switch interfaces, including aggregated Ethernet interfaces (also referred to as link aggregation groups or LAGs) and routed VLAN interfaces (RVIs) when you enable unicast RPF on a single interface. However, the unicast RPF status is shown as enabled only on interfaces for which you have explicitly configured unicast RPF. Thus, the **uRPF** flag is not displayed on interfaces for which you have not explicitly configured unicast RPF even though unicast RPF is implicitly enabled on all interfaces on J-EX4200 switches.

Verifying IP Directed Broadcast Status

Purpose Verify that IP directed broadcast is enabled and is working on the subnet.

Action Use the **show vlans extensive** command to verify that IP directed broadcast is enabled and working on the subnet as shown in the following example.

Related Documentation

CHAPTER 54

Troubleshooting Interfaces

Troubleshooting Network Interfaces on J-EX4200 Switches

This topic provides troubleshooting information for specific problems related to interfaces on J-EX4200 switches.

The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP+ uplink module is down

Problem The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP+ uplink module installed in a J-EX4200 switch is down.

When you check the status with the CLI command **show interfaces ge-** or with the J-Web user interface, the disabled port is not listed.

Cause By default, the SFP+ uplink module operates in the 10-gigabit mode and supports only SFP+ transceivers. The operating mode for the module is incorrectly set.

Solution Either SFP+ or SFP transceivers can be installed in SFP+ uplink modules. You must configure the operating mode of the SFP+ uplink module to match the type of transceiver you want to use. For SFP+ transceivers, configure the 10-gigabit operating mode and for SFP transceivers, configure the 1-gigabit operating mode. See “Setting the Mode on an SFP+ Uplink Module (CLI Procedure)” on page 921.

- Uplink Modules in J-EX4200 Switches
- J-EX Series Switches Interfaces Overview on page 863

Troubleshooting an Aggregated Ethernet Interface

Problem The **show interfaces terse** command shows that the LAG is down.

Solution Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet—switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch (or the same Virtual Chassis).

Related Documentation

Troubleshooting Interface Configuration and Cable Faults

Troubleshooting interface configuration and connectivity on the J-EX Series switch:

1. Interface Configuration or Connectivity Is Not Working on page 940

Interface Configuration or Connectivity Is Not Working

Problem You encounter errors when you attempt to configure an interface on the switch, or the interface is exhibiting connectivity problems.

Solution Use the port troubleshooter feature in the J-Web interface to identify and rectify port configuration and connectivity related problems.

To use the J-Web interface port troubleshooter:

1. Select the option **Troubleshoot** from the main menu.
2. Click **Troubleshoot Port**. The Port Troubleshooting wizard is displayed. Click **Next**.

3. Select the ports to troubleshoot.
4. Select the test cases to be executed on the selected port. Click **Next**.

   When the selected test cases are executed, the final result and the recommended action is displayed.

If there is a cable fault, the port troubleshooter displays details and the recommended action. For example, the cable must be replaced.

If the port configuration needs to be modified, the port troubleshooter displays details and the recommended action.

Troubleshooting Unicast RPF

Troubleshooting issues for unicast reverse-path forwarding (RPF) on J-EX Series switches include:

1. Legitimate Packets Are Discarded on page 941

Legitimate Packets Are Discarded

Problem The switch filters valid packets from legitimate sources, which results in the switch's discarding packets that should be forwarded.

Solution The interface or interfaces on which legitimate packets are discarded are asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination, so the interface that receives a packet is not the same interface the switch uses to reply to the packet's source.

Unicast RPF works properly only on symmetrically routed interfaces. A symmetrically routed interface is an interface that uses the same route in both directions between the source and the destination. Unicast RPF filters packets by checking the forwarding table for the best return path to the source of an incoming packet. If the best return path uses the same interface as the interface that received the packet, the switch forwards the packet. If the best return path uses a different interface than the interface that received the packet, the switch discards the packet.

NOTE: On J-EX4200 switches, unicast RPF works properly only if all switch interfaces—including aggregated Ethernet interfaces (also referred to as link aggregation groups or LAGs) and routed VLAN interfaces (RVIs)—are symmetrically routed, because unicast RPF is enabled globally on all switch interfaces.

Troubleshooting Uplink Module Installation or Replacement on J-EX4200 Switches

This topic provides troubleshooting information for specific problems related to uplink module ports on J-EX4200 switches.

1. Virtual Chassis port (VCP) connection does not work on page 942

Virtual Chassis port (VCP) connection does not work

Problem The Virtual Chassis port (VCP) connection configured in a J-EX4200 switch does not work.

A port of the uplink module is set as a VCP.

Cause The uplink module installed in the switch was replaced.

Solution Set a port in the uplink module as a VCP. See “Setting an Uplink Module Port as a Virtual Chassis Port (CLI Procedure)” on page 792.

ether-options

Syntax

```
ether-options {
  802.3ad aex {
    lacp {
      force-up;
    }
  }
  auto-negotiation;
  flow-control;
  link-mode mode;
  speed (speed | auto-negotiation);
}
```

Hierarchy Level [edit **interfaces** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure **ether-options** properties for a Gigabit Ethernet interface on the J-EX Series switch.

The remaining statements are explained separately.

Default Enabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

family (for J-EX Series switches)

Syntax

family ccc

```
family ccc;
```

family ethernet-switching

```
family ethernet-switching {
  filter input filter-name;
  filter output filter-name;
  native-vlan-id vlan-id;
  port-mode mode;
  vlan {
    members [ (all | names | vlan-ids) ];
  }
}
```

family inet

```
family inet {
  address address {
    primary;
    vrrp-group group-id {
      advertise-interval milliseconds;
      preempt | no-preempt {
        hold-time seconds;
      }
      priority number;
      virtual-address [addresses];
      virtual-link-local-address ip-address;
    }
  }
  filter input filter-name;
  filter output filter-name;
  primary;
  rpf-check;
  targeted-broadcast;
}
```

family inet6

```
family inet6 {
  address address {
    primary;
    vrrp-inet6-group group-id {
      inet6-advertise-interval milliseconds;
      preempt | no-preempt {
        hold-time seconds;
      }
      priority number;
      virtual-inet6-address [addresses];
      virtual-link-local-address ipv6–address;
    }
  }
```

```
    filter input filter-name;
    filter output filter-name;
    policer input policer-name;
    policer output policer-name;
    rpf-check;
}
```

family iso

```
family iso {
    address interface-address;
}
```

family mpls

```
family mpls;
```

Hierarchy Level

[edit **interfaces** *interface-name* **unit** *logical-unit-number*]

Release Information

Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Configure protocol family information for the logical interface on the switch.

Most standard Junos OS configuration statements are available in Junos OS for J-EX Series switches. This topic lists standard Junos OS statements that you commonly use when configuring protocol families for interfaces on J-EX Series switches as well as statements that are used to configure protocol families only on switch interfaces. For information about additional standard Junos OS statements that you can configure on interfaces, see the *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

Default

Access interfaces on J-EX4200 switches are set to **family ethernet-switching** by default. If you are going to change the family setting for an interface, you might have to delete this default setting or any user-configured family setting before you change the setting to another family type.

J-EX8200 switch interfaces do not have a default family setting.

You must configure a logical interface to be able to use the physical device.

Options See Table 130 on page 959 for protocol families available on the switch interfaces. Different protocol families support different subsets of the interfaces types on the switch.

Interface types on the switch are:

- Aggregated Ethernet (**ae**)
- Gigabit Ethernet (**ge**)
- Interface-range configuration (**interface-range**)
- Loopback (**lo0**)
- Management Ethernet (**me0**)
- Routed VLAN interface (RVI) (**vlan**)
- Virtual management Ethernet (**vme**)
- 10-Gigabit Ethernet (**xe**)

If you are using an interface range, the supported protocol families are the ones supported by the interface types that compose the range.

Not all interface types support all **family** substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

Table 130: Protocol Families and Supported Interface Types

Family	Description	Supported Interface Types						
		ae	ge	lo0	me0	vlan	vme	xe
ccc	Circuit cross-connect protocol family	✓	✓					✓
ethernet-switching	Ethernet switching protocol family	✓	✓		✓			✓
inet	IPv4 protocol family	✓	✓	✓	✓	✓	✓	✓
inet6	IPv6 protocol family	✓	✓	✓	✓	✓	✓	✓
iso	Junos OS protocol family for IS-IS traffic	✓	✓	✓	✓	✓	✓	✓
mpls	MPLS protocol family	✓	✓	✓	✓		✓	✓

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

filter

Syntax filter (input | output) *filter-name*;

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number* **family** ethernet-switching],
[edit **interfaces** *interface-name* **unit** *logical-unit-number* **family** inet],
[edit **interfaces** *interface-name* **unit** *logical-unit-number* **family** inet6]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a firewall filter to traffic entering the port or Layer 3 interface or exiting the Layer 3 interface.

Default All incoming traffic is accepted unmodified on the port or Layer 3 interface, and all outgoing traffic is sent unmodified from the port or Layer 3 interface.

Options ***filter-name***—Name of a firewall filter defined in the **filter** statement.

- **input**—Apply a firewall filter to traffic entering the port or Layer 3 interface.
- **output**—Apply a firewall filter to traffic exiting the Layer 3 interface.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- Firewall Filters for J-EX Series Switches Overview on page 2721
- *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/

flow-control

Syntax (flow-control | no-flow-control);

Hierarchy Level [edit **interfaces** *interface-name* **ether-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Explicitly enable flow control, which regulates the flow of packets from the switch to the remote side of the connection, or disable it.

- **flow-control**—Enable flow control; flow control is useful when the remote device is a Gigabit Ethernet switch.
- **no-flow-control**—Disable flow control.

Default Flow control enabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

force-up

Syntax force-up;

Hierarchy Level [edit **interfaces** *interface-name* **ether-options 802.3ad lacp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the state of the interface as UP when the peer has limited LACP capability.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

interface-range

Syntax

```
interface-range interface-range name {
  ether-options {
    802.3ad aex ;
    auto-negotiation;
    flow-control;
    link-mode mode;
    speed ( speed | auto-negotiation) ;
  }
  hold-time up milliseconds down milliseconds;
  member interface-name;
  member-range starting-interface name to ending-interface name;
  mtu bytes;
}
```

Hierarchy Level [edit interfaces]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Group interfaces that share a common configuration profile.

NOTE: The interface range definition is supported only for Gigabit, 10-Gigabit, and Fast Ethernet interfaces.

Options *interface-range-name*—Name of the interface range.

NOTE: You can use regular expressions and wildcards to specify the interfaces in the member-range configuration. Do not use wildcards for interface types.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

    description text;
    disable;
    family family-name {...}
    (traps | no-traps);
    vlan-id vlan-id-number;
  }
  vlan-tagging;
}
```

interfaces vlan

```
vlan {
  description  text;
  disable;
  hold-time up milliseconds down milliseconds;
  mtu bytes;
  no-gratuitous-arp-request;
  traceoptions;
  (traps | no-traps);
  unit logical-unit-number {
    description text;
    disable;
    family family-name {...}
    proxy-arp (restricted | unrestricted);
    (traps | no-traps);
  }
}
```

interfaces vme

```
vme {
  description text;
  disable;
  hold-time up milliseconds down milliseconds;
  mtu bytes;
  no-gratuitous-arp-request;
  traceoptions;
  (traps | no-traps);
  unit logical-unit-number {
    description text;
    disable;
    family family-name {...}
    (traps | no-traps);
    vlan-id vlan-id-number;
  }
  vlan-tagging;
}
```

interfaces xe

```
xe-fpc/pic/port {
  description text;
  disable;
  ether-options {
    802.3ad aex {
      lacp (802.3ad) {
        force-up;
      }
    }
    (auto-negotiation | no-auto-negotiation);
    (flow-control | no-flow-control);
    link-mode mode;
    speed (auto-negotiation | speed);
  }
  hold-time up milliseconds down milliseconds;
  mtu bytes;

    disable;
    family family-name {...}
    proxy-arp (restricted | unrestricted);
    rpm;
    (traps | no-traps);
    vlan-id vlan-id-number;
  }
  vlan-tagging;
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure interfaces on J-EX Series switches.

Most standard Junos OS configuration statements are available in Junos OS for J-EX Series switches. This topic lists standard Junos OS statements that you commonly use when configuring interfaces on J-EX Series switches as well as statements that are used to configure only switch interfaces; it does not list all of the possible interface configuration statements for each interface.

For information about additional standard Junos OS statements that you can configure on interfaces, see the *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

Options See Table 131 on page 967 for the interface types and protocol-family options supported on the switch. Different protocol families support different subsets of the interface types on the switch. See the **family** statement for syntax of the protocol families supported for switch interfaces.

Not all interface types support all **family** substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

Table 131: Interface Types and Their Supported Protocol Families

Interface Typ	Description	Supported Protocol Families					
		ccc	ethernet-switching	inet	inet6	iso	mpls
ae	Aggregated Ethernet interface (also referred to as a link aggregation group [LAG])	✓	✓	✓	✓	✓	✓
ge	Gigabit Ethernet interface	✓	✓	✓	✓	✓	✓
lo0	Loopback interface			✓	✓	✓	✓
me0	Management Ethernet interface		✓	✓	✓	✓	✓
vlan	Routed VLAN interface (RVI)			✓	✓	✓	
vme	Virtual management Ethernet interface			✓	✓	✓	✓
xe	10-Gigabit Ethernet interface	✓	✓	✓	✓	✓	✓
interface-range	Interface-range configuration	Supported protocol families are the ones supported by the interface types that compose the range.					

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

lacp

Syntax

```
lacp mode {
  periodic interval;
}
```

Hierarchy Level [edit **interfaces** ae*x* **aggregated-ether-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Link Aggregation Control Protocol (LACP).

Default LACP is not enabled.

Options *mode* —LACP mode:

- **active**—Initiate transmission of LACP packets
- **passive**—Respond to LACP packets

The remaining statement is explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

lacp (802.3ad)

Syntax

```
lacp {
  force-up;
}
```

Hierarchy Level [edit **interfaces** *interface-name* **ether-options 802.3ad**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch on page 740

- Understanding Aggregated Ethernet Interfaces and LACP on page 867
- *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/

link-mode

Syntax link-mode *mode*;

Hierarchy Level [edit **interfaces** *interface-name* **ether-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the device's link-connection characteristic.

Default The **automatic** mode is enabled.

Options *mode* —Link characteristic:

- **full-duplex**—Connection is full duplex.
- **half-duplex**—Connection is half duplex.
- **automatic**—Link mode is negotiated.

If **no-auto-negotiation** is specified in ether-options, you can select only **full-duplex** or **half-duplex**. If **auto-negotiation** is specified in **ether-options**, you can select any mode.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Gigabit Ethernet Interfaces (CLI Procedure) on page 919
- Configuring Gigabit Ethernet Interfaces (J-Web Procedure) on page 909
- *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/

link-speed

Syntax link-speed *speed*;

Hierarchy Level [edit interfaces ae*x* **aggregated-ether-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For aggregated Ethernet interfaces only, set the required link speed.

Options ***speed***—For aggregated Ethernet links, specify ***speed*** in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Aggregated Ethernet links on J-EX Series switches can have one of the following speed values:

- **1g**—Links are 1 Gbps.
- **10g**—Links are 10 Gbps.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch on page 740
- Configuring Aggregated Ethernet Interfaces (CLI Procedure) on page 922

member

Syntax member *interface-name*;

Hierarchy Level [edit **interfaces interface-range** *interface-range-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the name of the member interface belonging to an interface range on the J-EX Series switch.

Options ***interface-name***—Name of the interface.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Gigabit Ethernet Interfaces (CLI Procedure) on page 919

members

Syntax members [(all | *names* | *vlan-ids*)];

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number* **family ethernet-switching vlan**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For trunk interfaces, configure the VLANs for which the interface can carry traffic.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options **all**—Specifies that this trunk interface is a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

NOTE: Each VLAN that is configured must have a specified VLAN ID when you attempt to commit the configuration; otherwise, the configuration commit fails. Also, all cannot be the name of a VLAN on the switch.

names—Name of one or more VLANs.

vlan-ids—Numeric identifier of one or more VLANs. For a series of tagged VLANs, specify a range; for example, **10-20** or **10-20 23 27-30**.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

member-range

Syntax member-range *starting-interface-name* to *ending-interface-name*;

Hierarchy Level [edit **interfaces interface-range** *interface-range-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the names of the first and last members of a sequence of interfaces belonging to an interface range.

Options **Range:** *Starting interface-name* to *ending interface-name*—The name of the first member and the name of the last member in the interface sequence.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/

minimum-links

Syntax minimum-links *number*;

Hierarchy Level [edit interfaces ae*x* **aggregated-ether-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For an aggregated Ethernet interface, set the minimum number of links that must be up for the bundle to be labeled up.

Options *number*—Number of links.

Range: 1 through 8 for J-EX Series switches other than J-EX8200 switches
1 through 12 for J-EX8200 switches

Default: 1

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Aggregated Ethernet High-Speed Uplinks Between a Virtual Chassis Access Switch and a Virtual Chassis Distribution Switch on page 740
- Configuring Aggregated Ethernet Interfaces (CLI Procedure) on page 922

mtu

Syntax mtu *bytes*;

Hierarchy Level [edit **interfaces** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum transmission unit (MTU) size for the media. Changing the media MTU size causes an interface to be deleted and added again. Keep the following points in mind if you are configuring MTU size for jumbo frames on these special types of interfaces:

- **For LAG interfaces**—Configuring the jumbo MTU size on a link aggregation group (LAG) interface (**ae***x*) automatically configures the jumbo MTU size on the member links.
- **For RVIs**—Jumbo frames of up to 9216 bytes are supported on the routed VLAN interface (RVI), which is named **vlan**. The RVI functions as a logical router. To route jumbo data packets on the RVI, you must configure the jumbo MTU size on the member physical interfaces of the RVI and not on the RVI itself (the **vlan** interface). However, for jumbo control packets—for example, to ping the RVI with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the interface named **vlan** (the RVI).

CAUTION: Setting or deleting the jumbo MTU size on the RVI (the vlan interface) while the switch is transmitting packets might result in dropped packets.

Default 1514 bytes

Options *bytes*—MTU size.
Range: 256 through 9216 bytes
Default: 1514 bytes

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

native-vlan-id

Syntax native-vlan-id *vlan-id*;

Hierarchy Level [edit **interfaces** *interface-name* unit 0 **family** ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLAN identifier to associate with untagged packets received on the interface.

Options ***vlan-id***—Numeric identifier of the VLAN.
Range: 0 through 4095

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

periodic

Syntax periodic *interval*;

Hierarchy Level [edit **interfaces** ae*x* **aggregated-ether-options lacp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the interval for periodic transmission of LACP packets.

Default **fast**

Options ***interval*** —Interval at which to periodically transmit LACP packets:

- **fast**—Transmit packets every second. This is the default.
- **slow**—Transmit packets every 30 seconds.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

pic

Syntax

```
pic pic-number {
  sfpplus {
    pic-modemode;
      }
    }
```

Hierarchy Level [edit **chassis fpc** *slot*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable the specified port of the SFP+ uplink module to perform in the operating mode specified by **pic-mode**. The port is indicated by a Physical Interface Card (PIC) number.

Options ***pic-number***—Number of the PIC. For uplink ports in J-EX4200 switches, the PIC number is always 1.

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Setting the Mode on an SFP+ Uplink Module (CLI Procedure) on page 921

pic-mode

Syntax pic-mode *mode*;

Hierarchy Level [edit **chassis fpc** *slot* **pic** *pic-number* **sfpplus**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the operating mode for the specified port on the SFP+ uplink module on a J-EX4200 switch.

Options ***mode***—Operating mode of the SFP+ uplink module:

- **1G**—1-gigabit operating mode
- **10G**—10-gigabit operating mode

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Setting the Mode on an SFP+ Uplink Module (CLI Procedure) on page 921

port-mode

Syntax port-mode *mode*;

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number* **family** ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether an interface on the switch operates in access or trunk mode.

Default All switch interfaces are in access mode.

Options

access—Have the interface operate in access mode. In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to network devices such as PCs, printers, IP telephones, and IP cameras.

trunk—Have the interface operate in trunk mode. In this mode, the interface can be in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

rpf-check

Syntax rpf-check;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family inet],
[edit interfaces *interface-name* unit *logical-unit-number* family inet6]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description On J-EX4200 switches, enable a reverse-path forwarding (RPF) check on unicast traffic (except ECMP packets) on *all* ingress interfaces.

On J-EX8200 switches, enable an RPF check on unicast traffic, including ECMP packets, on the selected ingress interface.

Default Unicast RPF is disabled on all interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Unicast RPF on a J-EX Series Switch on page 900
- Configuring Unicast RPF (CLI Procedure) on page 927
- Disabling Unicast RPF (CLI Procedure) on page 928

sfpplus

Syntax

```
sfpplus {
  pic-mode mode;
}
```

Hierarchy Level [edit **chassis fpc** *slot* **pic** *pic-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the operating mode for the specified port on the SFP+ uplink module on the J-EX4200 switch.

The remaining statement is explained separately.

Default By default, the SFP+ uplink module operates in the 10-gigabit mode and supports SFP+ transceivers.

NOTE: The SFP+ uplink module provides two ports for 10-gigabit small form-factor pluggable (SFP+) transceivers when configured to operate in 10-gigabit mode or four ports for 1-gigabit small form-factor pluggable (SFP) transceivers when configured to operate in 1-gigabit mode.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Setting the Mode on an SFP+ Uplink Module (CLI Procedure) on page 921

speed

Syntax speed (auto-negotiation | *speed*) ;

Hierarchy Level [edit **interfaces** *interface-name* **ether-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the interface's speed.

Default If the **auto-negotiation** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level is enabled, the **auto-negotiation** option is enabled by default.

Options

- **auto-negotiation**—Automatically negotiate the speed based on the speed of the other end of the link. This option is available only when the **auto-negotiation** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level is enabled.
- ***speed***—Specify the interface speed. If the **auto-negotiation** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level is disabled, you must specify a specific value. This value sets the speed that is used on the link. If the **auto-negotiation** statement is enabled, you might want to configure a specific speed value to advertise the desired speed to the remote end.
  - **10m**—10 Mbps
  - **100m**—100 Mbps
  - **1g**—1 Gbps

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

targeted-broadcast

Syntax targeted-broadcast;

Hierarchy Level [edit **interfaces**ge-*chassis/slot/port* **unit** *logical-unit-number* **family inet**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable IP directed broadcast on a specified subnet.

Default IP directed broadcast is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring IP Directed Broadcast on a J-EX Series Switch on page 904
- Configuring IP Directed Broadcast (CLI Procedure) on page 929

unit

Syntax

```
unit logical-unit-number {
  description text;
  disable;
  family family-name {...}
  proxy-arp (restricted | unrestricted);
  rpm;
  (traps | no-traps);
  vlan-id vlan-id-number;
}
```

Hierarchy Level [edit **interfaces** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

Options ***logical-unit-number***—Number of the logical unit.

Range: 0 through 16,384

The remaining statements are explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

vlan

Syntax

```
vlan {
  members [ (all | names | vlan-ids) ];
}
```

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number* **family** ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Bind an 802.1Q VLAN tag ID to a logical interface.

The remaining statement is explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

vlan-id

Syntax vlan-id *vlan-id-number*;

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Bind an 802.1Q VLAN tag ID to a logical interface.

NOTE: The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.

Options ***vlan-id-number***—A valid VLAN identifier.
Range: 1 through 4094

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

vlan-tagging

Syntax vlan-tagging;

Hierarchy Level [edit **interfaces** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable VLAN tagging. The switch will receive and forward single-tag frames with 802.1Q VLAN tags.

Default VLAN tagging is disabled by default.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

CHAPTER 56

Operational Mode Commands for Interfaces

clear ipv6 neighbors

Syntax
clear ipv6 neighbors
<all | host *hostname*>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Clear IPv6 neighbor cache information.

Options
none—Clear all IPv6 neighbor cache information.

all—(Optional) Clear all IPv6 neighbor cache information.

host *hostname*—(Optional) Clear the information for the specified IPv6 neighbors.

Required Privilege Level
view

Related Documentation
- **show ipv6 neighbors on page 1031**

List of Sample Output
clear ipv6 neighbors on page 990

Output Fields
When you enter this command, you are provided feedback on the status of your request.

clear ipv6 neighbors
```
user@host> clear ipv6 neighbors
```

monitor interface

Syntax monitor interface
<*interface-name* | traffic <detail>>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as loopbacks detected and increases in framing errors.

Options none—Display real-time statistics for all interfaces.

interface-name—(Optional) Display real-time statistics for the specified interface.

traffic—(Optional) Display traffic data for all active interfaces.

detail—(Optional) With traffic option only, display detailed output.

Additional Information The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the c key. For a description of the statistical information provided in the output of this command, see the **show interfaces extensive** command for a particular interface type in the *Junos OS Interfaces Command Reference*. To control the output of the **monitor interface *interface-name*** command while it is running, use the keys listed in Table 132 on page 991. The keys are not case-sensitive.

Table 132: Output Control Keys for the monitor interface interface-name Command

Key	Action
c	Clears (returns to zero) the delta counters since **monitor interface** was started. This does not clear the accumulative counter. To clear the accumulative counter, use the **clear interfaces interval** command.
f	Freezes the display, halting the display of updated statistics and delta counters.
i	Displays information about a different interface. The command prompts you for the name of a specific interface.
n	Displays information about the next interface. The **monitor interface** command displays the physical or logical interfaces in the same order as the **show interfaces terse** command.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws the display, resuming the update of the statistics and delta counters.

To control the output of the **monitor interface traffic** command while it is running, use the keys listed in Table 133 on page 992. The keys are not case-sensitive.

Table 133: Output Control Keys for the monitor interface traffic Command

Key	Action
b	Displays the statistics in units of bytes and bytes per second (bps).
c	Clears (return to 0) the delta counters in the **Current Delta** column. The statistics counters are not cleared.
d	Displays the **Current Delta** column (instead of the rate column) in bps or packets per second (pps).
p	Displays the statistics in units of packets and packets per second (pps).
q or Esc	Quits the command and returns to the command prompt.
r	Displays the rate column (instead of the **Current Delta** column) in bps and pps.

Required Privilege Level trace

List of Sample Output

monitor interface (Physical) on page 993
monitor interface (OTN Interface) on page 994
monitor interface (Logical) on page 995
monitor interface traffic on page 995
monitor interface traffic detail on page 996

Output Fields Table 134 on page 992 describes the output fields for the **monitor interface** command. Output fields are listed in the approximate order in which they appear.

Table 134: monitor interface Output Fields

Field Name	Field Description	Level of Output
router1	Hostname of the router.	All levels
Seconds	How long the monitor interface command has been running or how long since you last cleared the counters.	All levels
Time	Current time (UTC).	All levels
Delay *x/y/z*	Time difference between when the statistics were displayed and the actual clock time. • *x*—Time taken for the last polling (in milliseconds). • *y*—Minimum time taken across all pollings (in milliseconds). • *z*—Maximum time taken across all pollings (in milliseconds).	All levels
Interface	Short description of the interface, including its name, status, and encapsulation.	All levels
Link	State of the link: **Up**, **Down**, or **Test**.	All levels

Table 134: monitor interface Output Fields *(continued)*

Field Name	Field Description	Level of Output
Current delta	Cumulative number for the counter in question since the time shown in the Seconds field, which is the time since you started the command or last cleared the counters.	All levels
Statistics	For an explanation of the interface statistics, see the description of the **show interfaces extensive** command for a particular interface type in the *Junos OS Interfaces Command Reference*.	All levels
Description	With the **traffic** option, displays the interface description configured at the **[edit interfaces *interface-name*]** hierarchy level.	**detail**

show ethernet-switching interfaces

Syntax show ethernet-switching interfaces
<brief | detail | summary>
<interface *interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about switched Ethernet interfaces.

Options none—(Optional) Display brief information for Ethernet switching interfaces.

brief | detail | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display Ethernet switching information for a specific interface.

Required Privilege Level view

Output Fields Table 135 on page 997 lists the output fields for the **show ethernet-switching interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 135: show ethernet-switching interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a switching interface.	All levels
State	Interface state. Values are **up** and **down**.	none, **brief**, **detail**, **summary**
VLAN members	Name of a VLAN.	none, **brief**, **detail**, **summary**
Tag	Number of the 802.1Q-tag.	All levels

Table 135: show ethernet-switching interfaces Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tagging	Specifies whether the interface forwards 802.1Q-tagged or untagged traffic.	All levels
Blocking	The forwarding state of the interface: • **unblocked**—Traffic is forwarded on the interface. • **blocked**—Traffic is not being forwarded on the interface. • **Disabled by bpdu control**—The interface is disabled due to receiving BPDUs on a protected interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. • **blocked by RTG**—The specified redundant trunk group is disabled. • **blocked by STP**—The interface is disabled due to a spanning tree protocol error. • **MAC limit exceeded**—The interface is temporarily disabled due to a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **MAC move limit exceeded**—The interface is temporarily disabled due to a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **Storm control in effect**—The interface is temporarily disabled due to a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.	none, **brief**, **detail**, **summary**
Index	The VLAN index internal to the Junos OS.	**detail**
mapping	The C-VLAN to S-VLAN mapping information: • **dot1q-tunneled**—The interface maps all traffic to the S-VLAN (all-in-one bundling). • **native**—The interface maps untagged and priority tagged packets to the S-VLAN. • **push**—The interface maps packets to a firewall filter to an S-VLAN. • **policy-mapped**—The interface maps packets to a specifically defined S-VLAN. • *integer*—The interface maps packets to the specified S-VLAN.	**detail**

show interfaces diagnostics optics

Syntax show interfaces diagnostics optics *interface-name*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display diagnostics data and alarms for Gigabit Ethernet optical transceivers (SFP or SFP+) installed in J-EX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.

Options *interface-name*—Name of the interface associated with the port in which the transceiver is installed: **ge-*fpc/pic/port*** or **xe-*fpc/pic/port***.

Required Privilege Level view

show interfaces diagnostics optics xe-0/1/0 (SFP+ Transceiver) on page 1003

Output Fields Table 136 on page 1000 lists the output fields for the **show interfaces diagnostics optics** command. Output fields are listed in the approximate order in which they appear.

Table 136: show interfaces diagnostics optics Output Fields

Field Name	Field Description
Physical interface	Displays the name of the physical interface.
Laser bias current	Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Module temperature	Displays the temperature, in Celsius and Fahrenheit.
Module voltage	Displays the voltage, in Volts.

Table 136: show interfaces diagnostics optics Output Fields *(continued)*

Field Name	Field Description
Receiver signal average optical power	Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Laser bias current high alarm	Displays whether the laser bias power setting high alarm is **On** or **Off**.
Laser bias current low alarm	Displays whether the laser bias power setting low alarm is **On** or **Off**.
Laser bias current high warning	Displays whether the laser bias power setting high warning is **On** or **Off**.
Laser bias current low warning	Displays whether the laser bias power setting low warning is **On** or **Off**.
Laser output power high alarm	Displays whether the laser output power high alarm is **On** or **Off**.
Laser output power low alarm	Displays whether the laser output power low alarm is **On** or **Off**.
Laser output power high warning	Displays whether the laser output power high warning is **On** or **Off**.
Laser output power low warning	Displays whether the laser output power low warning is **On** or **Off**.
Module temperature high alarm	Displays whether the module temperature high alarm is **On** or **Off**.
Module temperature low alarm	Displays whether the module temperature low alarm is **On** or **Off**.
Module temperature high warning	Displays whether the module temperature high warning is **On** or **Off**.
Module temperature low warning	Displays whether the module temperature low warning is **On** or **Off**.
Module voltage high alarm	Displays whether the module voltage high alarm is **On** or **Off**.
Module voltage low alarm	Displays whether the module voltage low alarm is **On** or **Off**.
Module voltage high warning	Displays whether the module voltage high warning is **On** or **Off**.
Module voltage low warning	Displays whether the module voltage low warning is **On** or **Off**.
Laser rx power high alarm	Displays whether the receive laser power high alarm is **On** or **Off**.
Laser rx power low alarm	Displays whether the receive laser power low alarm is **On** or **Off**.
Laser rx power high warning	Displays whether the receive laser power high warning is **On** or **Off**.
Laser rx power low warning	Displays whether the receive laser power low warning is **On** or **Off**.
Laser bias current high alarm threshold	Displays the vendor-specified threshold for the laser bias current high alarm.
Laser bias current low alarm threshold	Displays the vendor-specified threshold for the laser bias current low alarm.

Table 136: show interfaces diagnostics optics Output Fields *(continued)*

Field Name	Field Description
Laser bias current high warning threshold	Displays the vendor-specified threshold for the laser bias current high warning.
Laser bias current low warning threshold	Displays the vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Displays the vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Displays the vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Displays the vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Displays the vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Displays the vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Displays the vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Displays the vendor-specified threshold for the module temperature high warning.
Module temperature low warning threshold	Displays the vendor-specified threshold for the module temperature low warning.
Module voltage high alarm threshold	Displays the vendor-specified threshold for the module voltage high alarm.
Module voltage low alarm threshold	Displays the vendor-specified threshold for the module voltage low alarm.
Module voltage high warning threshold	Displays the vendor-specified threshold for the module voltage high warning.
Module voltage low warning threshold	Displays the vendor-specified threshold for the module voltage low warning.
Laser rx power high alarm threshold	Displays the vendor-specified threshold for the laser rx power high alarm.
Laser rx power low alarm threshold	Displays the vendor-specified threshold for the laser rx power low alarm.
Laser rx power high warning threshold	Displays the vendor-specified threshold for the laser rx power high warning.
Laser rx power low warning threshold	Displays the vendor-specified threshold for the laser rx power low warning.

show interfaces ge-

Syntax

show interfaces ge-*fpc/pic/port*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display status information about the specified Gigabit Ethernet interface.

Options

ge-*fpc/pic/port*—Display standard information about the specified Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index* —(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

Output Fields

Table 137 on page 1005 lists the output fields for the **show interfaces ge-** command. Output fields are listed in the approximate order in which they appear.

Table 137: show interfaces ge- Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels

Table 137: show interfaces ge- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Enabled	State of the interface: **Enabled** or **Disabled**.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Dell Support only (see "Requesting Technical Support" on page lxxi).	**detail extensive**
Description	Optional user-specified description.	**brief detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface. Default is 1514.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	Autonegotiation status: **Enabled** or **Disabled**.	All levels
Remote-fault	Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the link.	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	MAC address of the hardware.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2008–01–16 10:52:40 UTC (3d 22:58 ago).**	**detail extensive** none

Table 137: show interfaces ge- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface • **Output packets**—Number of packets transmitted on the interface. NOTE: The bandwidth bps counter is not enabled on the switch.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 sanity checks of the headers. For example, a frame with less than 20 bytes of available IP header is discarded. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 137: show interfaces ge- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface.	**detail extensive**
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch or turn on the red or yellow alarm LED on the front of the switch. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none

Table 137: show interfaces ge- Output Fields *(continued)*

Field Name	Field Description	Level of Output
MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem. • **Total octets** and **total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets. • **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **MAC control frames**—Number of MAC control frames. • **MAC pause frames**—Number of MAC control frames with **pause** operational code. • **Oversized frames**—Number of frames that exceed 1518 octets. • **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”	**extensive**
Filter Statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem.	**extensive**

Table 137: show interfaces ge- Output Fields *(continued)*

Field Name	Field Description	Level of Output

Autonegotiation information	Information about link autonegotiation:
	• **Negotiation status:**
	  • **Incomplete**—Ethernet interface has the speed or link mode configured.
	  • **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured or does not perform autonegotiation.
	  • **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner:**
	  • **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
	  • **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports **PAUSE** on both receive and transmit or **PAUSE** only on receive).
	  • **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	  • **Link partner speed**—Speed of the link partner.
	• **Local resolution**—Information from the link partner:
	  • **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports **PAUSE** on both receive and transmit or **PAUSE** only on receive).
	  • **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. NOTE: For a J-EX4200 standalone switch, the FPC slot number refers to the switch itself and is always **0**. In a Virtual Chassis configuration, the FPC slot number refers to the member ID. In a J-EX8200 switch, the FPC slot number refers to the line card slot number.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none

Table 137: show interfaces ge- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Generation	Unique number for use by Dell Support only (see "Requesting Technical Support" on page lxxi).	**detail extensive**
Flags	Information about the logical interface.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface.	**detail extensive**
IPv6 transit statistics	If IPv6 statistics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface.	**extensive**
Local statistics	Number and rate of bytes and packets destined to and from the switch.	**extensive**
Transit statistics	Number and rate of bytes and packets transiting the switch.	**extensive**
Generation	Unique number for use by Dell Support only (see "Requesting Technical Support" on page lxxi).	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table **inet.0**.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface.	**detail extensive**
Output Filters	Names of any output filters applied to this interface.	**detail extensive**
Flags	Information about protocol family flags. If unicast reverse-path forwarding (RPF) is explicitly configured on the specified interface, the uRPF flag is displayed. If unicast RPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag is not displayed even though unicast RPF is enabled.	**detail extensive**
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about the address flags.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none

Table 137: show interfaces ge- Output Fields *(continued)*

show interfaces queue

Syntax

show interfaces queue
<both-ingress-egress>
<egress>
<forwarding-class *forwarding-class*>
<ingress>
<interface-name *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display class-of-service (CoS) queue information for physical interfaces.

Options

none—Show detailed CoS queue statistics for all physical interfaces.

both-ingress-egress—(Optional) Show both ingress and egress queue statistics. (Ingress statistics are not available for all interfaces.)

egress—(Optional) Show eqress queue statistics only.

forwarding-class *forwarding-class*—(Optional) Show queue statistics only for the specified forwarding class.

ingress—(Optional) Show ingress queue statistics only. (Ingress statistics are not available for all interfaces.)

interface-name *interface-name*—(Optional) Show queue statistics for the specified interface.

Required Privilege Level

List of Sample Output

show interfaces queue ge-0/0/0 on page 1018

Output Fields

Table 138 on page 1016 lists the output fields for the **show interfaces queue** command. Output fields are listed in the approximate order in which they appear.

Table 138: show interfaces queue Output Fields

Field Name	Field Description
Physical Interface and Forwarding Class Information	
Physical interface	Name of the physical interface.

Table 138: show interfaces queue Output Fields *(continued)*

Field Name	Field Description
Enabled	State of the interface. Possible values are: • **Administratively down, Physical link is Down**—The interface is turned off, and the physical link is inoperable. • **Administratively down, Physical link is Up**—The interface is turned off, but the physical link is operational and can pass packets when it is enabled. • **Enabled, Physical link is Down**—The interface is turned on, but the physical link is inoperable and cannot pass packets. • **Enabled, Physical link is Up**—The interface is turned on, and the physical link is operational and can pass packets.
Interface index	Index number of the physical interface, which reflects its initialization sequence.
SNMP ifIndex	SNMP index number for the physical interface.
Description	User-configured interface description.
Forwarding classes	Number of forwarding classes supported and in use for the interface.
Ingress Queues Information (not shown for all interfaces)	
Ingress queues	Number of input queues supported and in use on the specified interface.
Transmitted	Transmission statistics for the queue: • **Packets**—Number of packets transmitted by this queue. • **Bytes**—Number of bytes transmitted by this queue. • **Tail-dropped packets**—Number of packets dropped because the queue buffers were full.
PFE chassis queues	For an interface on an oversubscribed line card, the number of Packet Forwarding Engine chassis queues supported and in use for the port group to which the interface belongs. The Packet Forwarding Engine chassis queue for a port group handles high priority traffic from all the interfaces in the port group.
Egress Queues Information	
Egress queues	Number of output queues supported and in use on the specified interface.
Queue	CoS queue number.
Queued	This counter is not supported on J-EX Series switches.

Table 138: show interfaces queue Output Fields *(continued)*

Field Name	Field Description

Transmitted	Number of packets and bytes transmitted by this queue. Information on transmitted packets and bytes can include:
	• **Packets**—Number of packets transmitted.
	• **Bytes**—Number of bytes transmitted.
	• **Tail-dropped packets**—Number of arriving packets dropped because output queue buffers were full.
	• **RED-dropped packets**—Number of packets dropped because of random early detection (RED).
	  ◦ **Low**—Number of low loss priority packets dropped because of RED.
	  ◦ **High**—Number of high loss priority packets dropped because of RED.
	• **RED-dropped bytes**—Number of bytes dropped because of random early detection (RED).
	  ◦ **Low**—Number of low loss priority bytes dropped because of RED.
	  ◦ **High**—Number of high loss priority bytes dropped because of RED.

Packet Forwarding Engine Chassis Queues	For an interface on an oversubscribed line card, the number of Packet Forwarding Engine chassis queues supported and in use for the port group to which the interface belongs. The queue statistics reflect the traffic flowing on all the interfaces in the port group.

show interfaces queue ge-0/0/0

```
user@switch> show interfaces queue ge-0/0/0
Physical interface: ge-0/0/0, Enabled, Physical link is Down
  Interface index: 130, SNMP ifIndex: 501
Forwarding classes: 16 supported, 4 in use
Egress queues: 8 supported, 4 in use
Queue: 0, Forwarding classes: best-effort
  Queued:
  Transmitted:
    Packets              :                    0
    Bytes                :                    0
    Tail-dropped packets :                    0
Queue: 1, Forwarding classes: assured-forwarding
  Queued:
  Transmitted:
    Packets              :                    0
    Bytes                :                    0
    Tail-dropped packets :                    0
Queue: 5, Forwarding classes: expedited-forwarding
  Queued:
  Transmitted:
    Packets              :                    0
    Bytes                :                    0
    Tail-dropped packets :                    0
Queue: 7, Forwarding classes: network-control
  Queued:
  Transmitted:
    Packets              :                    0
    Bytes                :                    0
    Tail-dropped packets :                    0
```

show interfaces xe-

Syntax

show interfaces xe-*fpc/pic/port*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Display status information about the specified 10-Gigabit Ethernet interface.

Options

xe-*fpc/pic/port* —Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index* —(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Output Fields

Table 139 on page 1020 lists the output fields for the **show interfaces xe-** command. Output fields are listed in the approximate order in which they appear.

Table 139: show interfaces xe- Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Dell Support only (see "Requesting Technical Support" on page lxxi).	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Duplex	Duplicity of the interface.	All levels
BPDU Error	blah blah	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the link.	All levels
Wavelength	Configured wavelength, in nanometers (nm).	All levels
Frequency	Frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none
Schedulers	Number of CoS schedulers configured.	**extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none

Table 139: show interfaces xe- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Hardware address	Hardware MAC address.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped: *year-month-day hour::minute*:*second*: *timezone* (*day*d *hour:minute*:*second* ago)**. For example, **Last flapped: 2008–01–16 10:52:40 UTC (3d 22:58 ago).**	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface • **Output packets**—Number of packets transmitted on the interface. NOTE: The bandwidth bps counter is not enabled on the switch.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 139: show interfaces xe- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Ingress queues	Total number of ingress queues supported on the specified interface.	**extensive**
Queue counters (Ingress)	Statistics for the CoS low and high priority ingress queues: • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface.	**detail extensive**
Queue counters (Egress)	Statistics for the CoS egress queues: • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
PFE Egress queues	Total number of Packet Forwarding Engine egress queues shared by the interfaces in a port group. Displayed for an interface on a 40–port SFP+ line card.	**detail extensive**

Table 139: show interfaces xe- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Queue counters (Packet Forwarding Engine Egress)	Statistics for the Packet Forwarding Engine egress queues: • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism. Displayed for an interface on a 40–port SFP+ line card.	**detail extensive**
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch or turn on the red or yellow alarm LED on the front of the switch. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
PCS statistics	Physical Coding Sublayer (PCS) fault conditions from the LAN PHY device.	**detail extensive**
MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem. • **Total octets** and **total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets. • **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **MAC control frames**—Number of MAC control frames. • **MAC pause frames**—Number of MAC control frames with **pause** operational code. • **Oversized frames**—Number of frames that exceed 1518 octets. • **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”	**extensive**

Table 139: show interfaces xe- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem.	**extensive**

Autonegotiation information	Information about link autonegotiation:
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner:**
	  ◦ **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports **PAUSE** on both receive and transmit or **PAUSE** only on receive).
	  ◦ **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	• **Local resolution**—Information from the link partner:
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports **PAUSE** on both receive and transmit or **PAUSE** only on receive).
	  ◦ **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. NOTE: For a J-EX4200 standalone switch, the FPC slot number refers to the switch itself and is always **0**. In a Virtual Chassis configuration, FPC slot number refers to the member ID. In a J-EX8200 switch, the FPC slot number refers to the line card slot number.	**extensive**

Table 139: show interfaces xe- Output Fields *(continued)*

Field Name	Field Description	Level of Output

CoS Information	Information about the CoS queue for the physical interface:
	• **Direction**—Queue direction, either **Input** or **Output**.
	• **CoS transmit queue**—Queue number and its associated user-configured forwarding class name.
	• **Bandwidth**—Information about bandwidth allocated to the queue:
	  • **%**—Bandwidth allocated to the queue as a percentage
	  • **bps**—Bandwidth allocated to the queue in bps
	• **Buffer**—Information about buffer space allocated to the queue:
	  • **%**—Buffer space allocated to the queue as a percentage.
	  • **usec**—Buffer space allocated to the queue in microseconds. This value is nonzero only if the buffer size is configured in terms of time.
	• **Priority**—Queue priority: **low** or **high**.
	• **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	

Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Dell technical support only.	**detail extensive**
Flags	Information about the logical interface.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface.	**detail extensive**
IPv6 transit statistics	If IPv6 statistics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface.	**extensive**
Local statistics	Number and rate of bytes and packets destined to and from the switch.	**extensive**
Transit statistics	Number and rate of bytes and packets transiting the switch.	**extensive**
Generation	Unique number for use by Dell Support only (see "Requesting Technical Support" on page lxxi).	**detail extensive**

Table 139: show interfaces xe- Output Fields *(continued)*

Field Name	Field Description	Level of Output
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table **inet.0**.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface.	**detail extensive**
Output Filters	Names of any output filters applied to this interface.	**detail extensive**
Flags	Information about protocol family flags. If unicast reverse-path forwarding (RPF) is explicitly configured on the specified interface, the uRPF flag is display. If unicast RPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag is not displayed even though unicast RPF is enabled.	**detail extensive**
Addresses, Flags	Information about the address flags.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about the address flags.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none
Generation	Unique number for use by Dell Support only (see "Requesting Technical Support" on page lxxi).	**detail extensive**

Output Fields Table 140 on page 1031 describes the output fields for the **show ipv6 neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 140: show ipv6 neighbors Output Fields

Field Name	Field Description
IPv6 Address	Name of the IPv6 interface.
Linklayer Address	Link-layer address.
State	State of the link: **up**, **down**, **incomplete**, **reachable**, **stale**, or **unreachable**.
Exp	Number of seconds until the entry expires.
Rtr	Whether the neighbor is a routing device: **yes** or **no**.
Secure	Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: **yes** or **no**.
Interface	Name of the interface.

show lacp interfaces

Syntax show lacp interfaces *interface-name*

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet or Gigabit Ethernet interface.

Options none—Display LACP information for all interfaces.

interface-name—(Optional) Display LACP information for the specified interface:

- Aggregated Ethernet—**ae*x***
- Gigabit Ethernet—**ge-*fpc/pic/port***

Required Privilege Level view

List of Sample Output **show lacp interfaces (Aggregated Ethernet) on page 1036**

Output Fields Table 141 on page 1033 lists the output fields for the **show lacp interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 141: show lacp interfaces Output Fields

Field Name	Field Description
Aggregated interface	Aggregated Ethernet interface value.

Table 141: show lacp interfaces Output Fields *(continued)*

Field Name	Field Description

LACP State	LACP state information for each aggregated Ethernet interface:
	• For a child interface configured with force-up, LACP state displays FUP along with the interface name.
	• **Role**—Role played by the interface. It can be one of the following:
	  ◦ **Actor**—Local device participating in LACP negotiation.
	  ◦ **Partner**—Remote device participating in LACP negotiation.
	• **Exp**—Expired state. **Yes** indicates the actor or partner is in an expired state. **No** indicates the actor or partner is not in an expired state.
	• **Def**—Default. **Yes** indicates that the actor's receive machine is using the default operational partner information, administratively configured for the partner. **No** indicates the operational partner information in use has been received in an LACP PDU.
	• **Dist**—Distribution of outgoing frames. **No** indicates distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is **Yes**.
	• **Col**—Collection of incoming frames. **Yes** indicates collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is **No**.
	• **Syn**—Synchronization. If the value is **Yes**, the link is considered synchronized. It has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is **No**, the link is not synchronized. It is currently not in the right aggregation.
	• **Aggr**—Ability of aggregation port to aggregate (**Yes**) or to operate only as an individual link (**No**).
	• **Timeout**—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or fast transmission rate, depending upon the expressed LACP timeout preference (**Long Timeout** or **Short Timeout**).
	• **Activity**—Actor or partner's port activity. **Passive** indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is **Active**. **Active** indicates the port's preference to participate in the protocol regardless of the partner's control value.

Table 141: show lacp interfaces Output Fields *(continued)*

Field Name	Field Description

LACP Protocol	LACP protocol information for each aggregated interface:
	• Link state (active or standby) indicated in parentheses next to the interface when link protection is configured.
	• **Receive State**—One of the following values:
	  • **Current**—The state machine receives an LACP PDU and enters the **Current** state.
	  • **Defaulted**—If no LACP PDU is received before the timer for the **Current** state expires a second time, the state machine enters the **Defaulted** state.
	  • **Expired**—If no LACP PDU is received before the timer for the **Current** state expires once, the state machine enters the **Expired** state.
	  • **Initialize**—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the **Initialize** state.
	  • **LACP Disabled**—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to **LACP Disabled**. This state is similar to the **Defaulted** state, except that the port is forced to operate as an individual port.
	  • **Port Disabled**—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the **Port Disabled** state.
	• **Transmit State**—Transmit state of state machine. One of the following values:
	  • **Fast Periodic**—Periodic transmissions are enabled at a fast transmission rate.
	  • **No Periodic**—Periodic transmissions are disabled.
	  • **Periodic Timer**—Transitory state entered when the periodic timer expires.
	  • **Slow Periodic**—Periodic transmissions are enabled at a slow transmission rate.
	• **Mux State**—State of the multiplexer state machine for the aggregation port. The state is one of the following values:
	  • **Attached**—Multiplexer state machine initiates the process of attaching the port to the selected aggregator.
	  • **Collecting**—**Yes** indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. **No** indicates the receive function of this link is not enabled.
	  • **Collecting Distributing**—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution.
	  • **Detached**—Process of detaching the port from the aggregator is in progress.
	  • **Distributing**—**Yes** indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames may be passed down from the aggregator's distribution function for transmission. **No** indicates the transmit function of this link is not enabled.
	  • **Waiting**—Multiplexer state machine is in a holding process, awaiting an outcome.

LACP Statistics	LACP statistics are returned when the **extensive** option is used and provides the following information: • **LACP Rx**—LACP received counter that increments for each normal hello. • **LACP Tx**—Number of LACP transmit packet errors logged. • **Unknown Rx**—Number of unrecognized packet errors logged. • **Illegal Rx**—Number of invalid packets received.

PART 13

Layer 2 Bridging and VLANs

CHAPTER 57

Bridging and VLANs—Overview

Understanding Bridging and VLANs on J-EX Series Switches

Network switches use Layer 2 bridging protocols to discover the topology of their LAN and to forward traffic toward destinations on the LAN.

This topic explains the following concepts regarding bridging and VLANs on J-EX Series Switches:

Ethernet LANs, Transparent Bridging, and VLANs

Ethernet is a data link layer technology, as defined by Layer 2 of the Open Systems Interconnection (OSI) model of communications protocols. Ethernet was first

standardized by the IEEE in 1982, in IEEE 802.3. Ethernet is used to create LANs. The network devices, called *nodes*, on the LAN transmit data in bundles that are generally called frames or packets.

Each node on a LAN has a unique identifier so that it can be unambiguously located on the network. Ethernet uses the Layer 2 media access control (MAC) address for this purpose. MAC addresses are hardware addresses that are programmed ("burned") into the Ethernet processor in the node.

A characteristic of Ethernet is that nodes on a LAN can transmit data frames at any time. However, the physical connecting cable between the nodes—either coaxial, copper-based (Category 5), or optical cable—can carry only a single stream of data at a time. One result of this design is that when two nodes transmit at the same time, their frames can collide on the cable and generate an error. Ethernet uses a protocol called carrier-sense multiple access with collision detection (CSMA/CD) to detect frame collisions. If a node receives a collision error message, it stops transmitting immediately and waits for a period of time before trying to send the frame again. If the node continues to detect collisions, it progressively increases the time between retransmissions in an attempt to find a time when no other data is being transmitted on the LAN. The node uses a backoff algorithm to calculate the increasing retransmission time intervals.

Ethernet LANs were originally implemented for small, simple networks that carried primarily text. Over time, LANs have become larger and more complex; the type of data they carry has grown to include voice, graphics, and video; and the increased speed of Ethernet interfaces on LANs has resulted in exponential increases in traffic on the network.

The IEEE 802.1D-2004 standard addresses some of the problems caused by the increase in LAN and complexity. This standard defines *transparent bridging* (generally called simply bridging). Bridging divides a single physical LAN (a single *broadcast domain*) into two or more virtual LANs, or VLANs. Each *VLAN* is a collection of network nodes that are grouped together to form separate broadcast domains. On an Ethernet network that is a single LAN, all traffic is forwarded to all nodes on the LAN. On VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN. Frames that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within a VLAN and on the LAN as a whole.

On an Ethernet LAN, all network nodes must be physically connected to the same network. On VLANs, the physical location of the nodes is not important, so you can group network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or even physical location. Each VLAN is identified by a single IP subnetwork and by standardized IEEE 802.1Q encapsulation (discussed below).

How Bridging Works

The transparent bridging protocol allows a switch to learn information about all the nodes on the LAN, including nodes on all the different VLANs. The switch uses this information to create address-lookup tables, called *Ethernet switching tables* that it consults when forwarding traffic to or toward a destination on the LAN.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding
- Filtering
- Aging

The first bridging mechanism is *learning*. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. The switch goes through a learning process to obtain the MAC addresses of all the nodes on the network. It stores these in the Ethernet switching table. To learn MAC addresses, the switch reads all packets that it detects on the LAN or on the local VLAN, looking for MAC addresses of sending nodes. It places these addresses into its Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received and the time when the address was learned.

The second bridging mechanism is *forwarding*. Switches forward traffic, passing it from an incoming interface to an outgoing interface that leads to or toward the destination. To forward frames, the switch consults the Ethernet switching table to see whether the table contains the MAC address corresponding to the frames' destination. If the Ethernet switching table contains an entry for the desired destination address, the switch sends the traffic out the interface associated with the MAC address. The switch also consults the Ethernet switching table in the same way when transmitting frames that originate on devices connected directly to the switch. If the Ethernet switching table does not contain an entry for the desired destination address, the switch uses flooding, which is the third bridging mechanism.

Flooding is how the switch learns about destinations not in its Ethernet switching table. If this table has no entry for a particular destination MAC address, the switch floods the traffic out all interfaces except the interface on which it was received. (If traffic originates on the switch, the switch floods it out all interfaces.) When the destination node receives the flooded traffic, it sends an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and to add the address to its Ethernet switching table.

Filtering, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—of which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

Finally, the switch uses *aging*, the fifth bridging mechanism, to keep the entries in the Ethernet switching table current. For each MAC address in the Ethernet switching table, the switch records a timestamp of when the information about the network node was learned. Each time the switch detects traffic from a MAC address, it updates the

timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node's MAC address from the Ethernet switching table. This aging process ensures that the switch tracks only active nodes on the network and that it is able to flush out network nodes that are no longer available.

Types of Switch Ports

The ports, or interfaces, on a switch operate in either access mode or trunk mode.

An interface in access mode connects to a network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The interface itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, when you boot a switch and use the factory-default configuration, or when you boot the switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode.

Trunk interfaces handle traffic for multiple VLANs, multiplexing the traffic for all those VLANs over the same physical connection. Trunk interfaces are generally used to interconnect switches to one another.

IEEE 802.1Q Encapsulation and Tags

To identify which VLAN traffic belongs to, all frames on an Ethernet VLAN are identified by a tag, as defined in the IEEE 802.1Q standard. These frames are *tagged* and are encapsulated with 802.1Q tags.

For a simple network that has only a single VLAN, all traffic has the same 802.1Q tag.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames know which VLAN the frames belong to. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine to origin of frames and where to forward them.

VLANs 0 and 4095 are reserved by the Junos OS, so you cannot use them in your network.

Assignment of Traffic to VLANs

You assign traffic to a particular VLAN in one of the following ways:

- By interface (port) on the switch. You specify that all traffic received on a particular interface on the switch is assigned to a specific VLAN. If you use the default factory switch settings, all traffic received on an access interface is untagged. This traffic is part of a default VLAN, but it is not tagged with an 802.1Q tag. When configuring the switch, you specify which VLAN to assign the traffic to. You configure the VLAN either by using a VLAN number (called a VLAN ID) or by using a name, which the switch translates into a numeric VLAN ID.
- By MAC address. You can specify that all traffic received from a specific MAC address be forwarded to a specific egress interface (next hop) on the switch. This method is administratively cumbersome to configure manually, but it can be useful when you are using automated databases to manage the switches on your network.

NOTE: If a J-EX4200 Ethernet Switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the *slot* element of the interface name.

The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

Ethernet Switching Tables

As J-EX Series switches learn the MAC addresses of the devices on local VLANs, they store them in the bridge on the switch. With each MAC address, the Ethernet switching table stores and associates the name of the interface (or port) on which the switch learned that address. The switch uses the information in this table when forwarding packets toward their destination.

Layer 2 and Layer 3 Forwarding of VLAN Traffic

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q, Spanning Tree Protocol (STP), and GARP VLAN Registration Protocol (GVRP).

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. On J-EX Series switches, the same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

GVRP and MVRP

The GARP VLAN Registration Protocol (GVRP) and Multiple VLAN Registration Protocol (MVRP) are used to manage dynamic VLAN registration in a LAN.

GVRP is an application protocol of the Generic Attribute Registration Protocol (GARP) and is defined in the IEEE 802.1Q standard. GVRP learns VLANs on a particular 802.1Q trunk interface and adds the corresponding trunk interface to the VLAN if the advertised VLAN is preconfigured on the switch.

MVRP is an application protocol of the Multiple Registration Protocol (MRP) and is defined in the IEEE 802.1ak standard. MRP and MVRP were designed by IEEE to perform the same functions as GARP and GVRP while overcoming some GARP and GVRP limitations, in particular limitations involving bandwidth usage and convergence times in large networks with large numbers of VLANs. MVRP was created by IEEE as a replacement application for GVRP.

The VLAN registration information sent by MVRP and GVRP includes the current VLANs membership—that is, which switches are members of which VLANs—and which switch interfaces are in which VLAN. GVRP and MVRP share all VLAN information configured on a local switch.

MVRP can also be used to dynamically create VLANs, which are VLANs created on one switch and propagated to other switches as part of the MVRP message exchange process.

As part of ensuring that VLAN membership information is current, GVRP and MVRP remove switches and interfaces from the VLAN information when those switches and interfaces become unavailable. Pruning VLAN information has these benefits:

- Limits the network VLAN configuration to active participants only, reducing network overhead.
- Targets the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.

Routed VLAN Interface

In a traditional network, broadcast domains consist of either physical interfaces connected to a single switch or logical interfaces connected to one or more switches through VLAN configurations. Switches send traffic to hosts that are part of the same broadcast domain, but routers are needed to route traffic from one broadcast domain to another and to perform other Layer 3 functions such as traffic engineering. J-EX Series switches use a Layer 3 routed VLAN interface (RVI) named **vlan** to perform these routing functions, using it to route data to other Layer 3 interfaces. The RVI functions as a logical router, eliminating the need for having both a switch and a router.

The RVI (the **vlan** interface) must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed out of it. The RVI supports IPv4, IPv6, MPLS, and IS-IS traffic. At least one Layer 2 logical interface must be operational for the RVI to be operational. You must configure a broadcast domain or VPLS routing instance for the RVI just as you would configure a VLAN on the switch. Multicast data, broadcast data, or unicast data is switched between ports within the same RVI broadcast domain or VPLS routing instance. The RVI routes data that is destined for the switch's media access control (MAC) address.

Jumbo frames of up to 9216 bytes are supported on an RVI. To route jumbo data packets on the RVI, you must configure the jumbo MTU size on the member physical interfaces of the RVI and not on the RVI itself (the **vlan** interface). However, for jumbo control packets—for example, to ping the RVI with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the interface named **vlan** (the RVI).

CAUTION: Setting or deleting the jumbo MTU size on the RVI (the vlan interface) while the switch is transmitting packets might result in dropped packets.

See "Configuring Routed VLAN Interfaces (CLI Procedure)" on page 1137.

To learn more about configuring routing protocols and policies, see the *Junos OS Routing Protocols Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

Understanding Private VLANs on J-EX Series Switches

The private VLAN (PVLAN) feature on J-EX Series Switches allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN. Just like regular VLANs, PVLANs are isolated on Layer 2 and require that a Layer 3 device be used to route traffic among them. Private VLANs are useful for restricting the flow of broadcast and unknown unicast traffic and for limiting the communication between known hosts.

NOTE: Configuring a voice over IP (VoIP) VLAN on PVLAN interfaces is not supported.

In a private VLAN, one VLAN is designated the primary VLAN, and other VLANs are nested inside that VLAN as secondary VLANs.

- Primary—A VLAN used to forward frames downstream to isolated and community VLANs.
- Isolated—A secondary VLAN that receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN.
- Community—A secondary VLAN that transports frames among community interfaces within the same community and forwards frames upstream to the primary VLAN.

Private VLANs provide IP address conservation and efficient allocation of those IP addresses. In a typical network, VLANs usually correspond to a single IP subnet. In private VLANs, the hosts in all the secondary VLANs still belong to the same IP subnet as the subnet allocated to the primary VLAN. Hosts within the secondary VLAN are numbered out of IP subnets associated with the primary VLAN, and their IP subnet masking information reflects that of the primary VLAN subnet. Any primary routed VLAN interfaces (RVIs) perform functions similar to proxy ARP to enable communication between hosts that are members of a different secondary VLAN.

NOTE: If you enable no-mac-learning on a primary VLAN, all isolated VLANs in that private VLAN inherit that setting. If you want to disable MAC address learning on any community VLANs, you must configure no-mac-learning on each of those VLANs.

Understanding Virtual Routing Instances on J-EX Series Switches

Virtual routing instances allow administrators to divide a J-EX Series Switch into multiple independent virtual routers, each with its own routing table. Splitting a device into many virtual routing instances isolates traffic traveling across the network without requiring multiple devices to segment the network.

You can use virtual routing instances to isolate customer traffic on your network and to bind customer-specific instances to customer-owned interfaces.

Virtual routing and forwarding (VRF) is often used in conjunction with Layer 3 subinterfaces, allowing traffic on a single physical interface to be differentiated and associated with multiple virtual routers. Each logical Layer 3 subinterface can belong to only one routing instance.

J-EX Series switches support IPv4 and IPv6 unicast and multicast VRF traffic.

J-EX4200 Series Ethernet Switches support up to 252 IPv4 virtual routing instances and up to 64 IPv6 virtual routing instances. J-EX8200 Series Ethernet Switches support up to 252 IPv4 and IPv6 virtual routing instances.

Understanding Redundant Trunk Links on J-EX Series Switches

In a typical enterprise network comprised of distribution and access layers, a redundant trunk link provides a simple solution for network recovery when a trunk port goes down. Traffic is routed to another trunk port, keeping network convergence time to a minimum. You can configure a maximum of 16 redundant trunk groups on a standalone switch or on a Virtual Chassis.

To configure a redundant trunk link, create a redundant trunk group. The redundant trunk group is configured on the access switch, and contains two links: a primary or active link, and a secondary link. If the active link fails, the secondary link automatically starts forwarding data traffic without waiting for normal STP convergence.

Data traffic is forwarded only on the active link. Data Traffic on the secondary link is dropped and shown as dropped packets when you issue the operational mode command **show interfaces xe-** ***interface-name*** **extensive**.

While data traffic is blocked on the secondary link, Layer 2 control traffic is still permitted. For example, an LLDP session can be run between two J-EX Series Switches on the secondary link.

STP is enabled by default on J-EX Series switches to create a loop-free topology. When trunk links are placed in a redundant group, they cannot be part of an STP topology. The Junos OS for J-EX Series switches does not allow an interface to be in a redundant trunk group and in an STP topology at the same time. However, STP can continue operating in other parts of the network. For example, STP may continue operating between the distribution switches and linking them to the enterprise core.

Figure 26 on page 1050 shows three switches in a basic topology for redundant trunk links. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk ports **ge-0/0/9.0** (Link 1) and **ge-0/0/10.0** (Link 2). Link 1 and Link 2 are in a redundant trunk group called **group1**. Link 1 is designated as the primary link. Traffic flows between Switch 3 in the access layer and Switch 1 in the distribution layer through Link 1. While Link 1 is active, Link 2 blocks traffic.

Figure 26: Redundant Trunk Group, Link 1 Active

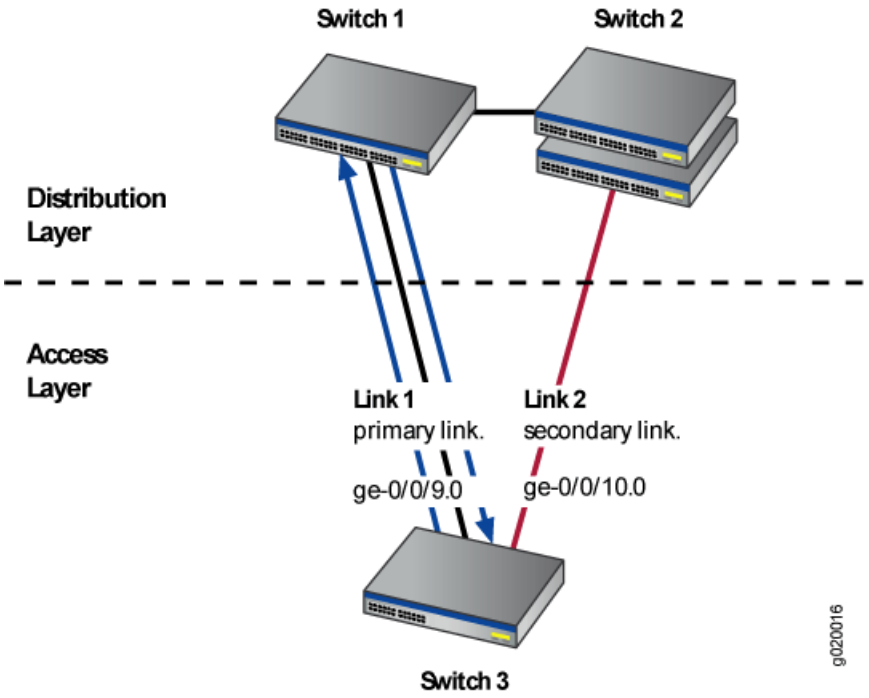

Figure 27 on page 1050 illustrates how the redundant trunk link topology works when the primary link goes down.

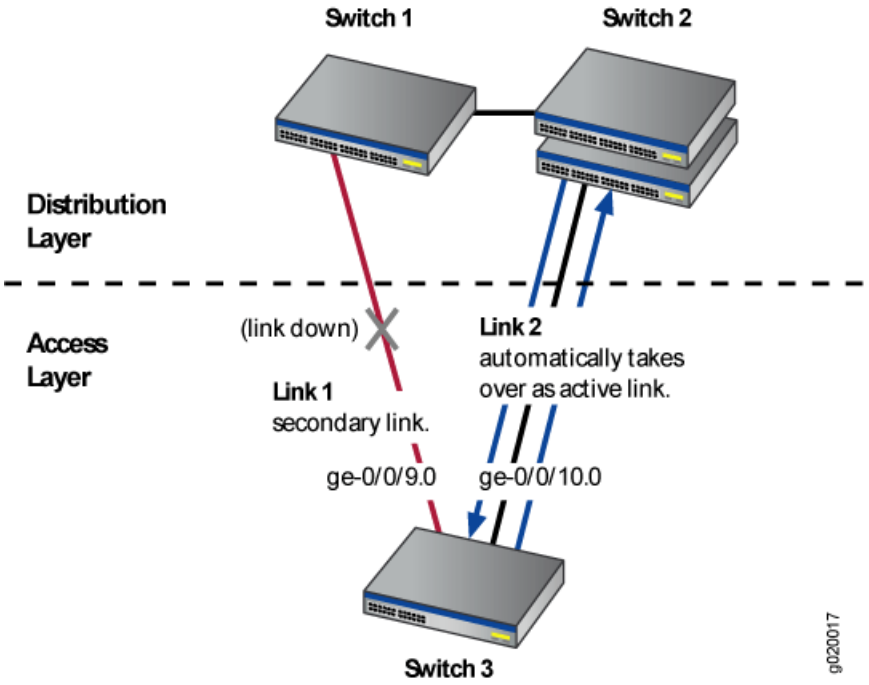
Figure 27: Redundant Trunk Group, Link 2 Active



Link 1 is down between Switch 3 and Switch 1. Link 2 takes over as the active link. Traffic between the access layer and the distribution layer is automatically switched to Link 2 between Switch 1 and Switch 2.

Understanding Q-in-Q Tunneling on J-EX Series Switches

Q-in-Q tunneling allows service providers on Ethernet access networks to extend a Layer 2 Ethernet connection between two customer sites. Using Q-in-Q tunneling, providers can also segregate or bundle customer traffic into fewer VLANs or different VLANs by adding another layer of 802.1Q tags. Q-in-Q tunneling is useful when customers have overlapping VLAN IDs, because the customer's 802.1Q (dot1Q) VLAN tags are prepended by the service VLAN (S-VLAN) tag. The Junos OS implementation of Q-in-Q tunneling supports the IEEE 802.1ad standard.

This topic describes:

- How Q-in-Q Tunneling Works on page 1051
- Disabling MAC Address Learning on page 1052
- Mapping C-VLANs to S-VLANs on page 1052
- Routed VLAN Interfaces on Q-in-Q VLANs on page 1053
- Limitations for Q-in-Q Tunneling on page 1054

How Q-in-Q Tunneling Works

In Q-in-Q tunneling, as a packet travels from a customer VLAN (C-VLAN) to a service provider's VLAN, a customer-specific 802.1Q tag is added to the packet. This additional tag is used to segregate traffic into service-provider-defined service VLANs (S-VLANs). The original customer 802.1Q tag of the packet remains and is transmitted transparently, passing through the service provider's network. As the packet leaves the S-VLAN in the downstream direction, the extra 802.1Q tag is removed.

When Q-in-Q tunneling is enabled on J-EX Series Switches, trunk interfaces are assumed to be part of the service provider network and access interfaces are assumed to be customer facing. An access interface can receive both tagged and untagged frames in this case.

An interface can be a member of multiple S-VLANs. You can map one C-VLAN to one S-VLAN (1:1) or multiple C-VLANs to one S-VLAN (N:1). Packets are double-tagged for an additional layer of segregating or bundling of C-VLANs. C-VLAN and S-VLAN tags are unique; so you can have both a C-VLAN 101 and an S-VLAN 101, for example. You can limit the set of accepted customer tags to a range of tags or to discrete values. Class-of-service (CoS) values of C-VLANs are unchanged in the downstream direction. You may, optionally, copy ingress priority and CoS settings to the S-VLAN. Using private VLANs, you can isolate users to prevent the forwarding of traffic between user interfaces even if the interfaces are on the same VLAN.

You can use the **native** option to specify an S-VLAN for untagged and priority tagged packets when using many-to-one bundling and mapping a specific interface approaches to map C-VLANs to S-VLANs. Otherwise the packets are discarded. The **native** option is not available for all-in-one bundling because there is no need to specify untagged and priority tagged packets when all packets are mapped to the C-VLAN. See the Mapping C-VLANs to S-VLANs section of this document for information on the methods of mapping C-VLANs to S-VLANs.

Firewall filters allow you to map an interface to a VLAN based on a policy. Using firewall filters to map an interface to a VLAN is useful when you want a subset of traffic from a port to be mapped to a selected VLAN instead of the designated VLAN. To configure a firewall filter to map an interface to a VLAN, the **vlan** option has to be configured as part of the firewall filter and the **mapping policy** option must be specified in the interface configuration for each logical interface using the filter.

Disabling MAC Address Learning

In a Q-in-Q deployment, customer packets from downstream interfaces are transported without any changes to source and destination MAC addresses. You can disable MAC address learning at both the interface level and the VLAN level. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member. When you disable MAC address learning on a VLAN, MAC addresses that have already been learned are flushed.

If you disable MAC address learning on an interface or a VLAN, you cannot include MAC move limiting or 802.1X authentication in that same VLAN configuration.

When a routed VLAN interface (RVI) is associated with either an interface or a VLAN on which MAC address learning is disabled, the Layer 3 routes resolved on that VLAN or that interface are not resolved with the Layer 2 component. This results in routed packets flooding all the interfaces associated with the VLAN.

Mapping C-VLANs to S-VLANs

There are three ways to map C-VLANs to an S-VLAN:

- All-in-one bundling—Use the **dot1q-tunneling** option to map without specifying customer VLANs. All packets from all access interfaces are mapped to the S-VLAN.
- Many-to-one bundling—Use the **customer-vlans** option to specify which C-VLANs are mapped to the S-VLAN.
- Mapping a specific interface—Use the **mapping** option to indicate a specific S-VLAN for a given C-VLAN. The specified C-VLAN applies to only one VLAN and not all access interfaces as in the cases of all-in-one and many-to-one bundling.

If you configure multiple methods, the switch gives priority to mapping a specific interface, then to many-to-one bundling, and last to all-in-one bundling. However, you cannot have overlapping rules for the same C-VLAN under a given approach.

- All-in-One Bundling on page 1053
- Many-to-One Bundling on page 1053
- Mapping a Specific Interface on page 1053

All-in-One Bundling

All-in-one bundling maps all packets from all access interfaces to the S-VLAN. All-in-one bundling is configured using the **dot1q-tunneling** option without specifying customer VLANs.

When all-in-one bundling is used, all packets leaving the C-VLAN, including untagged and priority tagged packets, enter the S-VLAN.

Many-to-One Bundling

Many-to-one bundling is used to specify which C-VLANs are mapped to an S-VLAN. Many-to-one bundling is configured using the **customer-vlans** option.

Many-to-one bundling is used when you want a subset of the C-VLANs on the access switch to be part of the S-VLAN. When using many-to-one bundling, untagged and priority tagged packets can be mapped to the S-VLAN when the **native** option is specified along with the **customer-vlans** option.

Mapping a Specific Interface

Use the mapping a specific interface approach when you want to assign an S-VLAN to a specific C-VLAN on an interface. The mapping a specific interface configuration only applies to the configured interface, not to all access interfaces as in the cases of the all-in-one bundling and many-to-one bundling approaches. The mapping a specific interface approach is configured using the **mapping** option to indicate a specific S-VLAN for a given C-VLAN.

The mapping a specific interface approach has two suboptions for treatment of traffic: swap and push. When traffic that is mapped to a specific interface is pushed, the packet retains its tag as it moves between the S-VLAN and C-VLAN and an additional VLAN tag is added to the packet. When traffic that is mapped to a specific interface is swapped, the incoming tag is replaced with a new VLAN tag. Using the **swap** option is also referred to as VLAN ID translation.

It might be useful to have S-VLANs that provide service to multiple customers. Each customer will typically have its own S-VLAN plus access to one or more S-VLANs that are used by multiple customers. A specific tag on the customer side is mapped to an S-VLAN. Typically, this functionality is used to keep data from different customers separate or to provide individualized treatment of the packets on a certain interface.

Routed VLAN Interfaces on Q-in-Q VLANs

Routed VLAN interfaces (RVIs) are supported on Q-in-Q VLANs.

Packets arriving on an RVI that is using Q-in-Q VLANs will get routed regardless of whether the packet is single or double tagged. The outgoing routed packets contain an S-VLAN tag only when exiting a trunk interface; the packets exit the interface untagged when exiting an access interface.

Limitations for Q-in-Q Tunneling

Q-in-Q tunneling does not support most access port security features. There is no per-VLAN (customer) policing or per-VLAN (outgoing) shaping and limiting with Q-in-Q tunneling unless you configure these security features using firewall filters.

Understanding Multiple VLAN Registration Protocol (MVRP) on J-EX Series Switches

You can configure Multiple VLAN Registration Protocol (MVRP) on J-EX Series Switches. The primary purpose of MVRP is to manage dynamic VLAN registration in a LAN. In managing dynamic VLAN registration, MVRP also prunes VLAN information. MVRP can also be used to dynamically create VLANs in switching networks.

MVRP is an application protocol of the Multiple Registration Protocol (MRP) and is defined in the IEEE 802.1ak standard. MRP and MVRP were designed by IEEE to perform the same functions as Generic Attribute Registration Protocol (GARP) and GARP VLAN Registration Protocol (GVRP) while overcoming some GARP and GVRP limitations, in particular limitations involving bandwidth usage and convergence time in large networks with large numbers of VLANs.

MVRP was created by IEEE as a replacement application for GVRP. MVRP and GVRP cannot be run concurrently to share VLAN information in a switching network.

This topic describes:

- How MVRP Works on J-EX Series Switches on page 1054
- Basics of MVRP on J-EX Series Switches on page 1055
- MVRP Registration Modes on page 1055
- MRP Timers on page 1055
- MRP VLAN Messages on page 1056

How MVRP Works on J-EX Series Switches

The VLAN registration information sent by MVRP protocol data units (PDUs) includes the current VLANs membership—that is, which switches are members of which VLANs—and which switch interfaces are in which VLAN. MVRP shares all information in the PDU with all switches participating in MVRP in the switching network.

MVRP stays synchronized using these PDUs. The MVRP PDUs are sent to other switches on the network only when an MVRP state change occurs. The switches in the network

participating in MVRP receive these PDUs during state changes and update their MVRP states accordingly. MVRP timers dictate when PDUs can be sent and when switches receiving MVRP PDUs can update their MVRP information.

VLAN information is distributed as part of the MVRP message exchange process and can be used to dynamically create VLANs, which are VLANs created on one switch and propagated to other switches as part of the MVRP message exchange process. Dynamic VLAN creation using MVRP is enabled by default but can be disabled.

As part of ensuring that VLAN membership information is current, MVRP removes switches and interfaces from the VLAN information when they become unavailable. Pruning VLAN information has these benefits:

- Limits the network VLAN configuration to active participants only, reducing network overhead.
- Targets the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.

Basics of MVRP on J-EX Series Switches

MVRP is disabled by default on all J-EX Series switches. You can configure MVRP on J-EX Series switch interfaces to participate in MVRP for the switching network. MVRP can only be enabled on trunk interfaces, and dynamic VLAN configuration through MVRP is enabled by default when MVRP is enabled.

MVRP Registration Modes

The MVRP registration mode defines whether an interface does or does not participate in MVRP.

The following MVRP registration modes are configurable:

- forbidden—The interface does not register and does not participate in MVRP.
- normal—The interface accepts MVRP messages and participates in MVRP. This is the default registration mode setting.

MRP Timers

MVRP registration and updates are controlled by timers that are part of the MRP protocol. These timers are set on a per-interface basis and define when MVRP PDUs can be sent and when MVRP information can be updated on a switch.

The following timers are used to control the operation of MVRP:

- Join timer—Controls the interval for the next MVRP PDU transmit opportunity.
- Leave timer—Controls the period of time that an interface on the switch waits in the Leave state before changing to the unregistered state.
- LeaveAll timer—Controls the frequency with which the interface generates LeaveAll messages.

BEST PRACTICE: Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

MRP VLAN Messages

MVRP uses MRP messages to register and declare MVRP states for a switch and to inform the switching network that a switch is leaving MVRP. These messages are communicated as part of the PDU to communicate the state of a particular switch interface on the switching network to the other switches in the network.

The following messages are communicated for MVRP:

- Empty—VLAN information is not being declared and is not registered.
- In—VLAN information is not being declared but is registered.
- JoinEmpty—VLAN information is being declared but not registered.
- JoinIn—VLAN information is being declared and is registered.
- Leave—VLAN information that was previously registered is being withdrawn.
- LeaveAll—All registrations will be de-registered. Participants that want to participate in MVRP will need to re-register.
- New—VLAN information is new and possibly not previously registered.

Understanding Layer 2 Protocol Tunneling on J-EX Series Switches

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to J-EX Series Switches that are not part of the local broadcast domain. This feature is useful when you want to run Layer 2 protocols on a network that includes switches located at remote sites that are connected across a service provider network.

This topic includes:

- Layer 2 Protocols Supported by L2PT on J-EX Series Switches on page 1057
- How L2PT Works on page 1057
- L2PT Basics on J-EX Series Switches on page 1058

Layer 2 Protocols Supported by L2PT on J-EX Series Switches

L2PT on J-EX Series switches supports the following Layer 2 protocols:

- 802.1X authentication
- 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM)

NOTE: If you enable L2PT for untagged OAM LFM packets, do not configure LFM on the corresponding access interface.

- Cisco Discovery Protocol (CDP)
- Ethernet local management interface (E-LMI)
- GARP VLAN Registration Protocol (GVRP)
- Link Aggregation Control Protocol (LACP)

NOTE: If you enable L2PT for untagged LACP packets, do not configure LACP on the corresponding access interface.

- Link Layer Discovery Protocol (LLDP)
- Multiple MAC Registration Protocol (MMRP)
- Multiple VLAN Registration Protocol (MVRP)
- Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP)
- VLAN Spanning Tree Protocol (VSTP)
- VLAN Trunking Protocol (VTP)

NOTE: CDP and VTP cannot be configured on J-EX Series switches. L2PT does, however, tunnel CDP and VTP PDUs.

How L2PT Works

L2PT works by encapsulating Layer 2 PDUs, tunneling them across a service provider network, and decapsulating them for delivery to their destination switches. L2PT encapsulates Layer 2 PDUs by enabling the ingress provider edge (PE) device to rewrite the PDUs' destination media access control (MAC) addresses before forwarding them onto the service provider network. The devices in the service provider network treat these encapsulated PDUs as multicast Ethernet packets. Upon receipt of these PDUs, the egress PE devices decapsulate them by replacing the destination MAC addresses with the address of the Layer 2 protocol that is being tunneled before forwarding the PDUs to their destination switches.

L2PT Basics on J-EX Series Switches

L2PT is enabled on a per-VLAN basis. When you enable L2PT on a VLAN, all access interfaces are considered to be customer-facing interfaces, all trunk interfaces are considered to be service provider network-facing interfaces, and the specified Layer 2 protocol is disabled on the access interfaces. L2PT only acts on logical interfaces of the family **ethernet-switching**.

NOTE: Access interfaces in an L2PT-enabled VLAN should not receive L2PT-tunneled PDUs. If an access interface does receive L2PT-tunneled PDUs, it might mean that there is a loop in the network. As a result, the interface will be shut down.

L2PT is configured under the **[edit vlans *vlan-name* dot1q-tunneling]** hierarchy level, meaning Q-in-Q tunneling is (and must be) enabled. If L2PT is not enabled, Layer 2 PDUs are handled in the same way they were handled before L2PT was enabled.

NOTE: If the switch receives untagged or priority-tagged Layer 2 control PDUs to be tunnelled, then you must configure the switch to map untagged and priority-tagged packets to an L2PT-enabled VLAN. For more information on assigning untagged and priority-tagged packets to VLANs, see “Understanding Q-in-Q Tunneling on J-EX Series Switches” on page 1051 and “Configuring Q-in-Q Tunneling (CLI Procedure)” on page 1144.

Understanding Proxy ARP on EX Series Switches

You can configure proxy Address Resolution Protocol (ARP) on your J-EX Series Ethernet switch to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

Proxy ARP is useful in situations where hosts are on different physical networks and you do not want to use subnet masking. Because ARP broadcasts are not propagated between hosts on different physical networks, hosts will not receive a response to their ARP request if the destination is on a different subnet. Enabling the switch to act as an ARP proxy allows the hosts to transparently communicate with each other through the switch. Proxy ARP can help hosts on a subnet reach remote subnets without your having to configure routing or a default gateway.

What Is ARP?

Ethernet LANs use ARP to map Ethernet MAC addresses to IP addresses. Each device maintains a cache containing a mapping of MAC addresses to IP addresses. The switch maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

Proxy ARP Overview

When proxy ARP is enabled, if the switch receives an ARP request for which it has a route to the target (destination) IP address, the switch responds by sending a proxy ARP reply packet containing its own MAC address. The host that sent the ARP request then sends its packets to the switch, which forwards them to the intended host.

NOTE: For security reasons, the source address in an ARP request must be on the same subnet as the interface on which the ARP request is received.

You can configure proxy ARP for each interface. You can also configure proxy ARP for a VLAN by using a routed VLAN interface (RVI).

J-EX Series switches support two modes of proxy ARP, restricted and unrestricted. Both modes require that the switch have an active route to the destination address of the ARP request.

- Restricted—The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are on the same subnet. In this mode, hosts on the same subnet communicate without proxy ARP. We recommend that you use this mode on the switch.

- Unrestricted—The switch responds to all ARP requests for which it has a route to the destination. This is the default mode (because it is the default mode in the Junos operating system (Junos OS) configurations other than those on the switch). We recommend using restricted mode on the switch.

Best Practices for Proxy ARP on J-EX Series Switches

We recommend these best practices for configuring proxy ARP on the switches:

- Set proxy ARP to restricted mode.
- Use restricted mode when configuring proxy ARP on RVIs.
- If you set proxy ARP to unrestricted, disable gratuitous ARP requests on each interface enabled for proxy ARP.

Understanding MAC Notification on J-EX Series Switches

J-EX Series Switches track clients on a network by storing Media Access Control (MAC) addresses in the Ethernet switching table on the switch. When switches learn or unlearn a MAC address, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as MAC notification.

The MAC Notification MIB controls MAC notification for the network management system. For general information on the MAC Notification MIB, see the *Junos OS Network Management Configuration Guide* at http://www.juniper.net/techpubs/software/junos/index.html.

The MAC notification interval defines how often these SNMP notifications are sent to the network management system. The MAC notification interval works by tracking all of the MAC address additions or removals on the switch over a period of time and then sending all of the tracked MAC address additions or removals to the network management server at the end of the interval. For instance, if the MAC notification interval is set to 10, all of the MAC address addition and removal SNMP notifications are sent to the network management system every 10 seconds.

Enabling MAC notification allows users to monitor the addition and removal of MAC addresses from the Ethernet switching table remotely using a network management system. The advantage of setting a high MAC notification interval is that the amount of network traffic is reduced because updates are sent less frequently. The advantage of setting a low MAC notification interval is that the network management system is better synchronized with the switch.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

CHAPTER 58

Examples: Bridging and VLAN Configuration

Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch

J-EX Series switches use bridging and virtual LANs (VLANs) to connect network devices in a LAN—desktop computers, IP telephones, printers, file servers, wireless access points, and others—and to segment the LAN into smaller bridging domains. The switch's default configuration provides a quick setup of bridging and a single VLAN.

This example describes how to configure basic bridging and VLANs for a J-EX Series switch:

Requirements

This example uses the following software and hardware components:

- One J-EX4200 Virtual Chassis switch

Before you set up bridging and a VLAN, be sure you have:

- Installed your J-EX Series switch. See Installing and Connecting a J-EX4200 Switch.
- Performed the initial switch configuration. See "Connecting and Configuring a J-EX Series Switch (J-Web Procedure)" on page 163.

Overview and Topology

J-EX Series switches connect network devices in an office LAN or a data center LAN to provide sharing of common resources such as printers and file servers and to enable wireless devices to connect to the LAN through wireless access points. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN.

To use a J-EX Series switch to connect network devices on a LAN, you must, at a minimum, configure bridging and VLANs. If you simply power on the switch and perform the initial switch configuration using the factory-default settings, bridging is enabled on all the switch's interfaces, all interfaces are in access mode, and all interfaces belong to a VLAN called **default**, which is automatically configured. When you plug access devices—such as desktop computers, Avaya IP telephones, file servers, printers, and wireless access points—into the switch, they are joined immediately into the **default** VLAN and the LAN is up and running.

The topology used in this example consists of one J-EX4200-24T switch, which has a total of 24 ports. Eight of the ports support Power over Ethernet (PoE), which means they provide both network connectivity and electric power for the device connecting to the port. To these ports, you can plug in devices requiring PoE, such as Avaya VoIP telephones, wireless access points, and some IP cameras. (Avaya phones have a built-in hub that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one port on the switch.) The remaining 16 ports provide only network connectivity. You use them to connect devices that have their own power sources, such as desktop and laptop computers, printers, and servers. Table 1 details the topology used in this configuration example.

Table 142: Components of the Basic Bridging Configuration Topology

Property	Settings
Switch hardware	J-EX4200-24T switch, with 24 Gigabit Ethernet ports: 8 PoE ports (**ge-0/0/0** through **ge-0/0/7**) and 16 non-PoE ports (**ge-0/0/8** through **ge-0/0/23**)
VLAN name	**default**
Connection to wireless access point (requires PoE)	**ge-0/0/0**

Table 142: Components of the Basic Bridging Configuration Topology *(continued)*

Property	Settings
Connections to Avaya IP telephone—with integrated hub, to connect phone and desktop PC to a single port (requires PoE)	**ge-0/0/1** through **ge-0/0/7**
Direct connections to desktop PCs (no PoE required)	**ge-0/0/8** through **ge-0/0/12**
Connections to file servers (no PoE required)	**ge-0/0/17** and **ge-0/0/18**
Connections to integrated printer/fax/copier machines (no PoE required)	**ge-0/0/19** through **ge-0/0/20**
Unused ports (for future expansion)	**ge-0/0/13** through **ge-0/0/16**, and **ge-0/0/21** through **ge-0/0/23**

Configuration

CLI Quick Configuration

By default, after you perform the initial configuration on the J-EX4200 switch, switching is enabled on all interfaces, a VLAN named **default** is created, and all interfaces are placed into this VLAN. You do not need to perform any other configuration on the switch to set up bridging and VLANs. To use the switch, simply plug the Avaya IP phones into the PoE-enabled ports **ge-0/0/1** through **ge-0/0/7**, and plug in the PCs, file servers, and printers to the non-PoE ports, **ge-0/0/8** through **ge-0/0/12** and **ge-0/0/17** through **ge-0/0/20**.

Step-by-Step Procedure

To configure bridging and VLANs:

1. Make sure the switch is powered on.
2. Connect the wireless access point to switch port **ge-0/0/0**.
3. Connect the seven Avaya phones to switch ports **ge-0/0/1** through **ge-0/0/7**.
4. Connect the five PCs to ports **ge-0/0/8** through **ge-0/0/12**.
5. Connect the two file servers to ports **ge-0/0/17** and **ge-0/0/18**.
6. Connect the two printers to ports **ge-0/0/19** and **ge-0/0/20**.

Results

Check the results of the configuration:

Verification

To verify that switching is operational and that a VLAN has been created, perform these tasks:

- Verifying That the VLAN Has Been Created on page 1069
- Verifying That Interfaces Are Associated with the Proper VLANs on page 1069

Verifying That the VLAN Has Been Created

Purpose Verify that the VLAN named **default** has been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans

Name            Tag     Interfaces
default
                        ge-0/0/0.0*, ge-0/0/1.0, ge-0/0/2.0, ge-0/0/3.0,
                        ge-0/0/4.0,  ge-0/0/5.0, ge-0/0/6.0, ge-0/0/7.0,
                        ge-0/0/8.0*, ge-0/0/9.0, ge-0/0/10.0, ge-0/0/11.0*,
                        ge-0/0/12.0, ge-0/0/13.0, ge-0/0/14.0, ge-0/0/15.0,
                        ge-0/0/16.0, ge-0/0/17.0, ge-0/0/18.0, ge-0/0/19.0*,
                        ge-0/0/20.0, ge-0/0/21.0, ge-0/0/22.0, ge-0/0/23.0,
                        ge-0/1/0.0*, ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0*
mgmt
                        me0.0*
```

Meaning The **show vlans** command lists the VLANs configured on the switch. This output shows that the VLAN **default** has been created.

Verifying That Interfaces Are Associated with the Proper VLANs

Purpose Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.

Action List all interfaces on which switching is enabled:

```
user@switch> show ethernet-switching interfaces

Interface   State    VLAN members           Blocking
ge-0/0/0.0  up       default                unblocked
ge-0/0/1.0  down     default                blocked - blocked by STP/RTG
ge-0/0/2.0  down     default                blocked - blocked by STP/RTG

ge-0/1/1.0  up       default              unblocked
ge-0/1/2.0  up       default              unblocked
ge-0/1/3.0  up       default              unblocked
me0.0       up       mgmt                 unblocked
```

Meaning The **show ethernet-switching interfaces** command lists all interfaces on which switching is enabled (in the **Interfaces** column), along with the VLANs that are active on the interfaces (in the **VLAN members** column). The output in this example shows all the connected interfaces, **ge-0/0/0** through **ge-0/0/12** and **ge-0/0/17** through **ge-0/0/20** and that they are all part of VLAN **default**. Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows **ge-0/0/0.0** instead of **ge-0/0/0**. This is because the Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

- Understanding Bridging and VLANs on J-EX Series Switches on page 1041

Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a J-EX Series switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure bridging for a J-EX Series switch and how to create two VLANs to segment the LAN:

Requirements

This example uses the following hardware and software components:

- One J-EX4200-48T Virtual Chassis switch

Before you set up bridging and VLANs, be sure you have:

- Installed the J-EX Series switch. See Installing and Connecting a J-EX4200 Switch.
- Performed the initial switch configuration. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.

Overview and Topology

J-EX Series switches connect all devices in an office or data center into a single LAN to provide sharing of common resources such as printers and file servers and to enable wireless devices to connect to the LAN through wireless access points. The default configuration creates a single VLAN, and all traffic on the switch is part of that broadcast domain. Creating separate network segments reduces the span of the broadcast domain and allows you to group related users and network resources without being limited by physical cabling or by the location of a network device in the building or on the LAN.

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch. One VLAN, called **sales**, is for the sales and marketing group, and a second, called **support**, is for the customer support team. The sales and support groups each have their own dedicated file servers, printers, and wireless access points. For the switch ports to be segmented across the two VLANs, each VLAN must have its own broadcast domain, identified by a unique name and tag (VLAN ID). In addition, each VLAN must be on its own distinct IP subnet.

The topology for this example consists of one J-EX4200-48T switch, which has a total of 48 Gigabit Ethernet ports, 8 which support Power over Ethernet (PoE). Some of the switch ports connect to Avaya IP telephones. Other ports connect to wireless access points, file servers, and printers.

Table 143: Components of the Multiple VLAN Topology

Property	Settings
Switch hardware	J-EX4200-48T, 48 Gigabit Ethernet ports, 8 of them PoE-enabled (**ge-0/0/0** through **ge-0/0/07**)

Table 143: Components of the Multiple VLAN Topology *(continued)*

Property	Settings
VLAN names and tag IDs	**sales**, tag **100** **support**, tag **200**
VLAN subnets	**sales**: **192.0.2.0/25** (addresses **192.0.2.1** through **192.0.2.126**) **support**: **192.0.2.128/25** (addresses **192.0.2.129** through **192.0.2.254**)
Interfaces in VLAN **sales**	Avaya IP telephones: **ge-0/0/2** through **ge-0/0/4** Wireless access point: **ge-0/0/0** Printers: **ge-0/0/22** and **ge-0/0/23** File servers: **ge-0/0/20** and **ge-0/0/21**
Interfaces in VLAN **support**	Avaya IP telephones: **ge-0/0/5** through **ge-0/0/7** Wireless access point: **ge-0/0/1** Printers: **ge-0/0/44** and **ge-0/0/45** File servers: **ge-0/0/46** and **ge-0/0/47**
Unused interfaces	**ge-0/0/8** through **ge0/0/19** and **ge-0/0/24** through **ge–0/0/43**

This configuration example creates two IP subnets, one for the sales VLAN and the second for the support VLAN. The switch bridges traffic within a VLAN. For traffic passing between two VLANs, the switch routes the traffic using a Layer 3 routing interface on which you have configured the address of the IP subnet.

To keep the example simple, the configuration steps show only a few devices in each of the VLANs. Use the same configuration procedure to add more LAN devices.

Configuration

Configure Layer 2 switching for two VLANs:

CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**sales** and **support**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 description “Sales wireless access point port”
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description “Sales phone port”
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description “Sales printer port”
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description “Sales file server port”
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/1 unit 0 description “Support wireless access point port”
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/6 unit 0 description “Support phone port”
set interfaces ge-0/0/6 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description “Support printer port”
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description “Support file server port”
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
```

```
set interfaces vlan unit 0 family inet address 192.0.2.0/25
set interfaces vlan unit 1 family inet address 192.0.2.128/25
set vlans sales l3–interface vlan.0
set vlans sales vlan-id 100
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

Step-by-Step Procedure

Configure the switch interfaces and the VLANs to which they belong. By default, all interfaces are in access mode, so you do not have to configure the port mode.

1. Configure the interface for the wireless access point in the sales VLAN:

```
[edit interfaces ge-0/0/0 unit 0]
user@switch# set description “Sales wireless access point port”
user@switch# set family ethernet-switching vlan members sales
```

2. Configure the interface for the Avaya IP phone in the sales VLAN:

```
[edit interfaces ge-0/0/3 unit 0]
user@switch# set description “Sales phone port”
user@switch# set family ethernet-switching vlan members sales
```

3. Configure the interface for the printer in the sales VLAN:

```
[edit interfaces ge-0/0/22 unit 0]
user@switch# set description “Sales printer port”
user@switch# set family ethernet-switching vlan members sales
```

4. Configure the interface for the file server in the sales VLAN:

```
[edit interfaces ge-0/0/20 unit 0]
user@switch# set description “Sales file server port”
user@switch# set family ethernet-switching vlan members sales
```

5. Configure the interface for the wireless access point in the support VLAN:

```
[edit interfaces ge-0/0/1 unit 0]
user@switch# set description “Support wireless access point port”
user@switch# set family ethernet-switching vlan members support
```

6. Configure the interface for the Avaya IP phone in the support VLAN:

```
[edit interfaces ge-0/0/6 unit 0]
user@switch# set description “Support phone port”
user@switch# set family ethernet-switching vlan members support
```

7. Configure the interface for the printer in the support VLAN:

```
[edit interfaces ge-0/0/44 unit 0]
user@switch# set description “Support printer port”
user@switch# set family ethernet-switching vlan members support
```

8. Configure the interface for the file server in the support VLAN:

```
[edit interfaces ge-0/0/46 unit 0]
user@switch# set description “Support file server port”
user@switch# set family ethernet-switching vlan members support
```

9. Create the subnet for the sales broadcast domain:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address 192.0.2.1/25
```

10. Create the subnet for the support broadcast domain:

```
[edit interfaces]
user@switch# set vlan unit 1 family inet address 192.0.2.129/25
```

11. Configure the VLAN tag IDs for the sales and support VLANs:

```
[edit vlans]
user@switch# set sales vlan-id 100
user@switch# set support vlan-id 200
```

12. To route traffic between the sales and support VLANs, define the interfaces that are members of each VLAN and associate a Layer 3 interface:

```
[edit vlans]
user@switch# set sales l3-interface
user@switch# set support l3-interface vlan.1
```

Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  ge-0/0/0 {
    unit 0 {
      description “Sales wireless access point port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      description “Sales phone port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/22 {
    unit 0 {
      description “Sales printer port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/20 {
    unit 0 {
      description “Sales file server port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/1 {
    unit 0 {
      description “Support wireless access point port”;
```

```
        family ethernet-switching {
          vlan members support;
        }
      }
    }
    ge-0/0/6 {
      unit 0 {
        description “Support phone port”;
        family ethernet-switching {
          vlan members support;
        }
      }
    }
    ge-0/0/44 {
      unit 0 {
        description “Support printer port”;
        family ethernet-switching {
          vlan members support;
        }
      }
    }
    ge-0/0/46 {
      unit 0 {
        description “Support file server port”;
        family ethernet-switching {
          vlan members support;
        }
      }
      vlans {
        unit 0 {
          family inet address 192.0.2.0/25;
        }
        unit 1 {
          family inet address 192.0.2.128/25;
        }
      }
    }
}
vlans {
  sales {
    vlan-id 100;
    interface ge-0/0/0.0:
    interface ge-0/0/3/0;
    interface ge-0/0/20.0;
    interface ge-0/0/22.0;
    l3-interface vlan 0;
  }
  support {
    vlan-id 200;
    interface ge-0/0/1..0:
    interface ge-0/0/6.0;
    interface ge-0/0/44.0;
    interface ge-0/0/46.0;
    l3-interface vlan 1;
  }
}
```

TIP: To quickly configure the sales and support VLAN interfaces, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

Verification

To verify that the “sales” and “support” VLANs have been created and are operating properly, perform these tasks:

- Verifying That the VLANs Have Been Created and Associated to the Correct Interfaces on page 1076
- Verifying That Traffic Is Being Routed Between the Two VLANs on page 1077
- Verifying That Traffic Is Being Switched Between the Two VLANs on page 1077

Verifying That the VLANs Have Been Created and Associated to the Correct Interfaces

Purpose Verify that the VLANs **sales** and **support** have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

Action List all VLANs configured on the switch:

Use the operational mode commands:

```
user@switch>  show vlans
Name            Tag     Interfaces
default
                        ge-0/0/1.0, ge-0/0/2.0, ge-0/0/4.0, ge-0/0/5.0,
                        ge-0/0/6.0,  ge-0/0/7.0, ge-0/0/8.0, ge-0/0/9.0,
                        ge-0/0/10.0*, ge-0/0/11.0, ge-0/0/12.0, ge-0/0/13.0*,
                        ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0, ge-0/0/17.0,
                        ge-0/0/18.0, ge-0/0/19.0, ge-0/0/21.0, ge-0/0/23.0*,
                        ge-0/0/25.0, ge-0/0/27.0, ge-0/0/28.0, ge-0/0/29.0,
                        ge-0/0/30.0, ge-0/0/31.0, ge-0/0/32.0, ge-0/0/33.0,
                        ge-0/0/34.0, ge-0/0/35.0, ge-0/0/36.0, ge-0/0/37.0,
                        ge-0/0/38.0, ge-0/0/39.0, ge-0/0/40.0, ge-0/0/41.0,
                        ge-0/0/42.0, ge-0/0/43.0, ge-0/0/45.0, ge-0/0/47.0,
                        ge-0/1/0.0*, ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0*

sales       100
                        ge-0/0/0.0*, ge-0/0/3.0, ge-0/0/20.0, ge-0/0/22.0

support     200
                        ge-0/0/1.0, ge-0/0/6.0, ge-0/0/44.0, ge-0/0/46.0*
mgmt
                        me0.0*
```

Meaning The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **sales** and **support** VLANs have been created. The **sales** VLAN has a tag ID of 100 and is associated with interfaces **ge-0/0/0.0**, **ge-0/0/3.0**, **ge-0/0/20.0**, and **ge-0/0/22.0**. VLAN **support** has a

tag ID of 200 and is associated with interfaces **ge-0/0/1.0**, **ge-0/0/6.0**, **ge-0/0/44.0**, and **ge-0/0/46.0**.

Verifying That Traffic Is Being Routed Between the Two VLANs

Purpose Verify routing between the two VLANs.

Action List the Layer 3 routes in the switch's Address Resolution Protocol (ARP) table:

```
user@switch> show arp
MAC Address       Address         Name                      Flags

00:00:0c:06:2c:0d       192.0.2.3       vlan.0                    None
00:13:e2:50:62:e0       192.0.2.11      vlan.1                    None
```

Meaning Sending IP packets on a multiaccess network requires mapping from an IP address to a MAC address (the physical or hardware address). The ARP table displays the mapping between the IP address and MAC address for both **vlan.0** (associated with **sales**) and **vlan.1** (associated with **support**). These VLANs can route traffic to each other.

Verifying That Traffic Is Being Switched Between the Two VLANs

Purpose Verify that learned entries are being added to the Ethernet switching table.

Action List the contents of the Ethernet switching table:

```
user@switch> show ethernet-switching table

Ethernet-switching table: 8 entries, 5 learned
  VLAN              MAC address       Type         Age Interfaces
  default           *                 Flood          - All-members
  default           00:00:05:00:00:01 Learn          - ge-0/0/10.0
  default           00:00:5e:00:01:09 Learn          - ge-0/0/13.0
  default           00:19:e2:50:63:e0 Learn          - ge-0/0/23.0
  sales             *                 Flood          - All-members
  sales             00:00:5e:00:07:09 Learn          - ge-0/0/0.0
  support           *                 Flood          - All-members
  support           00:00:5e:00:01:01 Learn          - ge-0/0/46.0
```

Meaning The output shows that learned entries for the **sales** and **support** VLANs have been added to the Ethernet switching table, and are associated with interfaces **ge-0/0/0.0** and **ge-0/0/46.0**. Even though the VLANs were associated with more than one interface in the configuration, these interfaces are the only ones that are currently operating.

Example: Connecting an Access Switch to a Distribution Switch

In large local area networks (LANs), you commonly need to aggregate traffic from a number of access switches into a distribution switch.

This example describes how to connect an access switch to a distribution switch:

Requirements

This example uses the following hardware and software components:

- For the distribution switch, one J-EX4200-24F switch. This model is designed to be used as a distribution switch for aggregation or collapsed core network topologies and in space-constrained data centers. It has twenty-four 1-Gigabit Ethernet fiber SFP ports and an uplink module with two 10-Gigabit Ethernet ports.
- For the access switch, one J-EX4200-24T, which has twenty-four 1-Gigabit Ethernet ports, 8 of which support Power over Ethernet (PoE), and an uplink module with four 1-Gigabit Ethernet ports.

Before you connect an access switch to a distribution switch, be sure you have:

- Installed the two switches. See Installing and Connecting a J-EX4200 Switch.
- Performed the initial software configuration on both switches. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.

Overview and Topology

In a large office that is spread across several floors or buildings, or in a data center, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect a single access switch to a distribution switch.

In the topology, the LAN is segmented into two VLANs, one for the sales department and the second for the support team. One 1-Gigabit Ethernet port on the access switch's uplink module connects to the distribution switch, to one 1-Gigabit Ethernet port on the distribution switch.

Figure 28 on page 1079 shows one J-EX4200 switch that is connected to the three access switches.

Figure 28: Topology for Configuration

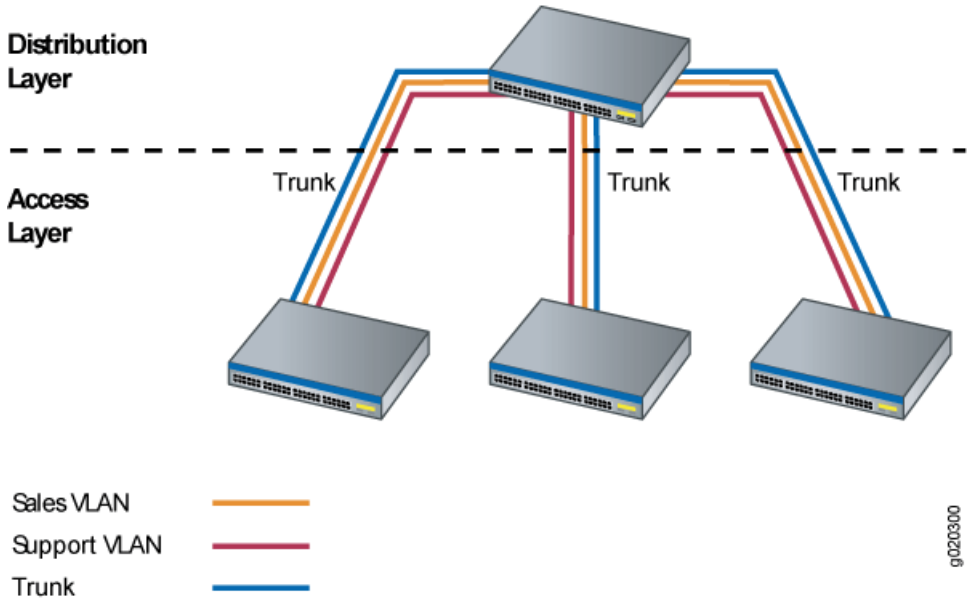

Table 144 on page 1079 explains the components of the example topology. The example shows how to configure one of the three access switches. The other access switches could be configured in the same manner.

Table 144: Components of the Topology for Connecting an Access Switch to a Distribution Switch

Property	Settings
Access switch hardware	J-EX4200-24T, 24 1-Gigabit Ethernet ports, with 8 ports PoE-enabled (**ge-0/0/0** through **ge-0/0/7**); one uplink module
Distribution switch hardware	J-EX4200-24F, 24 1-Gigabit Ethernet fiber SPF ports (**ge-0/0/0** through **ge-0/0/23**); one uplink module
VLAN names and tag IDs	**sales**, tag **100** **support**, tag **200**
VLAN subnets	**sales**: **192.0.2.0/25** (addresses **192.0.2.1** through **192.0.2.126**) **support**: **192.0.2.128/25** (addresses **192.0.2.129** through **192.0.2.254**)
Trunk port interfaces	On the access switch: **ge-0/1/0** On the distribution switch: **ge-0/0/0**
Access port interfaces in VLAN **sales** (on access switch)	Avaya IP telephones: **ge-0/0/2** through **ge-0/0/4** Wireless access point: **ge-0/0/0** Printers: **ge-0/0/22** and **ge-0/0/23** File servers: **ge-0/0/20** and **ge-0/0/21**

Table 144: Components of the Topology for Connecting an Access Switch to a Distribution Switch *(continued)*

Property	Settings
Access port interfaces in VLAN **support** (on access switch)	Avaya IP telephones: **ge-0/0/5** through **ge-0/0/7** Wireless access point: **ge-0/0/1** Printers: **ge-0/0/44** and **ge-0/0/45** File servers: **ge-0/0/46** and **ge-0/0/47**
Unused interfaces on access switch	**ge-0/0/8** through **ge-0/0/19** and **ge-0/0/24** through **ge-0/0/43**

Configuring the Access Switch

To configure the access switch:

CLI Quick Configuration

To quickly configure the access switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 description “Sales Wireless access point port”
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description “Sales phone port”
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description “Sales printer port”
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description “Sales file server port”
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/1 unit 0 description “Support wireless access point port”
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/6 unit 0 description “Support phone port”
set interfaces ge-0/0/6 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description “Support printer port”
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description “Support file server port”
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/1/0 unit 0 description “Uplink module port connection to distribution switch”
set interfaces ge-0/1/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/1/0 unit 0 family ethernet-switching native-vlan-id 1
set interfaces ge-0/1/0 unit 0 family ethernet switching vlan members [sales support]
set interfaces vlan unit 0 family inet address 192.0.2.1/25
set interfaces vlan unit 1 family inet address 192.0.2.129/25
set vlans sales interface ge-0/0/0.0
set vlans sales interface ge-0/0/3.0
set vlans sales interface ge-0/0/22.0
set vlans sales interface ge-0/0/20.0
set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans sales vlan-description “Sales VLAN”
set vlans support interface ge-0/0/1.0
set vlans support interface ge-0/0/6.0
set vlans support interface ge-0/0/44.0
set vlans support interface ge-0/0/46.0
set vlans support vlan-id 200
set vlans support l3–interface vlan.1
set vlans support vlan-description “Support VLAN”
```

Step-by-Step Procedure

To configure the access switch:

1. Configure the 1-Gigabit Ethernet interface on the uplink module to be the trunk port that connects to the distribution switch:

```
[edit interfaces ge-0/1/0 unit 0]
user@access-switch# set description “Uplink module port connection to distribution switch”
user@access-switch# set ethernet-switching port-mode trunk
```

2. Specify the VLANs to be aggregated on the trunk port:

```
[edit interfaces ge-0/1/0 unit 0]
user@access-switch# set ethernet-switching vlan members [ sales support ]
```

3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):

```
[edit interfaces ge-0/1/0 unit 0]
user@access-switch# set ethernet-switching native-vlan-id 1
```

4. Configure the sales VLAN:

```
[edit vlans sales]
user@access-switch# set vlan-description “Sales VLAN”
user@access-switch# set vlan-id 100
user@access-switch# set l3-interface vlan.0
```

5. Configure the support VLAN:

```
[edit vlans support]
user@access-switch# set vlan-description “Support VLAN”
user@access-switch# set vlan-id 200
user@access-switch# set l3-interface vlan.1
```

6. Create the subnet for the sales broadcast domain:

```
[edit interfaces]
user@access-switch# set vlan unit 0 family inet address 192.0.2.1/25
```

7. Create the subnet for the support broadcast domain:

```
[edit interfaces]
user@access-switch# set vlan unit 1 family inet address 192.0.2.129/25
```

8. Configure the interfaces in the sales VLAN:

```
[edit interfaces]
user@access-switch# set ge-0/0/0 unit 0 description “Sales wireless access point port”
user@access-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/3 unit 0 description “Sales phone port”
user@access-switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/20 unit 0 description “Sales file server port”
user@access–switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/22 unit 0 description “Sales printer port”
user@access-switch# set ge-0/0/22 unit 0 family ethernet-switching vlan members sales
```

9. Configure the interfaces in the support VLAN:

```
[edit interfaces]
user@access-switch# set ge-0/0/1 unit 0 description “Support wireless access point
port”
user@access-switch# set ge-0/0/1 unit 0 family ethernet-switching vlan members
support
user@access-switch# set ge-0/0/6 unit 0 description “Support phone port”
user@access-switch# set ge-0/0/6 unit 0 family ethernet-switching vlan members
support
user@access-switch# set ge-0/0/44 unit 0 description “Support printer port”
user@access-switch# set ge-0/0/44 unit 0 family ethernet-switching vlan members
support
user@access-switch# set ge-0/0/46 unit 0 description “Support file server port”
user@access-switch# set ge-0/0/46 unit 0 family ethernet-switching vlan members
support
```

10. Configure descriptions and VLAN tag IDs for the sales and support VLANs:

```
[edit vlans]
user@access-switch# set sales vlan-description “Sales VLAN”
user@access-switch# set sales vlan-id 100
user@access-switch# set support vlan-description “Support VLAN”
user@access-switch# set support vlan-id 200
```

11. To route traffic between the sales and support VLANs and associate a Layer 3 interface with each VLAN:

```
[edit vlans]
user@access-switch# set sales l3-interface vlan.0
user@access-switch# set support l3-interface vlan.1
```

Results Display the results of the configuration:

```
user@access-switch> show
interfaces {
  ge-0/0/0 {
    unit 0 {
      description “Sales wireless access point port”;
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      description “Sales phone port”;
        family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/20 {
    unit 0 {
      description “Sales file server port”;
        family ethernet-switching {
        vlan members sales;
      }
```

```
    }
  }
  ge-0/0/22 {
    unit 0 {
      description “Sales printer port”;
        family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/1 {
    unit 0 {
      description “Support wireless access point port”;
        family ethernet-switching {
        vlan members support;
      }
    }
  }
  ge-0/0/6 {
    unit 0 {
      description “Support phone port”;
        family ethernet-switching {
        vlan members support;
      }
    }
  }
  ge-0/0/44 {
    unit 0 {
      description “Support printer port”;
        family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/46 {
    unit 0 {
      description “Support file server port”;
        family ethernet-switching {
        vlan members support;
      }
    }
  }
  ge-0/1/0 {
    unit 0 {
      description “Uplink module port connection to distribution switch”;
        family ethernet-switching {
        port-mode trunk;
          vlan members [ sales support ];
        native-vlan-id 1;
      }
    }
  }
  vlan {
    unit 0 {
      family inet address 192.0.2.1/25;
    }
```

```
        unit 1 {
          family inet address 192.0.2.129/25;
        }
      }
    }
    vlans {
      sales {
        vlan-id 100;
        vlan-description “Sales VLAN”;
        l3-interface vlan.0;
      }
      support {
        vlan-id 200;
        vlan-description “Support VLAN”;
        l3-interface vlan.1;
      }
    }
```

TIP: To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

Configuring the Distribution Switch

To configure the distribution switch:

CLI Quick Configuration

To quickly configure the distribution switch, copy the following commands and paste them into the switch terminal window:

```
set interfaces ge-0/0/0 description “Connection to access switch”
set interfaces ge-0/0/0 ethernet-switching port-mode trunk
set interfaces ge-0/0/0 ethernet-switching vlan members [ sales support ]
set interfaces ge-0/0/0 ethernet-switching native-vlan-id 1
set interfaces vlan unit 0 family inet address 192.0.2.2/25
set interfaces vlan unit 1 family inet address 192.0.2.130/25
set vlans sales vlan-description “Sales VLAN”
set vlans sales vlan-id 100
set vlans sales l3-interface vlan.0
set vlans support vlan-description “Support VLAN”
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

Step-by-Step Procedure

To configure the distribution switch:

1. Configure the interface on the switch to be the trunk port that connects to the access switch:

   ```
   [edit interfaces ge-0/0/0 unit 0]
   user@distribution-switch# set description “Connection to access switch”
   user@distribution-switch# set ethernet-switching port-mode trunk
   ```

2. Specify the VLANs to be aggregated on the trunk port:

   ```
   [edit interfaces ge-0/0/0 unit 0]
   user@distribution-switch# set ethernet-switching vlan members [ sales support ]
   ```

3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):

```
[edit interfaces]
user@distribution-switch# set ge-0/0/0 ethernet-switching native-vlan-id 1
```

4. Configure the sales VLAN:

```
[edit vlans sales]
user@distribution-switch# set vlan-description “Sales VLAN”
user@distribution-switch# set vlan-id 100
user@distribution-switch# set l3-interface vlan.0
```

5. Configure the support VLAN:

```
[edit vlans support]
user@distribution-switch# set vlan-description “Support VLAN”
user@distribution-switch# set vlan-id 200
user@distribution-switch# set l3-interface vlan.1
```

6. Create the subnet for the sales broadcast domain:

```
[edit interfaces]
user@distribution-switch# set vlan unit 0 family inet address 192.0.2.2/25
```

7. Create the subnet for the support broadcast domain:

```
[edit interfaces]
user@distribution-switch# set vlan unit 1 family inet address 192.0.2.130/25
```

Results Display the results of the configuration:

```
user@distribution-switch> show
interfaces {
    ge-0/0/0 {
        description “Connection to access switch”;
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
                vlan members [ sales support ];
                native-vlan-id 1;
            }
        }
    }
    vlan {
        unit 0 {
            family inet address 192.0.2.2/25;
        }
        unit 1 {
            family inet address 192.0.2.130/25;
        }
    }
}
vlans {
    sales {
        vlan-id 100;
        vlan-description “Sales VLAN”;
        l3-interface vlan.0;
    }
```

```
    support {
      vlan-id 200;
      vlan-description “Support VLAN”;
      l3-interface vlan.1;
    }
  }
```

TIP: To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the VLAN Members and Interfaces on the Access Switch on page 1086
- Verifying the VLAN Members and Interfaces on the Distribution Switch on page 1087

Verifying the VLAN Members and Interfaces on the Access Switch

Purpose Verify that the **sales** and **support** have been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans

Name            Tag     Interfaces
default
                        ge-0/0/1.0, ge-0/0/2.0, ge-0/0/4.0, ge-0/0/5.0,
                        ge-0/0/6.0, ge-0/0/7.0, ge-0/0/8.0*, ge-0/0/9.0,

                        ge-0/0/10.0, ge-0/0/11.0*, ge-0/0/12.0, ge-0/0/13.0,
                        ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0, ge-0/0/17.0,
                        ge-0/0/18.0, ge-0/0/19.0*,ge-0/0/21.0, ge-0/0/23.0,
                        ge-0/0/25.0, ge-0/0/27.0*,ge-0/0/28.0, ge-0/0/29.0,
                        ge-0/0/30.0, ge-0/0/31.0*,ge-0/0/32.0, ge-0/0/33.0,
                        ge-0/0/34.0, ge-0/0/35.0*,ge-0/0/36.0, ge-0/0/37.0,
                        ge-0/0/38.0, ge-0/0/39.0*,ge-0/0/40.0, ge-0/0/41.0,
                        ge-0/0/42.0, ge-0/0/43.0*,ge-0/0/45.0, ge-0/0/47.0,
                        ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0*

sales           100
                        ge-0/0/0.0*, ge-0/0/3.0, ge-0/0/20.0, ge-0/0/22.0,
                        ge-0/1/0.0*,

support         200
                        ge-0/0/1.0*, ge-0/0/6.0, ge-0/0/44.0, ge-0/0/46.0,

mgmt
                        me0.0*
```

Meaning The output shows the **sales** and **support** VLANs and the interfaces associated with them.

Verifying the VLAN Members and Interfaces on the Distribution Switch

Purpose Verify that the **sales** and **support** have been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans

Name            Tag     Interfaces
default
                        ge-0/0/1.0, ge-0/0/2.0, ge-0/0/3.0, ge-0/0/4.0,
                        ge-0/0/5.0, ge-0/0/6.0, ge-0/0/7.0*, ge-0/0/8.0,

                        ge-0/0/9.0, ge-0/0/10.0*, ge-0/0/11.0, ge-0/0/12.0,
                        ge-0/0/13.0, ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0,
                        ge-0/0/17.0, ge-0/0/18.0*, ge-0/0/19.0, ge-0/0/20.0,
                        ge-0/0/21.0, ge-0/0/22.0*, ge-0/0/23.0, ge-0/1/1.0*,
                        ge-0/1/2.0*, ge-0/1/3.0*

sales           100
                        ge-0/0/0.0*

support         200
                        ge-0/0/0.0*

mgmt
                        me0.0*
```

Meaning The output shows the **sales** and **support** VLANs associated to interface **ge-0/0/0.0**. Interface **ge-0/0/0.0** is the trunk interface connected to the access switch.

Example: Configure Automatic VLAN Administration Using GVRP

As a network expands and the number of clients and VLANs increases, VLAN administration becomes complex, and the task of efficiently configuring VLANs on multiple J-EX Series switches becomes increasingly difficult. To automate VLAN administration, you can enable GARP VLAN Registration Protocol (GVRP) on the network.

NOTE: Only trunk interfaces can be enabled for GVRP.

This example describes how to use GVRP to automate administration of VLAN membership changes within your network:

Requirements

This example uses the following hardware and software components:

- Two J-EX4200 access switches
- One J-EX4200 distribution switch

Before you configure GVRP on the access switches and on the distribution switch, be sure you have:

- Performed the initial software configuration on the switches. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.
- Configured the VLANs on both the access switches and on the distribution switch. (Dynamic VLAN configuration is not supported.)
- Configured a trunk interface on all the switches.

Overview and Topology

When you are setting up your network, you should configure all VLANs on all switches, even though some switches are not actively participating in a VLAN. Then enable GVRP on the trunk interface of each switch. GVRP ensures that the VLAN membership information on the trunk interface is updated as the switch’s access interfaces become active or inactive in the configured VLANs.

You do not need to take an extra step of explicitly binding a VLAN to the trunk interface. When GVRP is enabled, the trunk interface advertises all the VLANs that are active (bound to access interfaces) on that switch. A GVRP-enabled trunk interface does not advertise VLANs that have been configured on the switch but that are not currently bound to an access interface. Thus, GVRP provides the benefit of reducing network overhead—by limiting the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.

This example shows a network with three VLANs: finance, sales, and lab.

Access Switch A has been configured to support all three VLANS and all three VLANS are active, bound to interfaces that are connected to personal computers:

- **ge-0/0/1**—Connects PC1 as member of finance vlan, VLAN ID 100
- **ge-0/0/2**—Connects PC2 as member of lab vlan, VLAN ID 200

- **ge-0/0/3**—Connects PC3 as member of sales vlan, VLAN ID 300

Access Switch B has also been configured to support three VLANS. However, currently only two VLANs are active, bound to interfaces that are connected to personal computers:

- **ge-0/0/0**—Connects PC4 as member of finance vlan, VLAN ID 100
- **ge-0/0/1**—Connects PC5 as member of lab vlan, VLAN ID 200

The Distribution Switch is also configured to support the three VLANs (finance, lab, sales). However, the Distribution Switch does not have any access interfaces that are connecting devices as members of these VLANs. The Distribution Switch has two trunk interfaces:

- **xe-0/1/1**—Connects Distribution Switch to Access Switch A.
- **xe-0/1/0**—Connects Distribution Switch to Access Switch B.

Figure 29 on page 1089 shows GVRP configured on two access switches and one distribution switch.

Figure 29: GVRP Configured on Two Access Switches and One Distribution Switch for Automatic VLAN Administration

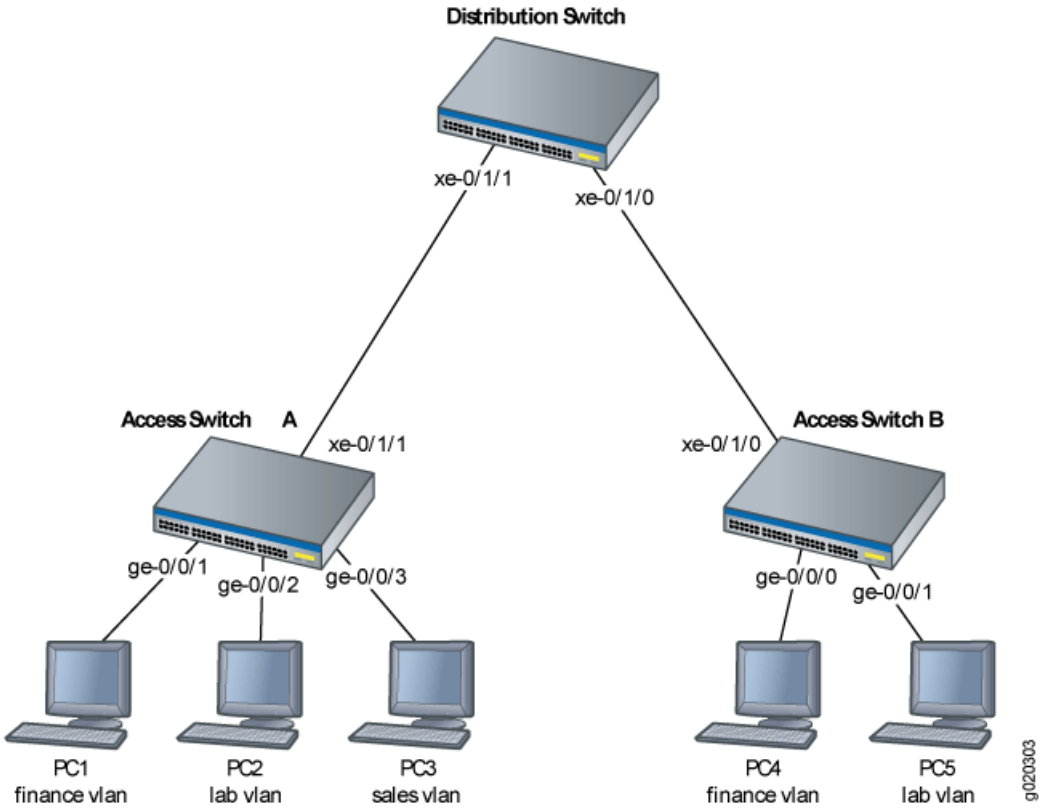

Table 145: Components of the Network Topology

Property	Settings
Switch hardware	• Access Switch A • Access Switch B • Distribution Switch
VLAN names and tag IDs	**finance**, tag **100** **lab**, tag **200** **sales**, tag **300**
Interfaces	Access Switch A Interfaces • **ge-0/0/1**—Connects PC1 to Access Switch A. • **ge-0/0/2**—Connects PC2 to Access Switch A. • **ge-0/0/3**—Connects PC3 to Access Switch A. • **xe-0/1/1**—Connects Access Switch A to Distribution Switch. (trunk) Access Switch B Interfaces • **ge-0/0/0**—Connects PC4 to Access Switch B. • **ge-0/0/1**—Connects PC5 to Access Switch B. • **xe-0/1/0**—Connects Access Switch B to Distribution Switch. (trunk) Distribution Switch Interfaces • **xe-0/1/1**—Connects Distribution Switch to Access Switch A. (trunk) • **xe-0/1/0**—Connects Distribution Switch to Access Switch B. (trunk)

When VLAN access interfaces become active or inactive, GVRP ensures that the updated information is advertised on the trunk interface. Thus, the Distribution Switch does not forward traffic to inactive VLANs.

Configuring VLANs and GVRP on Access Switch A

To configure three VLANs on the switch, bind access interfaces for PC1, PC2, and PC3 to the VLANs (finance, lab, sales), and enable GVRP on the trunk interface of Access Switch A, perform these tasks:

CLI Quick Configuration

To quickly configure Access Switch A to support the three VLANs, bind interfaces for the three PCs to the appropriate VLANs, and enable GVRP on the trunk interface, copy the following commands and paste them into the switch terminal window of Switch A:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members finance
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members lab
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/1/1 unit 0 family ethernet-switching port-mode trunk
```

```
set protocols gvrp interface xe-0/1/1.0
```

NOTE: As we recommend, default GVRP timers are used in this example. The default values associated with each GVRP timer are: 200 ms for the join timer, 600 ms for the leave timer, and 1000 cs (10000 ms) for the leaveall timer. Modifying timers to inappropriate values may cause an imbalance in the operation of GVRP. Refer to IEEE 802.1D [2004] Clause 12 for more information. The timer values are displayed when you use the **show gvrp** command to verify that GVRP is enabled. For more information on the timers, see **gvrp** and its associated configuration statements.

Step-by-Step Procedure

To configure Access Switch A to support the three VLANs, bind interfaces for the three PCs to the appropriate VLANs, and enable GVRP on the trunk interface, copy the following commands and paste them into the switch terminal window of Switch A:

1. Configure the finance VLAN:

```
[edit]
user@Access-Switch-A# set vlans finance vlan-id 100
```

2. Configure the lab VLAN:

```
[edit]
user@Access-Switch-A# set vlans lab vlan–id 200
```

3. Configure the sales VLAN:

```
[edit]
user@Access-Switch-A# set vlans sales vlan–id 300
```

4. Configure an Ethernet interface as a member of the finance VLAN:

```
[edit]
does user@Access-Switch-A# set interfaces ge-0/0/1 unit 0 family ethernet-switching
vlan members finance
```

5. Configure an Ethernet interface as a member of the lab VLAN:

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan
members lab
```

6. Configure an Ethernet interface as a member of the sales VLAN:

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan
members sales
```

7. Configure a trunk interface:

```
user@Access-Switch-A# set interfaces xe-0/1/1 unit 0 family ethernet-switching
port-mode trunk
```

8. Enable GVRP on the trunk interface:

```
[edit]
user@Access-Switch-A# set protocols gvrp interface xe-0/1/1.0
```

Results Check the results of the configuration:

```
interfaces {
    ge-0/0/0 {
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/1 {
        unit 0 {
            family ethernet-switching {
                vlan {
                    members finance;
                }
            }
        }
    }
    ge-0/0/2 {
        unit 0 {
            family ethernet-switching {
                vlan {
                    members lab;
                }
            }
        }
    }
    ge-0/0/3 {
        unit 0 {
            family ethernet-switching {
                vlan {
                    members sales;
                }
            }
        }
    }
    xe-0/1/1 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
            }
        }
    }
    ge-0/1/2 {
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/1/3 {
        unit 0 {
            family ethernet-switching;
        }
    }
}

    finance {
      vlan-id 100;
    }
    lab {
      vlan-id 200;
    }
    sales {
      vlan-id 300;
    }
```

Configuring VLANs and GVRP on Access Switch B

To configure three VLANs on the switch, bind access interfaces for PC4 and PC5 to the VLANs (finance and lab), and enable GVRP on the trunk interface of Access Switch Switch B, perform these tasks:

CLI Quick Configuration

To quickly configure Access Switch B to support the three VLANs, bind interfaces for the two PCs to the appropriate VLANs, and enable GVRP on the trunk interface, copy the following commands and paste them into the switch terminal window of Switch B:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members finance
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members lab
set interfaces xe-0/1/0 unit 0 family ethernet-switching port-mode trunk
set protocols gvrp interface xe-0/1/0.0
```

Step-by-Step Procedure

To configure Access Switch B to support the three VLANs, bind interfaces for the two PCs to the appropriate VLAN, and enable GVRP on the trunk interface, copy the following commands and paste them into the switch terminal window of Switch B:

1. Configure the finance VLAN:

```
[edit]
user@Access-Switch-B# set vlans finance vlan-id 100
```

2. Configure the lab VLAN:

```
[edit]
user@Access-Switch-B# set vlans lab vlan–id 200
```

3. Configure the sales VLAN:

```
[edit]
user@Access-Switch-B# set vlans sales vlan–id 300
```

4. Configure an Ethernet interface as a member of the finance VLAN:

```
[edit]
user@Access-Switch-B# set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan
members finance
```

5. Configure an Ethernet interface as a member of the lab VLAN:

```
[edit]
user@Access-Switch-B# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan
members lab
```

6. Configure a trunk interface:

```
user@Access-Switch-B# set interfaces xe-0/1/0 unit 0 family ethernet-switching
port-mode trunk
```

7. Enable GVRP on the trunk interface:

```
[edit]
user@Access-Switch-B# set protocols gvrp xe-0/1/0.0
```

NOTE: As we recommend, default GVRP timers are used in this example. The default values associated with each GVRP timer are: 200 ms for the join timer, 600 ms for the leave timer, and 1000 cs (10000 ms) for the leaveall timer. Modifying timers to inappropriate values might cause an imbalance in the operation of GVRP. Refer to IEEE 802.1D [2004] Clause 12 for more information. The timer values are displayed when you use the show gvrp command to verify that GVRP is enabled. For more information on the timers, see gvrp and its associated configuration statements.

Results

Check the results of the configuration:

```
[edit]
  user@Access-Switch-B #show
interfaces {
```

```

        }
        lldp-med {
            interface all;
        }
        gvrp {
            interface xe-0/1/0.0;
        }
        rstp;
    }
    ethernet-switching-options {
        storm-control {
            interface all {
                level 50;
            }
        }
    }
    vlans {
        finance {
            vlan-id 100;
        }
        lab {
            vlan-id 200;
        }
        sales {
            vlan-id 300;
        }
    }
```

Configuring VLANS and GVRP on the Distribution Switch

CLI Quick Configuration

To quickly configure the **finance**, **lab**, and **sales** VLANs on the Distribution Switch and to enable GVRP on the trunk interface of the Distribution Switch, copy the following commands and paste them into the switch terminal window of the Distribution Switch:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces xe-0/1/1 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/1/0 unit 0 family ethernet-switching port-mode trunk
set protocols gvrp interface xe-0/1/1.0
set protocols gvrp interface xe-0/1/0.0
```

Step-by-Step Procedure

To configure the three VLANs on the Distribution Switch, to configure the trunk interfaces, and to enable GVRP on the trunk interface of the Distribution Switch:

1. Configure the finance VLAN:

```
[edit]
user@Distribution-Switch# set vlans finance vlan–id 100
```

2. Configure the lab VLAN:

```
[edit]
user@Distribution-Switch# set vlans lab vlan–id 200
```

3. Configure the sales VLAN:

```
[edit]
user@Distribution-Switch# set vlans sales vlan–id 300
```

4. Configure the trunk interface to Access Switch A:

```
[edit]
user@Distribution-Switch# set interfaces xe-0/1/1 unit 0 familyethernet-switching
port-mode trunk
```

5. Configure the trunk interface to Access Switch B:

```
[edit]
user@Distribution-Switch# set interfaces xe-0/1/0 unit 0 family ethernet-switching
port-mode trunk
```

6. Enable GVRP on the trunk interface for **xe-0/1/1** :

```
[edit]
user@Distribution-Switch# set protocols gvrp interface xe-0/1/1.0
```

7. Enable GVRP on the trunk interface for **xe-0/1/0** :

```
[edit]
user@Distribution-Switch# set protocols gvrp interface xe-0/1/0.0
```

Results

Display the results of the configuration:

```
[edit]
  user@Distribution Switch-D #show
interfaces {
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching;
    }
  }
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching;
    }
  }
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching;
    }
  }
```

```
    ge-0/0/3 {
        unit 0 {
            family ethernet-switching;
        }
    }
    xe-0/1/0 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
            }
        }
    }
    ge-0/1/1 {
        unit 0 {
            family ethernet-switching;
        }
    }
    xe-0/1/1 {
        unit 0 {
            family ethernet-switching {
                port-mode trunk;
            }
        }
    }
    ge-0/1/2 {
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/1/3 {
        unit 0 {
            family ethernet-switching;
        }
    }
}
    protocols {
        igmp-snooping {
            vlan all;
        }
        lldp {
            interface all;
        }
        lldp-med {
            interface all;
        }
        gvrp {
            interface xe-0/1/0.0;
            interface xe-0/1/1.0;
        }
        rstp;
    }
    ethernet-switching-options {
        storm-control {
            interface all {
                level 50;
            }
```

```
    }
  }
  vlans {
    finance {
      vlan-id 100;
    }
    lab {
      vlan-id 300;
    }
    sales {
      vlan-id 300;
    }
  }
```

Verification

To confirm that the configuration is updating VLAN membership, perform these tasks:

- Verifying That GVRP Is Enabled on Access Switch A on page 1099
- Verifying That GVRP Is Updating VLAN Membership on Switch A on page 1099
- Verifying That GVRP Is Enabled on Access Switch B on page 1100
- Verifying That GVRP Is Updating VLAN Membership on Switch B on page 1100
- Verifying That GVRP Is Enabled on the Distribution Switch on page 1100
- Verifying That GVRP Is Updating VLAN Membership on the Distribution Switch on page 1101

Verifying That GVRP Is Enabled on Access Switch A

Purpose Verify that GVRP is enabled on the switch.

Action Show the GVRP configuration, using the **show gvrp** command:

```
user@Access-Switch-A> show gvrp

Global GVRP configuration
  GVRP status  : Enabled
  GVRP Timers (ms)
    Join       : 200
    Leave      : 600
    LeaveAll   : 10000
Interface Name      Protocol Status
--------------      ---------------
xe-0/1/1.0          Enabled
```

Meaning The results show that GVRP is enabled on the trunk interface of Switch A and that the default timers are used.

Verifying That GVRP Is Updating VLAN Membership on Switch A

Purpose To verify that GVRP is updating VLAN membership, display the Ethernet switching interfaces and associated VLANs that are active on switch A:

Action List Ethernet switching interfaces on the switch, using the **show ethernet-switching interfaces** command:

```
user@Access-Switch-A> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/1.0  up       finance                unblocked
ge-0/0/2.0  up       lab                    unblocked
ge-0/0/3.0  up       sales                  unblocked
xe-0/1/1.0  up       finance                unblocked
                     lab                    unblocked
```

Meaning GVRP has automatically added **finance** and **lab** as VLAN members on the trunk interface, because they are being advertised by Access Switch B.

Verifying That GVRP Is Enabled on Access Switch B

Purpose Verify that GVRP is enabled on the switch.

Action Show the GVRP configuration:

```
user@Access-Switch-B> show gvrp

Global GVRP configuration
  GVRP status  : Enabled
  GVRP Timers (ms)
    Join       : 200
    Leave      : 600
    LeaveAll   : 10000
Interface Name      Protocol Status
--------------      ---------------
xe-0/1/0.0          Enabled
```

Meaning The results show that GVRP is enabled on the trunk interface of Switch B and that the default timers are used.

Verifying That GVRP Is Updating VLAN Membership on Switch B

Purpose To verify that GVRP is updating VLAN membership, display the Ethernet switching interfaces and associated VLANs that are active on switch B:

Action List Ethernet switching interfaces on the switch:

```
user@Access-Switch-B> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  up       finance                unblocked
ge-0/0/1.0  up       lab                    unblocked
xe-0/1/1.0  up       finance                unblocked
                     lab                    unblocked
                     sales                  unblocked
```

Meaning GVRP has automatically added **finance**, **lab**, and **sales** as VLAN members on the trunk interface because they are being advertised by Access Switch A.

Verifying That GVRP Is Enabled on the Distribution Switch

Purpose Verify that GVRP is enabled on the switch.

Action Show the GVRP configuration:

```
user@Distribution-Switch> show gvrp

Global GVRP configuration
  GVRP status  : Enabled
  GVRP Timers (ms)
    Join       : 200
    Leave      : 600
    LeaveAll   : 10000
Interface Name      Protocol Status
--------------      ---------------
xe-0/1/0.0          Enabled
xe-0/1/1.0          Enabled
```

Verifying That GVRP Is Updating VLAN Membership on the Distribution Switch

Purpose To verify that GVRP is updating VLAN membership on the distribution switch, display the Ethernet switching interfaces and associated VLANs on the Distribution Switch:

Action List the Ethernet switching interfaces on the switch:

```
user@Distribution-Switch> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
xe-0/1/1.0  up       finance                unblocked
                     lab                    unblocked
                     sales                  unblocked
xe-0/1/0.0  up       finance                unblocked
                     lab                    unblocked
```

Meaning The Distribution Switch has two trunk interfaces. Interface **xe-0/1/1.0** connects the Distribution Switch to Access Switch A and is therefore updated to show that it is a member of all the VLANs that are active on Access Switch A. Any traffic for those VLANs will be passed on from the Distribution Switch to Access Switch A, through interface **xe-0/1/1.0**. Interface **xe-0/1/0.0** connects the Distribution Switch to Access Switch B and is updated to show that it is a member of the two VLANs that are active on Access Switch B. Thus, the Distribution Switch sends traffic for **finance** and **lab** to both Access Switch A and Access Switch B. But the Distribution Switch sends traffic for **sales** only to Access Switch A.

Related Documentation

- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 1063
- Understanding Bridging and VLANs on J-EX Series Switches on page 1041

Example: Configuring Redundant Trunk Links for Faster Recovery

Simplify the convergence configuration in a typical enterprise network by configuring a primary link and a secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over without waiting for normal STP convergence.

This example describes how to create a redundant trunk group:

- Requirements on page 1102
- Overview and Topology on page 1102

Requirements

This example uses the following hardware and software components:

- Two J-EX4200 distribution switches
- One J-EX4200 access switch

Before you configure the redundant trunk links network on the access and distribution switches, be sure you have:

- Installed the access switch. See Installing and Connecting a J-EX4200 Switch.
- Installed the two distribution switches. See Installing and Connecting a J-EX4200 Switch.
- Performed the initial switch configuration. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.

Overview and Topology

This example shows a simple configuration to illustrate the basic steps for creating a redundant trunk group.

Configuring redundant trunk links places the primary link and the secondary link in a redundant group. However, a primary link need not be configured. If a primary link is not specified, the software compares the two links and selects the link with the highest port number as the active link. For example, if the two interfaces are **ge-0/1/0** and **ge-0/1/1**, the software assigns **ge-0/1/1** as the active link..

Whether a primary link is specified as the active link, or whether it is calculated by the software, traffic is handled in the same manner. Traffic passes through the active link but is blocked on the secondary link. If the active link goes down or is disabled administratively, the secondary link becomes active and begins forwarding traffic. However, there is a difference between the behavior of a primary, active link and an active link that is calculated to be active by the software. If an active link goes down, the secondary link begins forwarding traffic. If the old, active link comes up again, the following occurs:

- If the old, active link was configured as the primary link, then it resumes the role of active link and the other link is blocked. An interface configured as primary continues to carry with it the primary role whenever it becomes active.
- If no primary link was configured, and the active link was calculated by the software when the redundant group was formed, then the old, active link will not preempt the other interface (new active).

NOTE: The Junos OS for J-EX Series switches does not allow an interface to be in a redundant trunk group and in an STP topology at the same time.

Figure 30 on page 1103 displays an example topology containing three switches. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk ports **ge-0/0/9.0** (Link 1) and **ge-0/0/10.0** (Link 2).

Table 146 on page 1103 lists the components used in this redundant trunk group.

Figure 30: Topology for Configuring the Redundant Trunk Links

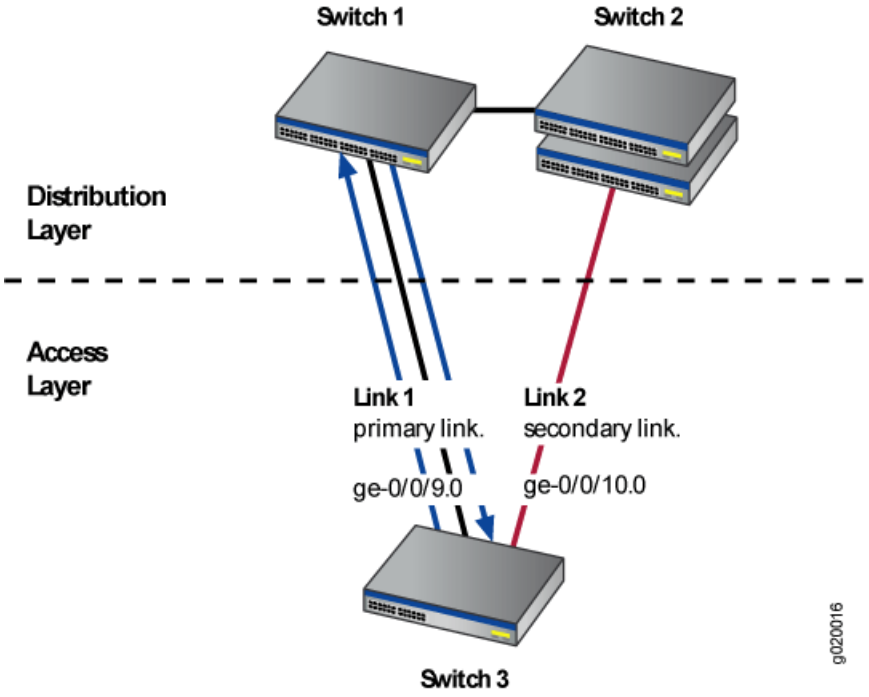

Table 146: Components of the Redundant Trunk Link Topology

Property	Settings
Switch hardware	• Switch 1–1 J-EX4200 distribution switch • Switch 2–1 J-EX4200 distribution switch • Switch 3–1 J-EX4200 access switch
Trunk port interfaces	On Switch 3 (access switch): **ge-0/0/9.0** and **ge-0/0/10.0**
Redundant trunk group	**group1**

This configuration example creates a redundant trunk group called **group1** on Switch 3. The trunk ports **ge-0/0/9.0** and **ge-0/0/10.0** are the two links in **group1**. The trunk port **ge-0/0/9.0** will be configured administratively as the primary link. The trunk port **ge-0/0/10.0** will be the secondary link.

Configuration

CLI Quick Configuration

To quickly configure the redundant trunk group **group1** on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set ethernet-switching-options redundant-trunk-group group-name group1
set ethernet-switching-options redundant-trunk-group group-name group1 interface ge-0/0/9.0
primary
set ethernet-switching-options redundant-trunk-group group-name group1 interface ge-0/0/10.0
```

Step-by-Step Procedure

Configure the redundant trunk group **group1** on Switch 3 and specify the primary and secondary links.

1. Configure the redundant trunk group **group1**:

   ```
   [edit ethernet-switching-options]
   user@switch# set redundant-trunk-group group-name group1
   ```

2. Configure the trunk port **ge-0/0/9.0** as the primary link and **ge-0/0/10** as the secondary link:

   ```
   [edit ethernet-switching-options]
   user@switch# set redundant-trunk-group group-name group1 interface ge-0/0/9.0
   primary
   user@switch# set redundant-trunk-group group-name group1 interface ge-0/0/10.0
   ```

Results

Display the results of the configuration:

```
user@switch# show
  ethernet-switching-options {
    redundant-trunk-group {
      group-name group1 {
        interface ge-0/0/9.0 primary;
        interface ge-0/0/10.0;
      }
    }
  }
}
```

Verification

Verify that the redundant trunk group **group1** has been created and is operating properly:

- Verifying That the Redundant Group Has Been Created on page 1104

Verifying That the Redundant Group Has Been Created

Purpose

Verify that the redundant trunk group **group1** has been created on the switch and that trunk ports are members of the redundant trunk group.

Action

List all redundant trunk groups configured on the switch:

```
user@switch> show redundant-trunk-group group1
Redundant-trunk-group: group1
Interfaces           : ge-0/0/9.0  (P) , DOWN
                     : ge-0/0/10.0 (A) , UP
Bandwidth            : 1000 Mbps, 1000 Mbps
Last Time of Flap    : 1970-01-01 00:19:12 UTC (00:00:06 ago), Never
#Flaps               : 1, 0
```

Meaning The **show redundant-trunk-group** command lists all redundant trunk groups configured on the switch and which trunk links are members of the group. For this configuration example, the output shows that the redundant trunk group **group1** is configured on the switch. The **(P)** beside trunk port **ge-0/0/9.0** indicates that it is configured as the primary link. The **(A)** beside the **ge-0/0/10.0** trunk port indicates that it is the active link.

Example: Setting Up Q-in-Q Tunneling on J-EX Series Switches

Service providers can use Q-in-Q tunneling to transparently pass Layer 2 VLAN traffic from a customer site, through the service provider network, to another customer site without removing or changing the customer VLAN tags or class-of-service (CoS) settings. You can configure Q-in-Q tunneling on J-EX Series switches.

This example describes how to set up Q-in-Q:

Requirements

This example requires one J-EX Series switch.

Before you begin setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 1136 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 1133.

Overview and Topology

In this service provider network, there are multiple customer VLANs mapped to one service VLAN.

Table 147 on page 1105 lists the settings for the example topology.

Table 147: Components of the Topology for Setting Up Q-in-Q Tunneling

Interface	Description
ge-0/0/11.0	Tagged S-VLAN trunk port
ge-0/0/12.0	Untagged customer-facing access port
ge-0/0/13.0	Untagged customer-facing access port
ge-0/0/14.0	Tagged S-VLAN trunk port

Configuration

CLI Quick Configuration

To quickly create and configure Q-in-Q tunneling, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans qinqvlan vlan-id 4001
set vlans qinqvlan dot1q-tunneling customer-vlans 1-100
set vlans qinqvlan dot1q-tunneling customer-vlans 201-300
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members 4001
set interfaces ge-0/0/12 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/12 unit 0 family ethernet-switching vlan members 4001
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members 4001
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/14 unit 0 family ethernet-switching vlan members 4001
set ethernet-switching-options dot1q-tunneling ether-type 0x9100
```

Step-by-Step Procedure

To configure Q-in-Q tunneling:

1. Set the VLAN ID for the S-VLAN:

```
[edit vlans]
user@switch# set qinqvlan vlan-id 4001
```

2. Enable Q-in-Q tuennling and specify the customer VLAN ranges:

```
[edit vlans]
user@switch# set qinqvlan dot1q-tunneling customer-vlans 1-100
user@switch# set qinqvlan dot1q-tunneling customer-vlans 201-300
```

3. Set the port mode and VLAN information for the interfaces:

```
[edit interfaces]
user@switch# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/11 unit 0 family ethernet-switching vlan members 4001
user@switch# set ge-0/0/12 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/12 unit 0 family ethernet-switching vlan members 4001
user@switch# set ge-0/0/13 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/13 unit 0 family ethernet-switching vlan members 4001
user@switch# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/14 unit 0 family ethernet-switching vlan members 4001
```

4. Set the Q-in-Q Ethertype value:

```
[edit]
user@switch# set ethernet-switching-options dot1q-tunneling ether-type 0x9100
```

Results

Check the results of the configuration:

```
user@switch> show configuration vlans qinqvlan
vlan-id 4001;
   dot1q-tunneling {
   customer-vlans [ 1-100 201-300 ];
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That Q-in-Q Tunneling Was Enabled on page 1107

Verifying That Q-in-Q Tunneling Was Enabled

Purpose Verify that Q-in-Q tunneling was properly enabled on the switch.

Action Use the **show vlans** command:

```
user@switch> show vlans qinqvlan extensive
VLAN: qinqvlan, Created at: Thu Sep 18 07:17:53 2008
802.1Q Tag: 4001, Internal index: 18, Admin State: Enabled, Origin: Static
Dot1q Tunneling Status: Enabled
Customer VLAN ranges:
                     1-100
                     201-300
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged  4 (Active = 0)
      ge-0/0/11.0, tagged, trunk
      ge-0/0/14.0, tagged, trunk
      ge-0/0/12.0, untagged, access
      ge-0/0/13.0, untagged, access
```

Meaning The output indicates that Q-in-Q tunneling is enabled and that the VLAN is tagged and shows the associated customer VLANs.

Related Documentation

- Configuring Q-in-Q Tunneling (CLI Procedure) on page 1144

Example: Configuring a Private VLAN on a J-EX Series Switch

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature on J-EX Series switches allow an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN.

This example describes how to create a private VLAN primary VLAN and secondary VLANs:

NOTE: Configuring a voice over IP (VoIP) VLAN on PVLAN interfaces is not supported.

- Requirements on page 1108
- Overview and Topology on page 1108
- Configuration on page 1108
- Verification on page 1110

Requirements

This example requires one J-EX Series switch.

Before you begin configuring a private VLAN, make sure you have created and configured the necessary VLAN. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 1136 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 1133.

Overview and Topology

In a large office with multiple buildings and VLANs, you might need to isolate some workgroups or other endpoints for security reasons or to partition the broadcast domain. This configuration example shows a simple topology to illustrate how to create a private VLAN with one primary VLAN and two community VLANs, one for HR and one for finance, as well as two isolated ports for the mail server and the backup server.

Table 148 on page 1108 lists the settings for the example topology.

Table 148: Components of the Topology for Configuring a Private VLAN

Interface	Description
ge-0/0/0.0	Primary VLAN (**pvlan**) trunk interface
ge-0/0/11.0	User 1, HR Community (**hr-comm**)
ge-0/0/12.0	User 2, HR Community (**hr-comm**)
ge-0/0/13.0	User 3, Finance Community (**finance-comm**)
ge-0/0/14.0	User 4, Finance Community (**finance-comm**)
ge-0/0/15.0	Mail server, Isolated (**isolated**)
ge-0/0/16.0	Backup server, Isolated (**isolated**)
ge-1/0/0.0	Primary VLAN (**pvlan**) trunk interface

Configuration

CLI Quick Configuration

To quickly create and configure a private VLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans pvlan vlan-id 1000
set interfaces ge-0/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members pvlan
set interfaces ge-1/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-1/0/0 unit 0 family ethernet-switching vlan members pvlan
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/12 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode access
```

```
set interfaces ge-0/0/15 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/16 unit 0 family ethernet-switching port-mode access
set vlans pvlan no-local-switching
set vlans pvlan interface ge-0/0/0.0
set vlans pvlan interface ge-1/0/0.0
set vlans hr-comm interface ge-0/0/11.0
set vlans hr-comm interface ge-0/0/12.0
set vlans finance-comm interface ge-0/0/13.0
set vlans finance-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan
set vlans finance-comm primary-vlan pvlan
```

Step-by-Step Procedure

To configure the private VLAN:

1. Set the VLAN ID for the primary VLAN:

```
[edit vlans]
user@switch# set pvlan vlan-id 1000
```

2. Set the interfaces and port modes:

```
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching port-mode trunk

user@switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members pvlan

user@switch# set ge-1/0/0 unit 0 family ethernet-switching port-mode trunk

user@switch# set ge-1/0/0 unit 0 family ethernet-switching vlan members pvlan

user@switch# set ge-0/0/11 unit 0 family ethernet-switching port-mode access

user@switch# set ge-0/0/12 unit 0 family ethernet-switching port-mode access

user@switch# set ge-0/0/13 unit 0 family ethernet-switching port-mode access

user@switch# set ge-0/0/14 unit 0 family ethernet-switching port-mode access

user@switch# set ge-0/0/15 unit 0 family ethernet-switching port-mode access

user@switch# set ge-0/0/16 unit 0 family ethernet-switching port-mode access
```

3. Set the primary VLAN to have no local switching:

NOTE: The primary VLAN must be a tagged VLAN.

```
[edit vlans]
user@switch# set pvlan no-local-switching
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
user@switch# set pvlan interface ge-0/0/0.0

user@switch# set pvlan interface ge-1/0/0.0
```

5. For each secondary VLAN, configure access interfaces:

NOTE: The secondary VLANs must be untagged VLANs.

```
[edit vlans]
user@switch# set hr-comm interface ge-0/0/11.0

user@switch# set hr-comm interface ge-0/0/12.0

user@switch# set finance-comm interface ge-0/0/13.0

user@switch# set finance-comm interface ge-0/0/14.0
```

6. For each community VLAN, set the primary VLAN:

```
[edit vlans]
user@switch# set hr-comm primary-vlan pvlan

user@switch# set finance-comm primary-vlan pvlan
```

7. Add each isolated interface to the primary VLAN:

```
[edit vlans]
user@switch# set pvlan interface ge-0/0/15.0

user@switch# set pvlan interface ge-0/0/16.0
```

Results Check the results of the configuration:

```
user@switch> show configuration vlans
finance-comm {
    interface {
        ge-0/0/13.0;
        ge-0/0/14.0;
    }
    primary-vlan pvlan;
}
    hr-comm {
        interface {
            ge-0/0/11.0;
            ge-0/0/12.0;
        }
        primary-vlan pvlan;
    }
    pvlan {
        vlan-id 1000;
        interface {
            ge-0/0/15.0;
            ge-0/0/16.0;
            ge-0/0/0.0;
            ge-1/0/0.0;
        }
        no-local-switching;
    }
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying the Private VLAN and Secondary VLANs Were Created on page 1111

Verifying the Private VLAN and Secondary VLANs Were Created

Purpose Verify that the primary VLAN and secondary VLANs were properly created on the switch.

Action Use the **show vlans** command:

```
user@switch> show vlans pvlan extensive
VLAN: pvlan, Created at: Tue Sep 16 17:59:47 2008
802.1Q Tag: 1000, Internal index: 18, Admin State: Enabled, Origin: Static

Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged  2 (Active = 0)
      ge-0/0/0.0, tagged, trunk
      ge-0/0/13.0, untagged, access
      ge-0/0/14.0, untagged, access
      ge-1/0/0.0, tagged, trunk

user@switch> show vlans __pvlan_pvlan_ge-0/0/15.0__ extensive
VLAN: __pvlan_pvlan_ge-0/0/15.0__, Created at: Tue Sep 16 17:59:47 2008
Internal index: 19, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged  1 (Active = 0)
      ge-0/0/0.0, tagged, trunk
      ge-0/0/15.0, untagged, access
      ge-1/0/0.0, tagged, trunk

user@switch> show vlans __pvlan_pvlan_ge-0/0/16.0__ extensive
```

```
VLAN: __pvlan_pvlan_ge-0/0/16.0__, Created at: Tue Sep 16 17:59:47 2008
Internal index: 20, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged  1 (Active = 0)
      ge-0/0/0.0, tagged, trunk
      ge-0/0/16.0, untagged, access
      ge-1/0/0.0, tagged, trunk
```

Meaning The output shows that the primary VLAN was created and identifies the interfaces and secondary VLANs associated with it.

Related Documentation

- Creating a Private VLAN (CLI Procedure) on page 1143

Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches

Virtual routing instances allow each J-EX Series switch to have multiple routing tables on a device. With virtual routing instances, you can segment your network to isolate traffic without setting up additional devices.

This example describes how to create virtual routing instances:

Requirements

This example uses the following hardware and software components:

- One J-EX Series switch

Before you create the virtual routing instances, make sure you have:

- Configured the necessary VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 1136 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 1133.

Overview and Topology

In a large office, you may need multiple VLANs to properly manage your traffic. This configuration example shows a simple topology to illustrate how to connect a single J-EX Series switch with a virtual routing instance for each of two VLANs, enabling traffic to pass between those VLANs.

In the example topology, the LAN is segmented into two VLANs, each associated with an interface and a routing instance on the J-EX Series switch.

Configuration

CLI Quick Configuration

To quickly create and configure virtual routing instances, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/3 vlan-tagging
set interfaces ge-0/0/3 unit 0 vlan-id 1030 family inet address 103.1.1.1/24
set interfaces ge-0/0/3 unit 1 vlan-id 1031 family inet address 103.1.1.1/24
set routing-instances r1 instance-type virtual-router
set routing-instances r1 interface ge-0/0/1.0
set routing-instances r1 interface ge-0/0/3.0
set routing-instances r2 instance-type virtual-router
set routing-instances r2 interface ge-0/0/2.0
set routing-instances r2 interface ge-0/0/3.1
```

Step-by-Step Procedure

To configure virtual routing instances:

1. Create a VLAN-tagged interface:

   ```
   [edit]
   user@switch# set interfaces ge-0/0/3 vlan-tagging
   ```

2. Create two subinterfaces, on the interface, one for each routing instance:

   ```
   [edit]
   user@switch# set interfaces ge-0/0/3 unit 0 vlan-id 1030 family inet address 103.1.1.1/24

   user@switch# set interfaces ge-0/0/3 unit 1 vlan-id 1031 family inet address 103.1.1.1/24
   ```

3. Create two virtual routers:

   ```
   [edit]
   user@switch# set routing-instances r1 instance-type virtual-router
   user@switch# set routing-instances r2 instance-type virtual-router
   ```

4. Set the interfaces for the virtual routers:

   ```
   [edit]
   user@switch# set routing-instances r1 interface ge-0/0/1.0

   user@switch# set routing-instances r1 interface ge-0/0/3.0

   user@switch# set routing-instances r2 interface ge-0/0/2.0

   user@switch# set routing-instances r2 interface ge-0/0/3.1
   ```

Results

Check the results of the configuration:

```
user@switch> show configuration
interfaces {
    ge-0/0/1 {
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-0/0/2 {
        unit 0 {
            family ethernet-switching;
        }
```

```
}
ge-0/0/3 {
  vlan-tagging;
  unit 0 {
    vlan-id 1030;
    family inet {
      address 103.1.1.1/24;
    }
  }
  unit 1 {
    vlan-id 1031;
    family inet {
      address 103.1.1.1/24;
    }
  }
}
routing-instances {
  r1 {
    instance-type virtual-router;
    interface ge-0/0/1.0;
    interface ge-0/0/3.0;
  }
  r2 {
    instance-type virtual-router;
    interface ge-0/0/2.0;
    interface ge-0/0/3.1;
  }
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- Verifying That the Routing Instances Were Created on page 1114

Verifying That the Routing Instances Were Created

Purpose Verify that the virtual routing instances were properly created on the switch.

Action Use the **show route instance** command:

```
user@switch> show route instance
Instance             Type
        Primary RIB                                    Active/holddown/hidden
master               forwarding
        inet.0                                         3/0/0

r1                   virtual-router
        r1.inet.0                                      1/0/0

r2                   virtual-router
        r2.inet.0                                      1/0/0
```

Meaning Each routing instance created is displayed, along with its type, information about whether it is active or not, and its primary routing table.

Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches

As a network expands and the number of clients and VLANs increases, VLAN administration becomes complex and the task of efficiently configuring VLANs on multiple J-EX Series switches becomes increasingly difficult. To automate VLAN administration, you can enable Multiple VLAN Registration Protocol (MVRP) on the network.

MVRP can also be used to dynamically create VLANs, further simplifying the network overhead required to statically configure VLANs.

NOTE: Only trunk interfaces can be enabled for MVRP.

This example describes how to use MVRP to automate administration of VLAN membership changes within your network and how to use MVRP to dynamically create VLANs:

Requirements

This example uses the following hardware and software components:

- Two J-EX Series access switches
- One J-EX Series distribution switch

Overview and Topology

MVRP is used to manage dynamic VLAN registration in a LAN. It can also be used to dynamically create VLANs.

This example uses MVRP to dynamically create VLANs on the switching network. You can disable dynamic VLAN creation and create VLANs statically, if desired. Enabling MVRP on the trunk interface of each switch in your switching network ensures that the active VLAN information for the switches in the network is propagated to each switch through the trunk interfaces, assuming dynamic VLAN creation is enabled for MVRP.

MVRP ensures that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs in a static or dynamic VLAN creation setup.

You do not need to explicitly bind a VLAN to the trunk interface. When MVRP is enabled, the trunk interface advertises all the VLANs that are active (bound to access interfaces) on that switch. An MVRP-enabled trunk interface does not advertise VLANs that have been configured on the switch but that are not currently bound to an access interface. Thus, MVRP provides the benefit of reducing network overhead—by limiting the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.

When VLAN access interfaces become active or inactive, MVRP ensures that the updated information is advertised on the trunk interface. Thus, in this example, distribution Switch C does not forward traffic to inactive VLANs.

This example shows a network with three VLANs: **finance**, **sales**, and **lab**.

Access Switch A has been configured to support all three VLANS and all three VLANS are active, bound to interfaces that are connected to personal computers:

- **ge-0/0/1**—Connects PC1 as a member of **finance**, VLAN ID 100
- **ge-0/0/2**—Connects PC2 as a member of **lab**, VLAN ID 200
- **ge-0/0/3**—Connects PC3 as a member of **sales**, VLAN ID 300

Access Switch B has also been configured to support three VLANS. However, currently only two VLANs are active, bound to interfaces that are connected to personal computers:

- **ge-0/0/0**—Connects PC4 as a member of **finance**, VLAN ID 100
- **ge-0/0/1**—Connects PC5 as a member of **lab**, VLAN ID 200

Distribution Switch C learns the VLANs dynamically using MVRP through the connection to the access switches. Distribution Switch C has two trunk interfaces:

- **xe-0/1/1**—Connects the switch to access Switch A.
- **xe-0/1/0**—Connects the switch to access Switch B.

Figure 31 on page 1117 shows MVRP configured on two access switches and one distribution switch.

Figure 31: MVRP Configured on Two Access Switches and One Distribution Switch for Automatic VLAN Administration

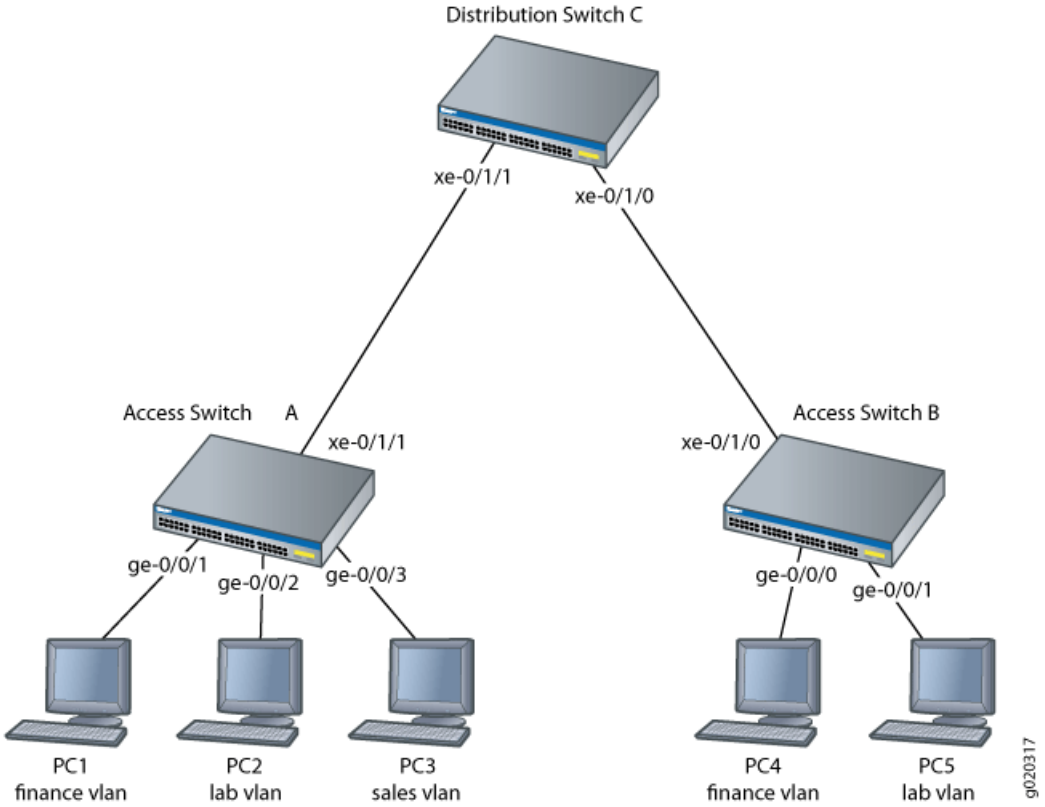

Table 149 on page 1117 explains the components of the example topology.

Table 149: Components of the Network Topology

Property	Settings
Switch hardware	• Access Switch A • Access Switch B • Distribution Switch C
VLAN names and tag IDs	**finance**, tag **100** **lab**, tag **200** **sales**, tag **300**

Table 149: Components of the Network Topology *(continued)*

Property	Settings
Interfaces	Access Switch A interfaces: • **ge-0/0/1**—Connects PC1 to access Switch A. • **ge-0/0/2**—Connects PC2 to access Switch A. • **ge-0/0/3**—Connects PC3 to access Switch A. • **xe-0/1/1**—Connects access Switch A to distribution Switch C (trunk). Access Switch B interfaces: • **ge-0/0/0**—Connects PC4 to access Switch B. • **ge-0/0/1**—Connects PC5 to access Switch B. • **xe-0/1/0**—Connects access Switch B to distribution Switch C. (trunk) Distribution Switch C interfaces: • **xe-0/1/1**—Connects distribution Switch C to access Switch A. (trunk) • **xe-0/1/0**—Connects distribution Switch C to access Switch B. (trunk)

Configuring VLANs and MVRP on Access Switch A

To configure VLANs on the switch, bind access interfaces to the VLANs, and enable MVRP on the trunk interface of access Switch A, perform these tasks:

CLI Quick Configuration

To quickly configure access Switch A for MVRP, copy the following commands and paste them into the switch terminal window of Switch A:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members finance
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members lab
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/1/1 unit 0 family ethernet-switching port-mode trunk
set protocols mvrp interface xe-0/1/1.0
```

NOTE: As we recommend as a best practice, default MVRP timers are used in this example. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms for the leaveall timer. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Step-by-Step Procedure

To configure access Switch A for MVRP:

1. Configure the finance VLAN:

```
[edit]
user@Access-Switch-A# set vlans finance vlan-id 100
```

2. Configure the lab VLAN:

```
[edit]
user@Access-Switch-A# set vlans lab vlan–id 200
```

3. Configure the sales VLAN:

```
[edit]
user@Access-Switch-A# set vlans sales vlan–id 300
```

4. Configure an Ethernet interface as a member of the finance VLAN:

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan
members finance
```

5. Configure an Ethernet interface as a member of the lab VLAN:

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan
members lab
```

6. Configure an Ethernet interface as a member of the sales VLAN:

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan
members sales
```

7. Configure a trunk interface:

```
[edit]
user@Access-Switch-A# set interfaces xe-0/1/1 unit 0 family ethernet-switching
port-mode trunk
```

8. Enable MVRP on the trunk interface:

```
[edit]
user@Access-Switch-A# set protocols mvrp interface xe-0/1/1.0
```

Results

Check the results of the configuration:

```
[edit]
  user@switch# show
  interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members finance;
        }
      }
    }
  }
  ge-0/0/2 {
```

```
        unit 0 {
          family ethernet-switching {
            vlan {
              members lab;
            }
          }
        }
      }
      ge-0/0/3 {
        unit 0 {
          family ethernet-switching {
            vlan {
              members sales;
            }
          }
        }
      }
      xe-0/1/1 {
        unit 0 {
          family ethernet-switching {
            port-mode trunk;
          }
        }
      }
    }

    protocols {
      mvrp {
        interface xe-0/1/1.0;
      }
    }

    vlans {
      finance {
        vlan-id 100;
      }
      lab {
        vlan-id 200;
      }
      sales {
        vlan-id 300;
        }
      }
```

Configuring VLANs and MVRP on Access Switch B

To configure three VLANs on the switch, bind access interfaces for PC4 and PC5 to the VLANs, and enable MVRP on the trunk interface of access Switch B, perform these tasks:

CLI Quick Configuration

To quickly configure Access Switch B for MVRP, copy the following commands and paste them into the switch terminal window of Switch B:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members finance
```

```
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members lab
set interfaces xe-0/1/0 unit 0 family ethernet-switching port-mode trunk
set protocols mvrp interface xe-0/1/0.0
```

Step-by-Step Procedure

To configure access Switch B for MVRP:

1. Configure the finance VLAN:

```
[edit]
user@Access-Switch-B# set vlans finance vlan-id 100
```

2. Configure the lab VLAN:

```
[edit]
user@Access-Switch-B# set vlans lab vlan–id 200
```

3. Configure the sales VLAN:

```
[edit]
user@Access-Switch-B# set vlans sales vlan–id 300
```

4. Configure an Ethernet interface as a member of the finance VLAN:

```
[edit]
user@Access-Switch-B# set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan
members finance
```

5. Configure an Ethernet interface as a member of the lab VLAN:

```
[edit]
user@Access-Switch-B# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan
members lab
```

6. Configure a trunk interface:

```
user@Access-Switch-B# set interfaces xe-0/1/0 unit 0 family ethernet-switching
port-mode trunk
```

7. Enable MVRP on the trunk interface:

```
[edit]
user@Access-Switch-B# set protocols mvrp xe-0/1/0.0
```

NOTE: As we recommend as a best practice, default MVRP timers are used in this example. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms for the leaveall timer. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Results

Check the results of the configuration:

```
[edit]
user@Access-Switch-B# show
interfaces {
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        vlan {
```

```
            members finance;
          }
        }
      }
    }
    ge-0/0/1 {
      unit 0 {
        family ethernet-switching {
          vlan {
            members lab;
          }
        }
      }
    }
    xe-0/1/0 {
      unit 0 {
        family ethernet-switching {
          port-mode trunk;
        }
      }
    }
    }
}

protocols {
  mvrp {
    interface xe-0/1/0.0;
  }
}
vlans {
  finance {
    vlan-id 100;
  }
  lab {
    vlan-id 200;
  }
  sales {
    vlan-id 300;
  }
}
```

Configuring VLANS and MVRP on Distribution Switch C

CLI Quick Configuration

To quickly configure distribution Switch C for MVRP, copy the following commands and paste them into the switch terminal window of distribution Switch C:

```
[edit]
set interfaces xe-0/1/1 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/1/0 unit 0 family ethernet-switching port-mode trunk
set protocols mvrp interface xe-0/1/1.0
set protocols mvrp interface xe-0/1/0.0
```

Step-by-Step Procedure

To configure distribution Switch C for MVRP:

1. Configure the trunk interface to access Switch A:

```
[edit]
user@Distribution-Switch-C# set interfaces xe-0/1/1 unit 0 family ethernet-switching
port-mode trunk
```

2. Configure the trunk interface to access Switch B:

```
[edit]
user@Distribution-Switch-C# set interfaces xe-0/1/0 unit 0 family ethernet-switching
port-mode trunk
```

3. Enable MVRP on the trunk interface for **xe-0/1/1** :

```
[edit]
user@Distribution-Switch-C# set protocols mvrp interface xe-0/1/1.0
```

4. Enable MVRP on the trunk interface for **xe-0/1/0** :

```
[edit]
user@Distribution-Switch-C# set protocols mvrp interface xe-0/1/0.0
```

Results

Check the results of the configuration:

```
[edit]
user@Distribution Switch-D# show
interfaces {
  xe-0/1/0 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
      }
    }
  }
  xe-0/1/1 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
      }
    }
  }
}
  protocols {
    mvrp {
      interface xe-0/1/0.0;
      interface xe-0/1/1.0;
    }
```

Verification

To confirm that the configuration is updating VLAN membership, perform these tasks:

- Verifying That MVRP Is Enabled on Access Switch A on page 1124
- Verifying That MVRP Is Updating VLAN Membership on Access Switch A on page 1124
- Verifying That MVRP Is Enabled on Access Switch B on page 1124

Verifying That MVRP Is Enabled on Access Switch A

Purpose Verify that MVRP is enabled on the switch.

Action Show the MVRP configuration:

```
user@Access-Switch-A> show mvrp
MVRP configuration
MVRP status                  : Enabled
MVRP dynamic VLAN creation   : Enabled

MVRP timers (ms):
Interface            Join   Leave       LeaveAll
--------------       -----  --------    -----------
all                   200   1000        10000
xe-0/1/1.0            200   1000        10000

Interface       Status        Registration Mode
--------------  --------      -----------------
all             Disabled      Normal
xe-0/1/1.0      Enabled       Normal
```

Meaning The results show that MVRP is enabled on the trunk interface of Switch A and that the default timers are used.

Verifying That MVRP Is Updating VLAN Membership on Access Switch A

Purpose Verify that MVRP is updating VLAN membership by displaying the Ethernet switching interfaces and associated VLANs that are active on Switch A.

Action List Ethernet switching interfaces on the switch:

```
user@Access-Switch-A> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/1.0  up       finance                unblocked
ge-0/0/2.0  up       lab                    unblocked
ge-0/0/3.0  up       sales                  unblocked
xe-0/1/1.0  up       finance                unblocked
                     lab                    unblocked
```

Meaning MVRP has automatically added **finance** and **lab** as VLAN members on the trunk interface because they are being advertised by access Switch B.

Verifying That MVRP Is Enabled on Access Switch B

Purpose Verify that MVRP is enabled on the switch.

Action Show the MVRP configuration:

```
user@Access-Switch-B> show mvrp

MVRP configuration
```

```
MVRP status                 : Enabled
MVRP dynamic VLAN creation  : Enabled

MVRP timers (ms):
Interface         Join   Leave       LeaveAll
--------------    -----  --------    -----------
all                200   1000       10000
xe-0/1/0.0         200   1000       10000

Interface       Status        Registration Mode
--------------  --------      -----------------
all             Disabled      Normal
xe-0/1/0.0      Enabled       Normal
```

Meaning The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.

Verifying That MVRP Is Updating VLAN Membership on Access Switch B

Purpose Verify that MVRP is updating VLAN membership by displaying the Ethernet switching interfaces and associated VLANs that are active on Switch B.

Action List Ethernet switching interfaces on the switch:

```
user@Access-Switch-B> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
ge-0/0/0.0  up       finance                unblocked
ge-0/0/1.0  up       lab                    unblocked
xe-0/1/1.0  up       finance                unblocked
                     lab                    unblocked
                     sales                  unblocked
```

Meaning MVRP has automatically added **finance**, **lab**, and **sales** as VLAN members on the trunk interface because they are being advertised by access Switch A.

Verifying That MVRP Is Enabled on Distribution Switch C

Purpose Verify that MVRP is enabled on the switch.

Action Show the MVRP configuration:

```
user@Distribution-Switch-C> show mvrp

MVRP configuration
MVRP status                 : Enabled
MVRP dynamic VLAN creation  : Enabled

MVRP timers (ms):
Interface            Join   Leave       LeaveAll
--------------       -----  --------    -----------
all                   200   1000        10000
xe-0/0/1.0            200   1000        10000
xe-0/1/1.0            200   1000        10000

Interface       Status        Registration Mode
--------------  --------      -----------------
all             Disabled      Normal
```

```
xe-0/0/1.0      Enabled       Normal
xe-0/1/1.0      Enabled       Normal
```

Verifying That MVRP Is Updating VLAN Membership on Distribution Switch C

Purpose Verify that MVRP is updating VLAN membership on distribution Switch C by displaying the Ethernet switching interfaces and associated VLANs on distribution Switch C.

Action List the Ethernet switching interfaces on the switch:

```
user@Distribution-Switch-C> show ethernet-switching interfaces
Interface   State    VLAN members           Blocking
xe-0/1/1.0  up       __mvrp_100__           unblocked
                     __mvrp_200__           unblocked
                     __mvrp_300__           unblocked
xe-0/1/0.0  up       __mvrp_100__           unblocked
                     __mvrp_200__           unblocked
```

List the VLANs that were created dynamically using MVRP on the switch:

```
user@Distribution-Switch-C> show mvrp dynamic-vlan-memberships
VLAN Name                Interfaces
-------------------      ----------------
__mvrp_100__             xe-0/1/1.0
                         xe-0/1/0.0
__mvrp_200__             xe-0/1/1.0
                         xe-0/1/0.0
__mvrp_300__             xe-0/1/1.0
```

Meaning Distribution Switch C has two trunk interfaces. Interface **xe-0/1/1.0** connects distribution Switch C to Access Switch A and is therefore updated to show that it is a member of all the VLANs that are active on Switch A. Any traffic for those VLANs will be passed on from distribution Switch C to Switch A, through interface **xe-0/1/1.0**. Interface **xe-0/1/0.0** connects distribution Switch C to Switch B and is updated to show that it is a member of the two VLANs that are active on Switch B. Thus, distribution Switch C sends traffic for **finance** and **lab** to both Switch A and Switch B. But distribution Switch C sends traffic for **sales** only to Switch A.

Distribution Switch C also has three dynamic VLANs created using MVRP: **mvrp_100**, **mvrp_200**, and **mvrp_300**. The dynamically created VLANs **mvrp_100** and **mvrp_200** are active on interfaces **xe-0/1/1.0** and **xe-0/1/1.0**, and dynamically created VLAN **mvrp_300** is active on interface **xe-0/1/1.0**.

Related Documentation

- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147
- Understanding Multiple VLAN Registration Protocol (MVRP) on J-EX Series Switches on page 1054

Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to J-EX Series switches that are not part of the local broadcast domain. This feature is useful when you want to run Layer 2

protocols on a network that includes switches located at remote sites that are connected across a service provider network.

This example describes how to configure L2PT:

Requirements

This example uses the following hardware and software components:

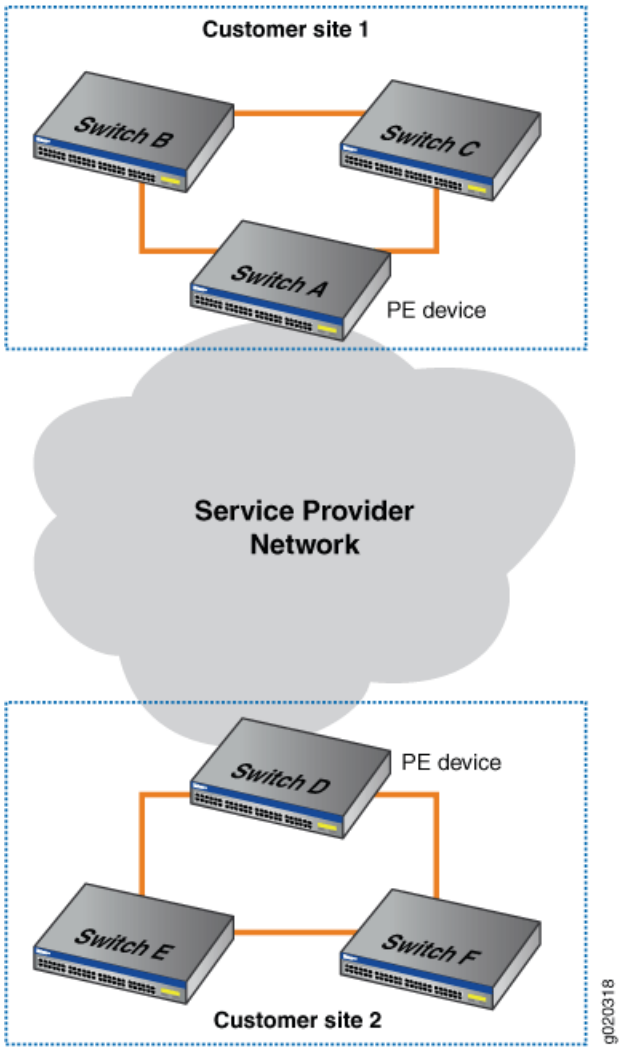
- Six J-EX Series switches, with three each at two customer sites, with one of the switches at each site designated as the provider edge (PE) device

Overview and Topology

L2PT allows you to send Layer 2 PDUs across a service provider network and deliver them to J-EX Series switches that are not part of the local broadcast domain.

Figure 32 on page 1128 shows a customer network that includes two sites that are connected across a service provider network. Site 1 contains three switches connected in a Layer 2 network, with Switch A designated as a provider edge (PE) device in the service provider network. Site 2 contains a Layer 2 network with a similar topology to that of Site 1, with Switch D designated as a PE device.

Figure 32: L2PT Topology



When you enable L2PT on a VLAN, Q-in-Q tunneling is also (and must be) enabled. Q-in-Q tunneling ensures that Switches A, B, C, D, E, and F are part of the same broadcast domain.

This example uses STP as the Layer 2 protocol being tunneled, but you could substitute any of the supported protocols for STP. You can also use the **all** keyword to enable L2PT for all supported Layer 2 protocols.

Tunneled Layer 2 PDUs do not normally arrive at high rate. If the tunneled Layer 2 PDUs do arrive at high rate, there might be a problem in the network. Typically, you would want to shut down the interface that is receiving a high rate of tunneled Layer 2 PDUs so that problem can be isolated. However, if you do not want to completely shut down the interface, you can configure the switch to drop tunneled Layer 2 PDUs that exceed a certain threshold.

The **drop-theshold** configuration statement allows you to specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs. The drop threshold must be less than or equal to the shutdown threshold. If the drop threshold is greater than the shutdown threshold and you try to commit the configuration, the commit will fail.

The **shutdown-threshold** configuration statement allows you to specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the specified interface is disabled. The shutdown threshold must be greater than or equal to the drop threshold. You can specify a drop threshold without specifying a shutdown threshold, and you can specify a shutdown threshold without specifying a drop threshold. If you do not specify these thresholds, then no thresholds are enforced. As a result, the switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

In this example, we will configure both a drop threshold and a shutdown threshold to show how this is done.

If L2PT-encapsulated packets are received on an access interface, the switch reacts as it does when there is a loop between the service provider network and the customer network and shuts down (disables) the access interface.

Once an interface is disabled, you must explicitly reenable it using the **clear ethernet-switching layer2-protocol-tunneling error** command or else the interface will remain disabled.

Configuration

To configure L2PT, perform these tasks:

CLI Quick Configuration

To quickly configure L2PT, copy the following commands and paste them into the switch terminal window of each PE device (in Figure 32 on page 1128, Switch A and Switch D are the PE devices):

```
[edit]
set vlans customer-1 dot1q-tunneling
set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp drop-threshold 50
set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp shutdown-threshold 100
```

Step-by-Step Procedure

To configure L2PT, perform these tasks on each PE device (in Figure 32 on page 1128, Switch A and Switch D are the PE devices):

1. Enable Q-in-Q tunneling on VLAN **customer-1**:

   ```
   [edit]
   user@switch# set vlans customer-1 dot1q-tunneling
   ```

2. Enable L2PT for STP on VLAN **customer-1**:

   ```
   [edit]
   user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
   ```

3. Configure the drop threshold as **50**:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2–protocol-tunneling stp
drop-threshold 50
```

4. Configure the shutdown threshold as **100**:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2–protocol-tunneling stp
shutdown-threshold 100
```

Results Check the results of the configuration:

```
[edit]
user@switch# show vlans customer-1 dot1q-tunneling
layer2-protocol-tunneling {
  stp {
    drop-threshold 50;
    shutdown-threshold 100;
  }
}
```

Verification

To verify that L2PT is working correctly, perform this task:

- Verify That L2PT Is Working Correctly on page 1130

Verify That L2PT Is Working Correctly

Purpose Verify that Q-in-Q tunneling and L2PT are enabled.

Action Check to see that Q-in-Q tunneling and L2PT are enabled on each PE device (Switch A and Switch D are the PE devices):

```
user@switchA> show vlans extensive customer-1
VLAN: customer-1, Created at: Thu Jun 25 05:07:38 2009
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Dot1q Tunneling status: Enabled
Layer2 Protocol Tunneling status: Enabled
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 0 (Active = 0), Untagged  3 (Active = 0)
      ge-0/0/7.0, untagged, access
      ge-0/0/8.0, untagged, access
      ge-0/0/9.0, untagged, access
```

Check to see that L2PT is tunneling STP on VLAN **customer-1** and that **drop-threshold** and **shutdown-threshold** have been configured:

```
user@switchA> show ethernet-switching layer2-protocol-tunneling vlan customer-1

Layer2 Protocol Tunneling VLAN information:
VLAN          Protocol      Drop       Shutdown
                            Threshold  Threshold
customer-1    stp           50         100
```

Check the state of the interfaces on which L2PT has been enabled, including what kind of operation (encapsulation or decapsulation) they are performing:

```
user@switchA> show ethernet-switching layer2-protocol-tunneling interface

Layer2 Protocol Tunneling information:
Interface     Operation       State      Description
ge-0/0/0.0    Encapsulation   Shutdown   Shutdown threshold exceeded
ge-0/0/1.0    Decapsulation   Shutdown   Loop detected
ge-0/0/2.0    Decapsulation   Active
```

Meaning The **show vlans extensive customer-1** command shows that Q-in-Q tunneling and L2PT have been enabled. The **show ethernet-switching layer2-protocol-tunneling vlan customer-1** command shows that L2PT is tunneling the STP protocol on VLAN **customer-1**, the drop threshold is set to **50**, and the shutdown threshold is set to **100**. The **show ethernet-switching layer2-protocol-tunneling interface** command shows the type of operation being performed on each interface, the state of each interface and, if the state is **Shutdown**, the reason why the interface is shut down.

CHAPTER 59

Configuring Bridging and VLANs

Configuring VLANs for J-EX Series Switches (J-Web Procedure)

You can use the VLAN Configuration page to add a new VLAN or to edit or delete an existing VLAN on a J-EX Series switch.

To access the VLAN Configuration page:

1. Select **Configure** > **Switching** > **VLAN**.

   The VLAN Configuration page displays a list of existing VLANs. If you select a specific VLAN, the specific VLAN details are displayed in the Details section.

NOTE: After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334s for details about all commit options.

2. Click one:
   - **Add**—creates a VLAN.
   - **Edit**—edits an existing VLAN configuration.
   - **Delete**—deletes an existing VLAN.

NOTE: If you delete a VLAN, the VLAN configuration for all the associated interfaces is also deleted.

When you are adding or editing a VLAN, enter information as described in Table 150 on page 1134.

Table 150: VLAN Configuration Details

Field	Function	Your Action
General tab		
VLAN Name	Specifies a unique name for the VLAN.	Enter a name.
VLAN Id/Range	Specifies the identifier or range for the VLAN.	Select one: • VLAN ID—Type a unique identification number from **1** through **4094**. If no value is specified, it defaults to 0. • VLAN Range—Type a number range to create VLANs with IDs corresponding to the range. For example, the range **2–3** will create two VLANs with the IDs **2** and **3**.
Description	Describes the VLAN.	Enter a brief description for the VLAN.
MAC-Table-Aging-Time	Specifies the maximum time that an entry can remain in the forwarding table before it 'ages out'.	Type the number of seconds from **60** through **1000000**.
Input filter	Specifies the VLAN firewall filter that is applied to incoming packets.	To apply an input firewall filter, select the firewall filter from the list.
Output filter	Specifies the VLAN firewall filter that is applied to outgoing packets.	To apply an output firewall filter, select the firewall filter from the list.
Ports tab		

Table 150: VLAN Configuration Details *(continued)*

Field	Function	Your Action
Ports	Specifies the ports (interfaces) to be associated with this VLAN for data traffic. You can also remove the port association.	Click one: • **Add**—Select the ports from the available list. • **Remove**—Select the port that you do not want associated with the VLAN.
IP address tab		
IPv4 address	Specifies IPv4 address options for the VLAN.	Select **IPv4 address** to enable the IPv4 address options. To configure IPv4: 1. Enter the IP address. 2. Enter the subnet mask—for example, **255.255.255.0**. You can also specify the address prefix. 3. To apply an input firewall filter to an interface, select the firewall filter from the list. 4. To apply an output firewall filter to an interface, select the firewall filter from the list. 5. Click the **ARP/MAC Details** button. Enter the static IP address and MAC address in the window that is displayed.
IPv6 address	Specifies IPv6 address options for the VLAN.	Select **IPv6 address** to enable the IPv6 address options. To configure IPv6: 1. Enter the IP address—for example: **2001:ab8:85a3::8a2e:370:7334**. 2. Specify the subnet mask.
Voip tab		
Ports	Specifies the ports to be associated with this VLAN for voice traffic. You can also remove the port association. NOTE: VoIP is not supported on J-EX8200 switches.	Click one: • **Add**—Select the ports from the available list. • **Remove**—Select the port that you do not want associated with the VLAN.

Configuring VLANs for J-EX Series Switches (CLI Procedure)

J-EX Series switches use VLANs to make logical groupings of network nodes with their own broadcast domains. You can use VLANs to limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

For each endpoint on the VLAN, configure the following VLAN parameters on the corresponding interface:

1. Set the description of the VLAN:

```
[edit interfaces interface-name unit 0]
user@switch# set description vlan-description
```

2. Set the unique name of the VLAN:

```
[edit interfaces interface-name unit 0]
user@switch# set family ethernet-switching vlan members vlan-name
```

3. Create the subnet for the VLAN:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address ip-address
```

4. Configure the VLAN tag ID or VLAN ID range for the VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

   or

```
[edit vlans]
user@switch# set vlan-name vlan-range vlan-id-low-vlan-id-high
```

5. To specify the maximum time that an entry can remain in the forwarding table before it ages out (optional):

```
[edit vlans]
user@switch# set vlan-name mac-table-aging-time time
```

6. To specify a VLAN firewall filter to be applied to incoming or outgoing packets (optional):

```
[edit vlans]
user@switch# set vlan-name filter (input | output) filter-name
```

Configuring Routed VLAN Interfaces (CLI Procedure)

Routed VLAN interfaces (RVIs) enable the J-EX Series switch to recognize which packets are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when needed. Whenever packets can be switched instead of routed, several layers of processing are eliminated. Switching also reduces the number of address lookups.

An interface named **vlan** functions as the logical router, on which you can configure a Layer 3 logical interface for each VLAN. For redundancy, an RVI can be combined with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and VPLS environments.

Jumbo frames of up to 9216 bytes are supported on an RVI. To route jumbo data packets on the RVI, you must configure the jumbo MTU size on the member physical interfaces of the RVI and not on the RVI itself (the **vlan** interface). However, for jumbo control packets—for example, to ping the RVI with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the interface named **vlan** (the RVI).

CAUTION: Setting or deleting the jumbo MTU size on the RVI (the vlan interface) while the switch is transmitting packets might result in dropped packets.

To configure the routed VLAN interface (RVI):

1. Create a Layer 2 VLAN by assigning it a name (for example, **support**) and a VLAN ID (for example, **111**).

   ```
   [edit]
   user@switch# set vlans support vlan-id 111
   ```

2. Assign an interface (for example, **ge-0/0/18**) to the VLAN (**support**) by naming the VLAN as a trunk member on the logical interface, thereby making the interface part of the VLAN's broadcast domain.

   ```
   [edit]
   user@switch# set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members
   support
   ```

3. Create a logical Layer 3 RVI (**vlan.111**) on a subnet for the VLAN's broadcast domain.

   ```
   [edit]
   user@switch# set interfaces vlan unit 111 family inet address 111.111.111.1/24
   ```

4. Link the Layer 2 VLAN to the logical Layer 3 interface.

   ```
   [edit]
   user@switch# set vlans support l3-interface vlan.111
   ```

NOTE: Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

You can display the configuration settings:

```
user@switch> show interfaces vlan terse
Interface               Admin Link Proto    Local                 Remote
vlan                    up    up
vlan.111                up    up   inet     111.111.111.1/24

user@switch> show vlans
Name            Tag     Interfaces

Configuring MAC Table Aging (CLI Procedure)

The aging process ensures that the J-EX Series switch tracks only active nodes on the network and that it is able to flush out network nodes that are no longer available.

To manage MAC entries more efficiently, you can configure an entry's aging time, which is the maximum time that an entry can remain in the Ethernet Switching table before it “ages out”.

To configure how long entries remain in the Ethernet Switching table before expiring, using the CLI (here, the VLAN is **employee-vlan**):

```
[edit vlans employee-vlan]
user@switch# set mac-table-aging-time 200
```

Configuring the Native VLAN Identifier (CLI Procedure)

J-EX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. The logical interface on which untagged packets are to be received must be configured with the same native VLAN ID as that configured on the physical interface.

To configure the native VLAN ID using the CLI:

1. Configure the port mode so that the interface is in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN. Configure the port mode as **trunk**:

```
[edit interfaces ge-0/0/3 unit 0 family ethernet-switching]
user@switch# set port-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces ge-0/0/3 unit 0 family ethernet-switching]
user@switch# set native-vlan-id 3
```

Creating a Series of Tagged VLANs (CLI Procedure)

To identify which VLAN traffic belongs to, all frames on an Ethernet VLAN are identified by a tag, as defined in the IEEE 802.1Q standard. These frames are *tagged* and are encapsulated with 802.1Q tags. For a simple network that has only a single VLAN, all traffic has the same 802.1Q tag.

Instead of configuring VLANS and 802.1Q tags one at a time for a trunk interface, you can configure a VLAN range to create a series of tagged VLANs.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames know which VLAN the frames belong to. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine the origin of frames and where to forward them.

For example, you could configure the VLAN **employee** and specify a tag range of **10-12**. This creates the following VLANs and tags:

- VLAN **employee-10**, tag **10**
- VLAN **employee-11**, tag **11**
- VLAN **employee-12**, tag **12**

Creating tagged VLANs in a series has the following limitations:

- Layer 3 interfaces do not support this feature.
- Because an access interface can only support one VLAN member, access interfaces also do not support this feature.
- Voice over IP (VoIP) configurations do not support a range of tagged VLANs.

To configure a series of tagged VLANs using the CLI (here, the VLAN is **employee**):

1. Configure the series (here, a VLAN series from 120 through 130):

```
[edit]
user@switch# set vlans employee vlan-range 120-130
```

2. Associate a series of tagged VLANs when you configure an interface in one of two ways:

- Include the name of the series:

```
[edit interfaces]
user@switch# set interfaces ge-0/0/22.0 family ethernet-switching vlan members
employee
```

- Include the VLAN range:

```
[edit interfaces]
user@switch# set interfaces ge-0/0/22.0 family ethernet-switching vlan members
120–130
```

Associating a series of tagged VLANS to an interface by name or by VLAN range have the same result: VLANs **__employee_120__** through **__employee_130__** are created.

NOTE: When a series of VLANs are created using the vlan-range command, the VLAN names are prefixed and suffixed with a double underscore.

Related Documentation

Configuring Virtual Routing Instances (CLI Procedure)

Use virtual routing and forwarding (VRF) to divide a J-EX Series switch into multiple virtual routing instances. VRF allows you to isolate traffic traversing the network without using multiple devices to segment your network. VRF is supported on all Layer 3 interfaces.

Before you begin, make sure to set up your VLANs. See "Configuring VLANs for J-EX Series Switches (CLI Procedure)" on page 1136 or "Configuring VLANs for J-EX Series Switches (J-Web Procedure)" on page 1133.

To configure virtual routing instances:

1. Create a routing instance:

   ```
   [edit routing-instances]
   user@switch# set routing-instance-name instance-type virtual-router
   ```

   

   NOTE: J-EX Series switches only support the virtual-router instance type.

2. Bind each routing instance to the corresponding physical interfaces:

   ```
   [edit routing-instances]
   user@switch# set routing-instance-name interface interface-name.logical-unit-number
   ```

3. Create the logical interfaces that are bound to the routing instance.

   - To create a logical interface with an IPv4 address:

     ```
     [edit interfaces]
     user@switch# set interface-name unit logical-unit-number family inet address ip-address
     ```

   - To create a logical interface with an IPv6 address:

     ```
     [edit interfaces]
     user@switch# set interface-name unit logical-unit-number family inet6 address
     ipv6–address
     ```

     

     NOTE: Do not create a logical interface using the family ethernet-switching option in this step. Binding an interface using the family ethernet-switching option to a routing instance can cause the interface to shutdown.

4. Enable VLAN tagging on each physical interface that was bound to the routing instance:

   ```
   [edit interfaces]
   user@switch# set interface-name vlan-tagging
   ```

Related Documentation

- Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches on page 1112
- Verifying That Virtual Routing Instances Are Working on page 1157

- Understanding Virtual Routing Instances on J-EX Series Switches on page 1048

Creating a Private VLAN (CLI Procedure)

The private VLAN (PVLAN) feature on J-EX Series switches allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN.

Before you begin, make sure you set up your VLANs. See “Configuring VLANs for J-EX Series Switches (CLI Procedure)” on page 1136 or “Configuring VLANs for J-EX Series Switches (J-Web Procedure)” on page 1133.

NOTE: Configuring a voice over IP (VoIP) VLAN on PVLAN interfaces is not supported.

To configure a private VLAN:

1. Set the primary VLAN to have no local switching:

   NOTE: The primary VLAN must be a tagged VLAN.

   ```
   [edit vlans]
   user@switch# set primary-vlan-name no-local-switching
   ```

2. For each community VLAN, configure access interfaces:

   NOTE: The secondary VLANs must be untagged VLANs.

   ```
   [edit vlans]
   user@switch# set community-vlan-name interface interface-name
   ```

3. For each community VLAN, set the primary VLAN:

   ```
   [edit vlans]
   user@switch# set community-vlan-name primary-vlan primary-vlan-name
   ```

4. For each isolated VLAN, add the interface to the primary VLAN:

   ```
   [edit vlans]
   user@switch# set primary-vlan-name interface interface-name
   ```

Related Documentation

- Example: Configuring a Private VLAN on a J-EX Series Switch on page 1107
- Verifying That a Private VLAN Is Working on page 1159
- Understanding Private VLANs on J-EX Series Switches on page 1047

Configuring Q-in-Q Tunneling (CLI Procedure)

Q-in-Q tunneling allows service providers on Ethernet access networks to segregate or bundle customer traffic into different VLANs by adding another layer of 802.1Q tags. You can configure Q-in-Q tunneling on J-EX Series switches.

Before you begin configuring Q-in-Q tunneling, make sure you set up your VLANs. See "Configuring VLANs for J-EX Series Switches (CLI Procedure)" on page 1136 or "Configuring VLANs for J-EX Series Switches (J-Web Procedure)" on page 1133.

To configure Q-in-Q tunneling:

1. Enable Q-in-Q tunneling on the S-VLAN:

   ```
   [edit vlans]
   user@switch# set s-vlan-name dot1q-tunneling
   ```

2. Set the allowed C-VLANs on the S-VLAN (optional). Here, the C-VLANs are identified by VLAN range:

   ```
   [edit vlans]
   user@switch# set s-vlan-name dot1q-tunneling customer-vlans range
   ```

3. Change the global Ethertype value (optional):

   ```
   [edit]
   user@switch# set ethernet-switching-options dot1q-tunneling ether-type
   ether-type-value
   ```

4. Disable MAC address learning on the S-VLAN (optional):

   ```
   [edit vlans]
   user@switch# set s-vlan-name no-mac-learning
   ```

Related Documentation

Configuring GVRP (J-Web Procedure)

As a network expands and the number of clients and VLANs increases, VLAN administration becomes complex, and the task of efficiently configuring VLANs on multiple J-EX Series switches becomes increasingly difficult. To automate VLAN administration, you can enable GARP VLAN Registration Protocol (GVRP) on the network.

GVRP learns VLANs on a particular 802.1Q trunk port and adds the corresponding trunk interface to the VLAN if the advertised VLAN is preconfigured or already exists on the switch. For example, a VLAN named "sales" is advertised to trunk interface 1 on the GVRP-enabled switch. The switch adds trunk interface 1 to the sales VLAN if the sales VLAN already exists on the switch.

As individual interfaces become active and send requests to join a VLAN, the VLAN configuration is updated and propagated among the switches. Limiting the VLAN configuration to active participants reduces the network overhead. GVRP also provides the benefit of pruning VLANs to limit the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested network devices only.

To configure GVRP using the J-Web interface:

1. Select **Configure > Switching > GVRP**. Interfaces on which GVRP has been enabled are listed.

   

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. To enable GVRP on an interface, click **Add**. Click the arrow key to move the interface from the **Interface Out of GVRP** list to the **Interface under GVRP** list, and click **OK**.
3. To modify GVRP timers, click **Global Settings**. For modifying GVRP Timer settings for the interface, enter information as described in Table 151 on page 1145.
4. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

To disable an interface, select the interface and click **Disable Port**.

Table 151: GVRP Timer Settings

Field	Function	Your Action
Join Timer	Specifies the maximum number of milliseconds the interface waits before sending VLAN advertisements.	Type a number.
Leave Timer	Specifies the number of milliseconds an interface waits after receiving a leave message before the interface leaves the VLAN specified in the message.	Type a number.
Leave All Timer	Specifies the interval in milliseconds at which Leave All messages are sent on interfaces. Leave All messages help to maintain current GVRP VLAN membership information in the network.	Type a number.
Disable GVRP	Disables GVRP on all interfaces.	To disable GVRP, select the check box. To enable GVRP, clear the check box.

Configuring Redundant Trunk Groups (J-Web Procedure)

A redundant trunk link provides a simple solution for network recovery when a trunk interface goes down. Traffic is routed to another trunk interface, keeping network convergence time to a minimum. You can configure redundant trunk groups (RTGs) with a primary link and a secondary link on trunk interfaces, or configure dynamic selection of the active interface. If the primary link fails, the secondary link automatically takes over without waiting for normal STP convergence. An RTG can be created only if the following conditions are satisfied:

- A minimum of two trunk interfaces that are not part of any RTG are available.
- All the selected trunk interfaces to be added to the RTG have the same VLAN configuration.
- The selected trunk interfaces are not part of a spanning-tree configuration.

To configure an RTG using the J-Web interface:

1. Select **Configure** > **Switching** > **RTG**.

   The RTG Configuration page displays a list of existing RTGs. If you select a specific RTG, the details of the selected RTG are displayed in the Details of group section.

   

   NOTE: After you make changes to the configuration in this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select Commit Options > Commit. See "Using the Commit Options to Commit Configuration Changes (J-Web Procedure)" on page 334 for details about all commit options.

2. Click one:
   - **Add**—Creates an RTG.
   - **Edit**—Modifies an RTG.
   - **Delete**—Deletes an RTG.

   When you are adding or editing an RTG, enter information as described in Table 152 on page 1146.

3. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

Table 152: RTG Configuration Fields

Field	Function	Your Action
Group Name	Specifies a unique name for the RTG.	Enter a name.
Member Interface 1	Specifies a logical interface containing multiple trunk interfaces.	Select a trunk interface from the list.

Table 152: RTG Configuration Fields *(continued)*

Field	Function	Your Action
Member Interface 2	Specifies a trunk interface containing multiple VLANs.	Select a trunk interface from the list.
Select Primary Interface	Enables you to specify one of the interfaces in the RTG as the primary link. The interface without this option is the secondary link in the RTG.	1. Select the option button. 2. Select the primary interface.
Dynamically select my active interface	Specifies that the system dynamically selects the active interface.	Select the option button.

Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)

Multiple VLAN Registration Protocol (MVRP) is used to manage dynamic VLAN registration in a LAN. You can use MVRP on J-EX Series switches.

MVRP is disabled by default on J-EX Series switches.

To enable MVRP or set MVRP options, follow these instructions:

- Enabling MVRP on page 1147
- Disabling MVRP on page 1147
- Disabling Dynamic VLANs on page 1148
- Configuring Timer Values on page 1148
- Configuring MVRP Registration Mode on page 1149

Enabling MVRP

MVRP can only be enabled on trunk interfaces.

To enable MVRP on all trunk interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set interface all
```

To enable MVRP on a specific trunk interface:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0
```

Disabling MVRP

MVRP is disabled by default. You only need to perform this procedure if you have previously enabled MVRP.

To disable MVRP on all trunk interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set disable
```

To disable MVRP on a specific trunk interface:

```
[edit protocols mvrp]
user@switch# set disable interface xe-0/0/1.0
```

Disabling Dynamic VLANs

Dynamic VLANs can be created on interfaces participating in MVRP by default. Dynamic VLANs are VLANs created on one switch that are propagated to other switches dynamically; in this case, using MVRP.

Dynamic VLAN creation through MVRP cannot be disabled per switch interface. To disable dynamic VLAN creation for interfaces participating in MVRP, you must disable it for all interfaces on the switch.

To disable dynamic VLAN creation:

```
[edit protocols mvrp]
user@switch# set no-dynamic-vlan
```

Configuring Timer Values

The timers in MVRP define the amount of time an interface waits to join or leave MVRP or to send or process the MVRP information for the switch after receiving an MVRP PDU. The join timer controls the amount of time the switch waits to accept a registration request, the leave timer controls the period of time that the switch waits in the Leave state before changing to the unregistered state, and the leaveall timer controls the frequency with which the LeaveAll messages are communicated.

The default MVRP timer values are 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms for the leaveall timer.

BEST PRACTICE: Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

To set the join timer for all interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set interface all join-timer 300
```

To set the join timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 300
```

To set the leave timer for all interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set interface all leave-timer 1200
```

To set the leave timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 leave-timer 1200
```

To set the leaveall timer for all interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set interface all leaveall-timer 12000
```

To set the leaveall timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 leaveall-timer 12000
```

Configuring MVRP Registration Mode

The default MVRP registration mode for any interface participating in MVRP is normal. An interface in normal registration mode participates in MVRP when MVRP is enabled on the switch.

An interface in forbidden registration mode does not participate in MVRP even if MVRP is enabled on the switch.

To set all interfaces to forbidden registration mode:

```
[edit protocols mvrp]
user@switch# set interface all registration forbidden
```

To set one interface to forbidden registration mode:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 registration forbidden
```

To set all interfaces to normal registration mode:

```
[edit protocols mvrp]
user@switch# set interface all registration normal
```

To set one interface to normal registration mode:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 registration normal
```

Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure)

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to J-EX Series switches at a remote location. This feature is useful when you have a network that includes remote sites that are connected across a service provider network and you want to run Layer 2 protocols on switches connected across the service provider network.

Tunneled Layer 2 PDUs do not normally arrive at high rate. If the tunneled Layer 2 PDUs do arrive at high rate, there might be a problem in the network. Typically, you would want to shut down the interface that is receiving a high rate of tunneled Layer 2 PDUs so that the problem can be isolated. You do so using the **shutdown-threshold** statement. However, if you do not want to completely shut down the interface, you can configure the switch to drop tunneled Layer 2 PDUs that exceed a certain threshold using the **drop-threshold** statement.

There are no default settings for **drop-threshold** and **shutdown-threshold**. If you do not specify these thresholds, then no thresholds are enforced. As a result, the switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

You can specify a drop threshold value without specifying a shutdown threshold value, and you can specify a shutdown threshold value without specifying a drop threshold value. If you specify both threshold values, then the drop threshold value must be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit will fail.

NOTE: If the switch receives untagged Layer 2 control PDUs to be tunnelled, then you must configure the switch to map untagged (native) packets to an L2PT-enabled VLAN. Otherwise, the untagged Layer 2 control PDU packets are discarded. For more information, see “Understanding Q-in-Q Tunneling on J-EX Series Switches” on page 1051 and “Configuring Q-in-Q Tunneling (CLI Procedure)” on page 1144.

To configure L2PT on a J-EX Series switch:

1. Because L2PT operates under the Q-in-Q tunneling configuration, you must enable Q-in-Q tunneling before you can configure L2PT. Enable Q-in-Q tunneling on VLAN **customer-1**:

   ```
   [edit]
   user@switch# set vlans customer-1 dot1q-tunneling
   ```

2. Enable L2PT for the Layer 2 protocol you want to tunnel, on the VLAN:

   - To enable L2PT for a specific protocol (here, STP):

     ```
     [edit]
     user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
     ```

- To enable L2PT for all supported protocols:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling all
```

3. (Optional) Configure the drop threshold:

> NOTE: If you also configure the shutdown threshold, ensure that you configure the drop threshold value to be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you to try to commit the configuration changes, the commit will fail.

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2–protocol-tunneling stp
drop-threshold 50
```

4. (Optional) Configure the shutdown threshold:

> NOTE: If you also configure the drop threshold, ensure that you configure the shutdown threshold value to be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value and you to try to commit the configuration changes, the commit will fail.

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2–protocol-tunneling stp
shutdown-threshold 100
```

> NOTE: Once an interface is disabled, you must explicitly reenable it using the clear ethernet-switching layer2-protocol-tunneling error command. Otherwise, the interface remains disabled.

Configuring MAC Notification (CLI Procedure)

When a switch learns or unlearns a MAC address, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as MAC notification.

The MAC notification interval defines how often Simple Network Management Protocol (SNMP) notifications logging the addition or removal of MAC addresses on the switch are sent to the network management system.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

To enable or disable MAC notification, or to set the MAC notification interval, perform these tasks:

- Enabling MAC Notification on page 1152
- Disabling MAC Notification on page 1152
- Setting the MAC Notification Interval on page 1152

Enabling MAC Notification

MAC notification is disabled by default. You need to perform this procedure to enable MAC notification.

To enable MAC notification on the switch with the default MAC notification interval of 30 seconds:

```
[edit ethernet-switching-options]
user@switch# set mac-notification
```

To enable MAC notification on the switch with any other MAC notification interval (here, the MAC notification interval is set to 60 seconds):

```
[edit ethernet-switching-options]
user@switch# set mac-notification notification-interval 60
```

Disabling MAC Notification

MAC notification is disabled by default. Perform this procedure only if MAC notification was previously enabled on your switch.

To disable MAC notification on the switch:

```
[edit ethernet-switching-options]
user@switch# delete mac-notification
```

Setting the MAC Notification Interval

The default MAC notification interval is 30 seconds. The procedure to change the MAC notification interval to a different interval is identical to the procedure to enable MAC notification on the switch with a nondefault value for the MAC notification interval.

To set the MAC notification interval on the switch (here, the MAC notification interval is set to 5 seconds):

```
[edit ethernet-switching-options]
user@switch# set mac-notification notification-interval 5
```

Related Documentation

- Verifying that MAC Notification Is Working Properly on page 1163

Configuring Proxy ARP (CLI Procedure)

You can configure proxy Address Resolution Protocol (ARP) on your J-EX Series switch to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:

```
[edit interfaces]
user@switch# set ge-0/0/3 unit 0 proxy-arp restricted
```

BEST PRACTICE: We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch is not a proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid the situation of the switch's response to a gratuitous ARP request appearing to the host to be an indication of an IP conflict:

To configure proxy ARP on a routed VLAN interface (RVI):

```
[edit interfaces]
user@switch# set vlan unit 100 proxy-arp restricted
```

Related Documentation

- Example: Configuring Proxy ARP on a J-EX Series Switch on page 2621
- Verifying That Proxy ARP Is Working Correctly on page 1164
- Configuring Routed VLAN Interfaces (CLI Procedure) on page 1137

CHAPTER 60

Verifying Bridging and VLAN Configuration

Verifying That a Series of Tagged VLANs Has Been Created

Purpose Verify that a series of tagged VLANs is created on the switch.

Action Display the VLANs in the ascending order of their VLAN ID:

```
user@switch> show vlans sort-by tag

Name              Tag         Interfaces
__employee_120__  120
                              ge-0/0/22.0*
__employee_121__  121
                              ge-0/0/22.0*
__employee_122__  122
                              ge-0/0/22.0*
__employee_123__  123
                              ge-0/0/22.0*
__employee_124__  124
                              ge-0/0/22.0*
__employee_125__  125
                              ge-0/0/22.0*
__employee_126__  126
                              ge-0/0/22.0*
__employee_127__  127
                              ge-0/0/22.0*
__employee_128__  128
                              ge-0/0/22.0*
__employee_129__  129
                              ge-0/0/22.0*
```

```
__employee_130__  130
                              ge-0/0/22.0*
```

Display the VLANs by the alphabetical order of the VLAN name:

```
user@switch>  show vlans sort-by name

Name             Tag   Interfaces

__employee_120__ 120
                       ge-0/0/22.0*
__employee_121__ 121
                       ge-0/0/22.0*
__employee_122__ 122
                       ge-0/0/22.0*
__employee_123__ 123
                       ge-0/0/22.0*
__employee_124__ 124
                       ge-0/0/22.0*
__employee_125__ 125
                       ge-0/0/22.0*
__employee_126__ 126
                       ge-0/0/22.0*
__employee_127__ 127
                       ge-0/0/22.0*
__employee_128__ 128
                       ge-0/0/22.0*
__employee_129__ 129
                       ge-0/0/22.0*
__employee_130__ 130
                       ge-0/0/22.0*
```

Display the VLANs by specifying the VLAN-range name (here, the VLAN-range name is **employee**):

```
user@switch>  show vlans employee

Name             Tag   Interfaces

__employee_120__ 120
                       ge-0/0/22.0*
__employee_121__ 121
                       ge-0/0/22.0*
__employee_122__ 122
                       ge-0/0/22.0*
__employee_123__ 123
                       ge-0/0/22.0*
__employee_124__ 124
                       ge-0/0/22.0*
__employee_125__ 125
                       ge-0/0/22.0*
__employee_126__ 126
                       ge-0/0/22.0*
__employee_127__ 127
                       ge-0/0/22.0*
__employee_128__ 128
                       ge-0/0/22.0*
__employee_129__ 129
                       ge-0/0/22.0*
```

```
__employee_130__ 130
                        ge-0/0/22.0*
```

Meaning The sample output shows the VLANs configured on the switch. The series of tagged VLANs is displayed: **__employee_120__** through **__employee_130__**. Each of the tagged VLANs is configured on the trunk interface **ge-0/0/22.0**. The asterisk (*****) beside the interface name indicates that the interface is **UP**.

When a series of VLANs is created using the **vlan-range** statement, the VLAN names are prefixed and suffixed with a double underscore.

Related Documentation

- Creating a Series of Tagged VLANs (CLI Procedure) on page 1140

Verifying That Virtual Routing Instances Are Working

Purpose After creating a virtual routing instance, make sure it is set up properly.

Action

1. Use the **show route instance** command to list all of the routing instances and their properties:

```
user@switch> show route instance

Instance             Type
         Primary RIB
Active/holddown/hidden
master               forwarding
         inet.0                                          3/0/0

__juniper_private1__ forwarding
         __juniper_private1__.inet.0                     1/0/3

__juniper_private2__ forwarding

instance1            forwarding

r1                   virtual-router
         r1.inet.0                                       1/0/0

r2                   virtual-router
         r2.inet.0                                       1/0/0
```

2. Use the **show route forwarding-table** command to view the forwarding table information for each routing instance:

```
user@switch> show route forwarding-table

Routing table: r1.inet
Internet:
Destination        Type RtRef Next hop           Type Index NhRef Netif
default            perm     0                    rjct   539     2
0.0.0.0/32         perm     0                    dscd   537     1
103.1.1.0/24       ifdn     0                    rslv   579     1
ge-0/0/3.0
103.1.1.0/32       iddn     0 103.1.1.0          recv   577     1
ge-0/0/3.0
103.1.1.1/32       user     0                    rjct   539     2
103.1.1.1/32       intf     0 103.1.1.1          locl   578     2
```

```
103.1.1.1/32       iddn     0 103.1.1.1          locl   578     2
103.1.1.255/32     iddn     0 103.1.1.255        bcst   576     1
ge-0/0/3.0
224.0.0.0/4        perm     0                    mdsc   538     1
224.0.0.1/32       perm     0 224.0.0.1          mcst   534     1
255.255.255.255/32 perm     0                    bcst   535     1
```

Meaning The output confirms that the virtual routing instances are created and the links are up and displays the routing table information.

Related Documentation

- Configuring Virtual Routing Instances (CLI Procedure) on page 1142
- Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches on page 1112

Verifying That Q-in-Q Tunneling Is Working

Purpose After creating a Q-in-Q VLAN, verify that it is set up properly.

Action

1. Use the **show configuration vlans** command to determine if you successfully created the primary and secondary VLAN configurations:

```
user@switch> show configuration vlans

svlan {
   vlan-id 300;
   dot1q-tunneling {
      customer-vlans [ 101–200 ];
   }
}
```

2. Use the **show vlans** command to view VLAN information and link status:

```
user@switch> show vlans s-vlan-name extensive

VLAN: svlan, Created at: Thu Oct 23 16:53:20 2008
802.1Q Tag: 300, Internal index: 2, Admin State: Enabled, Origin: Static
Dot1q Tunneling Status: Enabled
Customer VLAN ranges:
                     101–200
Protocol: Port Mode
Number of interfaces: Tagged 1 (Active = 0), Untagged  1 (Active = 0)
      ge-0/0/1, tagged, trunk
      ge-0/0/2, untagged, access
```

Meaning The output confirms that Q-in-Q tunnling is enabled and that the VLAN is tagged, and lists the customer VLANs that are associated with the tagged VLAN.

Related Documentation

- Configuring Q-in-Q Tunneling (CLI Procedure) on page 1144
- Example: Setting Up Q-in-Q Tunneling on J-EX Series Switches on page 1105

Verifying That a Private VLAN Is Working

Purpose After creating and configuring private VLANs, verify they are set up properly.

Action

1. Use the **show configuration vlans** command to determine if you successfully created the primary and secondary VLAN configurations:

```
user@switch> show configuration vlans

community1 {
    interface {
        interface a;
        interface b;
    }
    primary-vlan pvlan;
}
community2 {
    interface {
        interface d;
        interface e;
    }
    primary-vlan pvlan;
}
pvlan {
    vlan-id 1000;
    interface {
        isolated1;
        isolated2;
        trunk1;
        trunk2;
    }
    no-local-switching;
}
```

2. Use the **show vlans** command to view VLAN information and link status:

```
user@switch> show vlans pvlan extensive

VLAN: pvlan, Created at: time
802.1Q Tag: vlan-id, Internal index: index-number, Admin State: Enabled,
 Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged  6 (Active = 0)
      trunk1, tagged, trunk
      interface a, untagged, access
      interface b, untagged, access
      interface c, untagged, access
      interface d, untagged, access
      interface e, untagged, access
      interface f, untagged, access
      trunk2, tagged, trunk
Secondary VLANs: Isolated 2, Community  2
  Isolated VLANs :
      __pvlan_pvlan_isolated1__
      __pvlan_pvlan_isolated2__
  Community VLANs :
      community1
      community2
```

3. Use the **show ethernet-switching table vlan** command to view logs for MAC learning on the VLANs:

```
user@switch> vlan pvlan extensive

pvlan, *
  Interface(s): trunk1
  Interface(s): interface a
  Interface(s): interface b
  Interface(s): interface c
  Interface(s): interface d
  Interface(s): interface e
  Interface(s): interface f
  Interface(s): trunk2
  Type: Flood
  Nexthop index: 1344
```

Meaning The output shows that the primary and secondary VLANs were created and associated and displays MAC learning information.

Related Documentation

- Creating a Private VLAN (CLI Procedure) on page 1143
- Example: Configuring a Private VLAN on a J-EX Series Switch on page 1107

Monitoring Ethernet Switching

Purpose Use the monitoring feature to view details that the J-EX Series switch maintains in its Ethernet switching table. These are details about the nodes on the LAN such as VLAN name, VLAN ID, member interfaces, MAC addresses, and so on.

Action To display Ethernet switching details in the J-Web interface, select **Monitor > Switching > Ethernet Switching**.

To view Ethernet switching details in the CLI, enter the following commands:

- **show ethernet-switching table**
- **show vlans**
- **show ethernet-switching interfaces**

Meaning Table 153 on page 1160 summarizes the Ethernet switching output fields.

Table 153: Ethernet Switching Output Fields

Field	Value
Ethernet Switching Table Information	
MAC Table Count	The number of entries added to the Ethernet switching table.
MAC Table Learned	The number of dynamically learned MAC addresses in the Ethernet switching table.
Ethernet Switching Table Information	

Table 153: Ethernet Switching Output Fields *(continued)*

Field	Value
VLAN	The VLAN name.
MAC Address	The MAC address associated with the VLAN. If a VLAN range has been configured for a VLAN, the output displays the MAC addresses for the entire series of VLANs that were created with that name.
Type	The type of MAC address. Values are: • **static**—The MAC address is manually created. • **learn**—The MAC address is learned dynamically from a packet's source MAC address. • **flood**—The MAC address is unknown and flooded to all members.
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.
Interfaces	The associated interfaces.
MAC Learning Log	
VLAN-Name	The VLAN name.
MAC Address	The learned MAC address associated with the VLAN ID.
Time	Timestamp for the time at which when the MAC address was added or deleted from the MAC learning log.
State	Operating state of the interface. Values are **Up** and **Down**.

Related Documentation

- Configuring MAC Table Aging (CLI Procedure) on page 1138
- Understanding Bridging and VLANs on J-EX Series Switches on page 1041

Monitoring GVRP

Purpose Use the monitoring feature to view information about the GVRP configuration on the J-EX Series switch.

Action To monitor GVRP in the J-Web interface, select **Monitor > Switching > GVRP**.

To monitor GVRP in the CLI, enter the following command:

- **show gvrp**

Meaning Table 154 on page 1162 summarizes the GVRP output fields.

Table 154: Summary of GVRP Output Fields

Field	Value
Global GVRP Configuration	
GVRP Status	Displays whether GVRP is enabled or disabled.
GVRP Timers	• Join—The number of milliseconds the interfaces must wait before sending VLAN advertisements. • Leave—The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message. • Leave All—The interval in milliseconds at which Leave All messages are sent on interfaces. Leave All messages maintain current GVRP VLAN membership information in the network.
GVRP Interface Details	
Interface Name	The interface on which GVRP is configured.
Protocol Status	Displays whether GVRP is enabled or disabled on the interface.

Related Documentation

- Configuring GVRP (J-Web Procedure) on page 1144
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

Verifying That MVRP Is Working Correctly

Purpose After configuring your J-EX Series switch to participate in MVRP, verify that the configuration is properly set and that MVRP messages are being sent and received on your switch.

Action

1. Confirm that MVRP is enabled on your switch.

```
user@switch> show mvrp

Global MVRP configuration
  MVRP status               : Enabled
  MVRP dynamic vlan creation: Enabled
  MVRP Timers (ms):
   Interface        Join   Leave   LeaveAll
   --------------   ----   -----   --------
   all              200    600     10000
   xe-0/1/1.0       200    600     10000

  Interface based configuration:
   Interface        Status     Registration   Dynamic VLAN Creation
   --------------   --------   ------------   ---------------------
   all          Disabled   Fixed          Enabled
   xe-0/1/1.0       Enabled    Normal         Enabled
```

2. Confirm that MVRP messages are being sent and received on your switch.

```
user@switch> show mvrp statistics interface xe-0/1/1.0
```

```
MVRP statistics
  MRPDU received                : 3342
  Invalid PDU received          : 0
  New received                  : 2
  Join Empty received           : 1116
  Join In received              : 2219
  Empty received                : 2
  In received                   : 2
  Leave received                : 1
  LeaveAll received             : 1117
  MRPDU transmitted             : 3280
  MRPDU transmit failures       : 0
  New transmitted               : 0
  Join Empty transmitted        : 1114
  Join In transmitted           : 2163
  Empty transmitted             : 1
  In transmitted                : 1
  Leave transmitted             : 1
  LeaveAll transmitted          : 1111
```

Meaning The output of **show mvrp** shows that interface **xe-0/1/1.0** is enabled for MVRP participation as shown in the status in the **Interface based configuration** field.

The output for **show mvrp statistics interface xe-0/1/1.0** confirms that MVRP messages are being transmitted and received on the interface.

Verifying That MAC Notification Is Working Properly

Purpose Verify that MAC notification is enabled or disabled, and that the MAC notification interval is set to the specified value.

Action Verify that MAC notification is enabled while also verifying the MAC notification interval setting.

```
user@switch> show ethernet-switching mac-notification
Notification Status: Enabled
Notification Interval: 30
```

Meaning The output in the **Notification Status** field shows that MAC notification is enabled. The output in the **Notification Status** field would display **Disabled** if MAC notification was disabled.

The **Notification Interval** field output shows that the MAC notification interval is set to 30 seconds.

Related Documentation

- Configuring MAC Notification (CLI Procedure) on page 1151

Verifying That Proxy ARP Is Working Correctly

Purpose Verify that the switch is sending proxy ARP messages.

Action List the system statistics for ARP:

```
user@switch> show system statistics arp
arp:
        198319 datagrams received
        45 ARP requests received
        12 ARP replies received
        2 resolution requests received
        2 unrestricted proxy requests
        0 restricted proxy requests
        0 received proxy requests
        0 proxy requests not proxied
        0 restricted-proxy requests not proxied
        0 with bogus interface
        0 with incorrect length
        0 for non-IP protocol
        0 with unsupported op code
        0 with bad protocol address length
        0 with bad hardware address length
        0 with multicast source address
        0 with multicast target address
        0 with my own hardware address
        168705 for an address not on the interface
        0 with a broadcast source address
        0 with source address duplicate to mine
        29555 which were not for me
        0 packets discarded waiting for resolution
        4 packets sent after waiting for resolution
        27 ARP requests sent
        47 ARP replies sent
        0 requests for memory denied
        0 requests dropped on entry
        0 requests dropped during retry
        0 requests dropped due to interface deletion
        0 requests on unnumbered interfaces
        0 new requests on unnumbered interfaces
        0 replies for from unnumbered interfaces
        0 requests on unnumbered interface with non-subnetted donor
        0 replies from unnumbered interface with non-subnetted donor
```

Meaning The statistics show that two proxy ARP requests were received, and the **proxy requests not proxied** field indicates that all the unproxied ARP requests received have been proxied by the switch.

CHAPTER 61

Troubleshooting Bridging and VLAN Configuration

Troubleshooting Ethernet Switching

Troubleshooting issues for Ethernet switching on J-EX Series switches:

MAC Address in the Switch's Ethernet Switching Table Is Not Updated After a MAC Address Move

Problem Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table. However, sometimes silent devices, such as SYSLOG servers or SNMP Trap receivers that receive UDP traffic but do not return acknowledgement (ACK) messages to the traffic source, do not send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

Solution Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the timer is from 1 through 240 minutes.)

   ```
   [edit system arp]
   user@switch# set aging-timer 3
   ```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP, thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table

arp

Syntax

```
arp {
  aging-timer minutes;
}
```

Hierarchy Level [edit system]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Set the time interval between ARP updates.

Options

aging-timer *minutes*—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high, increasing the time between updates can improve system performance.

Range: 5 to 240 minutes

Default: 20 minutes

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- For more information about ARP updates, see the *Junos OS System Basics Configuration Guide* at http://www.juniper.net/techpubs/software/junos/.

bridge-priority

Syntax bridge-priority *priority*;

Hierarchy Level [edit protocols **mstp**],
[edit protocols **mstp msti** *msti-id*],
[edit protocols **rstp**],
[edit protocols **stp**],
[edit protocols **vstp vlan** *vlan-id*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.

Default 32,768

Options ***priority***—Bridge priority. It can be set only in increments of 4096.

Range: 0 through 61,440

Default: 32,768

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Understanding VSTP for J-EX Series Switches on page 1281

customer-vlans

Syntax customer-vlans (*id* | native | *range*);

Hierarchy Level [edit **vlans** *vlan-name* **dot1q-tunneling**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Limit the set of accepted C-VLAN tags to a range or to discrete values.

Options ***id***—Numeric identifier for a VLAN.

native—Accepts untagged and priority-tagged packets from access interfaces and assigns the configured S-VLAN to the packet.

range—Range of numeric identifiers for VLANs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

description

Syntax description *text-description*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
Option **text-description** enhanced from supporting up to 128 characters to supporting up to 256 characters in Junos OS Release 10.2 for J-EX Series switches.

Description Provide a textual description of the VLAN. The text has no effect on the operation of the VLAN or switch.

Options ***text-description***—Text to describe the interface. It can contain letters, numbers, and hyphens (-) and can be up to 256 characters long. If the text includes spaces, enclose the entire text in quotation marks.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show vlans on page 1263**
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 1063

disable

Syntax disable;

Hierarchy Level [edit protocols **gvrp**],
[edit protocols **gvrp interface** [*interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

NOTE: GVRP can be enabled only on trunk interfaces.

Description Disable the GVRP configuration on the interface.

Default If you do not configure GVRP, it is disabled. You can use this command to disable a prior configuration of GVRP on a specified interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show gvrp on page 1253**
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

disable (MVRP)

Syntax disable;

Hierarchy Level [edit protocols **mvrp**],
[edit protocols **mvrp interface**(all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the MVRP configuration on the interface.

Default MVRP is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147

dot1q-tunneling (Ethernet Switching)

Syntax
```
dot1q-tunneling {
  ether-type (0x8100 | 0x88a8 | 0x9100);
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.
The remaining statement is explained separately.

Description Set a global value for the Ethertype for Q-in-Q tunneling.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **dot1q-tunneling on page 1186**
- Example: Setting Up Q-in-Q Tunneling on J-EX Series Switches on page 1105
- Configuring Q-in-Q Tunneling (CLI Procedure) on page 1144

dot1q-tunneling (VLANs)

Syntax

```
dot1q-tunneling {
  customer-vlans (id | native | range);
  layer2-protocol-tunneling all | protocol-name {
    drop-threshold number;
    shutdown-threshold number;
  }
}
```

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable Q-in-Q tunneling on the specified VLAN.

NOTE: The VLAN on which you enable Q-in-Q tunneling must be a tagged VLAN.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring Q-in-Q Tunneling (CLI Procedure) on page 1144
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 1051

drop-threshold

Syntax drop-threshold *number*;

Hierarchy Level [edit vlans *vlan-name* dot1q-tunneling layer2-protocol-tunneling all | *protocol-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs. The drop threshold value must be less than or equal to the shutdown threshold value.

NOTE: If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit will fail.

You can specify a drop threshold value without specifying a shutdown threshold value.

Default No drop threshold is specified.

Options *number*—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs.

Range: 1 through 1000

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **shutdown-threshold on page 1220**
- Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches on page 1126
- Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure) on page 1150

ether-type

Syntax ether-type (0x8100 | 0x88a8 | 0x9100)

Hierarchy Level [edit **ethernet-switching-options dot1q-tunneling**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a global value for the Ethertype. Only one Ethertype value is supported at a time. The Ethertype value appears in the Ethernet type field of the packet. It specifies the protocol being transported in the Ethernet frame.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

      interface (all | [interface-name | access-ports]) {
        vlan vlan-name ;
        forwarding-class <assured-forwarding | best-effort | expedited-forwarding |
          network-control>;
      }
    }
  }
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Ethernet switching options.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

filter

Syntax filter (input | output) *filter-name*;

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Apply a firewall filter to traffic coming into or exiting from the VLAN.

Default All incoming traffic is accepted unmodified to the VLAN, and all outgoing traffic is sent unmodified from the VLAN.

Options ***filter-name*** —Name of a firewall filter defined in a **filter** statement.

- **input**—Apply a firewall filter to VLAN ingress traffic.
- **output**—Apply a firewall filter to VLAN egress traffic.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

group-name

Syntax

```
group-name name {
  interface interface-name <primary>;
  interface interface-name;
}
```

Hierarchy Level [edit ethernet-switching-options redundant-trunk-group]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Create a redundant trunk group.

Options *name*—The name of the redundant trunk group. The group name must start with a letter and can consist of letters, numbers, dashes, and underscores.

The remaining options are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

gvrp

Syntax

```
gvrp {
  interface [interface-name] {
    disable;
  }
  join-timer milliseconds;
  leave-timer milliseconds;
  leaveall-timer milliseconds;
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

NOTE: GVRP can be enabled only on trunk interfaces.

Description When GVRP is configured on a trunk interface, it ensures that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs.

The statements are explained separately.

Default GVRP is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show gvrp on page 1253**
- Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches on page 1070
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

instance-type

Syntax instance-type virtual-router

Hierarchy Level [edit routing-instances]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the type of routing instance.

Options **virtual-router**—A logical entity.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches on page 1112
- Configuring Virtual Routing Instances (CLI Procedure) on page 1142

interface

Syntax
```
interface (all | [interface-name]) {
    <enable | disable>;
}
```

Hierarchy Level [edit protocols gvrp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure GARP VLAN Registration Protocol (GVRP) for one or more interfaces.

Default By default, GVRP is disabled.

Options **all**—All interfaces.

interface-name—The list of interfaces to be configured for GVRP.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show gvrp on page 1253**
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

interface (MVRP)

Syntax

```
interface (all | interface-name) {
    disable;
    join-timer milliseconds;
    leave-timer milliseconds;
    leaveall-timer milliseconds;
    registration (forbidden | normal);
}
```

Hierarchy Level [edit protocols mvrp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify interfaces on which to configure Multiple VLAN Registration Protocol (MVRP).

Default By default, MVRP is disabled.

Options **all**—All interfaces on the switch.

interface-name—Names of interface to be configured for MVRP.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 1115
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147

interface

Syntax
interface *interface-name* <primary>;
interface *interface-name*;

Hierarchy Level
[edit **ethernet-switching-options redundant-trunk-group group-name** *name*]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Configure a primary link and secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over as the primary link without waiting for normal STP convergence.

Options
interface *interface-name*—A logical interface or an aggregated interface containing multiple ports.

primary—(Optional) Specify one of the interfaces in the redundant group as the primary link. The interface without this option is the secondary link in the redundant group. If a link is not specified as **primary**, the software compares the two links and selects the link with the highest port number as the active link. For example, if the two interfaces are **ge-0/1/0** and **ge-0/1/1**, the software assigns **ge-0/1/1** as the active link.

Required Privilege Level
routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Configuring Redundant Trunk Links for Faster Recovery on page 1101
- Understanding Redundant Trunk Links on J-EX Series Switches on page 1049

interface

Syntax
interface *interface-name*;

Hierarchy Level
[edit **routing-instances**]

Release Information
Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
For virtual routing instances, configure an interface.

Options
interface-name—Name of a Gigabit Ethernet interface.

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches on page 1112
- Configuring Virtual Routing Instances (CLI Procedure) on page 1142
- Understanding Virtual Routing Instances on J-EX Series Switches on page 1048

interface

Syntax

```
interface interface-name {
  mapping (native (push | swap) | policy | tag (push | swap));
}
```

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For a specific VLAN, configure an interface.

Options ***interface-name***—Name of a Gigabit Ethernet interface.

The remaining statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 1063
- Configuring VLANs for J-EX Series Switches (CLI Procedure) on page 1136
- Understanding Bridging and VLANs on J-EX Series Switches on page 1041
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 1051

interfaces

Syntax

```
interfaces interface-name {
  no-mac-learning;
}
```

Hierarchy Level [edit ethernet-switching-options]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure settings for interfaces that have been assigned to family **ethernet-switching**.

Options ***interface-name*** --Name of an interface that is configured for **family ethernet-switching**.

The remaining statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 1051

join-timer

Syntax join-timer *milliseconds*;

Hierarchy Level [edit protocols gvrp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For GARP VLAN Registration Protocol (GVRP), configure the maximum number of milliseconds interfaces must wait before sending VLAN advertisements.

Default 20 milliseconds

Options ***milliseconds*** —Number of milliseconds.
Default: 20 milliseconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show gvrp on page 1253**
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

join-timer (MVRP)

Syntax join-timer *milliseconds*;

Hierarchy Level [edit protocols **mvrp interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the maximum number of milliseconds interfaces must wait before sending Multiple VLAN Registration Protocol (MVRP) protocol data units (PDUs).

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Default 200 milliseconds

Options ***milliseconds***—Number of milliseconds that the interface must wait before sending MVRP PDUs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **leaveall-timer on page 1206**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 1115
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147

l3-interface

Syntax l3-interface vlan.*logical-interface-number*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Associate a Layer 3 interface with the VLAN. Configure Layer 3 interfaces on trunk ports to allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

Default No Layer 3 (routing) interface is associated with the VLAN.

Options vlan.*logical-interface-number*—Number of the logical interface defined with a **set interfaces vlan unit** command. For the logical interface number, use the same number you configure in the **unit** statement.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

layer2-protocol-tunneling

Syntax

```
layer2-protocol-tunneling all | protocol-name {
    drop-threshold number;
    shutdown-threshold number;
}
```

Hierarchy Level [edit vlans *vlan-name* **dot1q-tunneling**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable Layer 2 protocol tunneling (L2PT) on the VLAN.

The remaining statements are explained separately.

Default L2PT is not enabled.

Options **all**—Enable all supported Layer 2 protocols.

protocol-name—Name of the Layer 2 protocol. Values are:

- **802.1x**—IEEE 802.1X authentication
- **802.3ah**—IEEE 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM)

  NOTE: If you enable L2PT for untagged OAM LFM packets, do not configure LFM on the corresponding access interface.

- **cdp**—Cisco Discovery Protocol
- **e-lmi**—Ethernet local management interface
- **gvrp**—GARP VLAN Registration Protocol
- **lacp**—Link Aggregation Control Protocol

  NOTE: If you enable L2PT for untagged LACP packets, do not configure LACP on the corresponding access interface.

- **llpd**—Link Layer Discovery Protocol
- **mmrp**—Multiple MAC Registration Protocol
- **mvrp**—Multiple VLAN Registration Protocol
- **stp**—Spanning Tree Protocol, Rapid Spanning Tree Protocol, and Multiple Spanning Tree Protocol
- **vstp**—VLAN Spanning Tree Protocol
- **vtp**—VLAN Trunking Protocol

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches on page 1126
- Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure) on page 1150

leave-timer

Syntax leave-timer *milliseconds*;

Hierarchy Level [edit protocols **gvrp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For GARP VLAN Registration Protocol (GVRP), configure the number of milliseconds an interface waits after receiving a leave message before the interface leaves the VLAN specified in the message. If the interface receives a join message before the timer expires, the software keeps the interface in the VLAN.

Default 60 centiseconds

Options ***milliseconds*** —Number of milliseconds. At a minimum, the leave timer interval should be twice the join timer interval.
Default: 60 centiseconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- **show gvrp on page 1253**
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

leave-timer (MVRP)

Syntax leave-timer *milliseconds*;

Hierarchy Level [edit protocols **mvrp interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Multiple VLAN Registration Protocol (MVRP), configure the number of milliseconds the switch retains a VLAN in the Leave state before the VLAN is unregistered. If the interface receives a join message before this timer expires, the VLAN remains registered.

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Default 1000 milliseconds

Options ***milliseconds***—Number of milliseconds that the switch retains a VLAN in the Leave state before the VLAN is unregistered. At a minimum, set the leave-timer interval at twice the join-timer interval.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **join-timer on page 1200**
- **leaveall-timer on page 1206**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 1115
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147

leaveall-timer

Syntax leaveall-timer *milliseconds*;

Hierarchy Level [edit protocols **gvrp**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For GARP VLAN Registration Protocol (GVRP), configure the interval at which Leave All messages are sent on the interfaces. Leave All messages maintain current GVRP VLAN membership information in the network. A Leave All message instructs the port to change the GVRP state for all its VLANs to a leaving state and remove them unless a Join message is received before the leave timer expires.

Default 1000 centiseconds

Options ***milliseconds*** —Number of milliseconds.

Range: 5 times **leave-timer** value

Default: 1000 centiseconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show gvrp on page 1253**
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

leaveall-timer (MVRP)

Syntax leaveall-timer *milliseconds*;

Hierarchy Level [edit protocols **mvrp interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For Multiple VLAN Registration Protocol (MVRP), configure the interval at which the LeaveAll state operates on the interface.

Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

Default 10000 milliseconds

Options ***milliseconds***—Number of milliseconds between the sending of Leave All messages.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **join-timer on page 1200**
- **leave-timer on page 1204**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 1115
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147

mac-limit

Syntax mac-limit *number*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the number of MAC addresses allowed on a VLAN.

The number of MAC addresses allowed per VLAN varies between J-EX switches. The output of the **set vlans *vlan-name* mac-limit ?** provides the number of MAC addresses allowed on your J-EX switch.

Default MAC limit is disabled.

Options *number*—Maximum number of MAC addresses.
Range: 1 through 32768.

NOTE: Do not set **mac-limit** to 1. The first learned MAC address is often inserted into the forwarding database automatically (for instance, for routed VLAN Interfaces (RVIs), the first MAC address inserted into the forwarding database is the MAC address of the RVI. For aggregated Ethernet bundles using LACP, the first MAC address inserted into the forwarding database in the forwarding table is the source address of the protocol packet). The switch will therefore not learn MAC addresses other than the automatic addresses when the **mac-limit** is set to 1, and this will cause problems with MAC learning and forwarding.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show vlans on page 1263**
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 1063

mac-notification

Syntax

```
mac-notification {
  notification-interval seconds;
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Enable MAC notification for a switch. If you configure this statement without setting a notification interval, MAC notification is enabled with the default MAC notification interval of 30 seconds.

The remaining statement is explained separately.

Default MAC notification is disabled by default.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring MAC Notification (CLI Procedure) on page 1151

mac-table-aging-time

Syntax mac-table-aging-time *seconds*;

Hierarchy Level [edit **ethernet-switching-options**],
[edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Define how long entries remain in the Ethernet switching table before expiring:

- If you specify this statement at the **[edit ethernet-switching-options]** hierarchy level, it applies to all VLANs on the switch.
- If you specify this statement at the **[edit vlans]** hierarchy level, it applies to the specified VLAN.

Default Entries remain in the Ethernet switching table for 300 seconds

Options ***seconds***—Time that entries remain in the Ethernet switching table before being removed.

- **Range**—60 through 1,000,000 seconds
- **Default**—300 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **show ethernet-switching statistics aging on page 1244**
- Example: Setting Up Basic Bridging and a VLAN for a J-EX Series Switch on page 1063
- Configuring MAC Table Aging (CLI Procedure) on page 1138

- Understanding Bridging and VLANs on J-EX Series Switches on page 1041

mapping

Syntax **mapping** (native (push | swap) | policy | *tag* (push | swap));

Hierarchy Level [edit **vlans** *vlan-name* **interface** *interface-name* ingress]:
[edit **vlans** *vlan-name* **interface** *interface-name* egress]:
[edit **vlans** *vlan-name* **interface** *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Map a specific C-VLAN to an S-VLAN. By default, the received incoming or outgoing tag is replaced with the new tag.

This statement is also required if you are configuring firewall filters to map traffic from an interface to a VLAN. If you are configuring firewall filters to map traffic from an interface to a VLAN, the **mapping policy** option must be configured using this command. The firewall filter also has to be configured using the **vlan** action for a match condition in the firewall filter stanza for firewall filters to map traffic from an interface for a VLAN.

Options

native—Maps untagged and priority-tagged packets to an S-VLAN.

policy—Maps the interface to a firewall filter policy to an S-VLAN.

push—Retains the incoming tag and add an additional VLAN tag instead of replacing the original tag.

swap—Swaps the incoming VLAN tag with the VLAN ID tag of the S-VLAN. Use of this option is also referred to as VLAN ID translation.

tag—Retains the incoming 802.1Q tag on the interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring VLANs for J-EX Series Switches (CLI Procedure) on page 1136
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 1051

members

Syntax members [(all | *names* | *vlan-ids*)];

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number* **family ethernet-switching vlan**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description For trunk interfaces, configure the VLANs for which the interface can carry traffic.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Options **all**—Specifies that this trunk interface is a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

NOTE: Each VLAN that is configured must have a specified VLAN ID when you attempt to commit the configuration; otherwise, the configuration commit fails. Also, all cannot be the name of a VLAN on the switch.

names—Name of one or more VLANs.

vlan-ids—Numeric identifier of one or more VLANs. For a series of tagged VLANs, specify a range; for example, **10-20** or **10-20 23 27-30**.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

mvrp

Syntax

```
mvrp {
  disable
  interface (all | interface-name) {
    disable;
    join-timer milliseconds;
    leave-timer milliseconds;
    leaveall-timer milliseconds;
    registration (forbidden | normal);
  }
  no-dynamic-vlan;
  traceoptions {
    file filename <files number > <size size> <no-stamp | world-readable |
      no-world-readable>;
    flag flag;
  }
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure Multiple VLAN Registration Protocol (MVRP) on a trunk interface to ensure that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs.

The remaining statements are explained separately.

Default MVRP is disabled by default.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 1115
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147

native-vlan-id

Syntax native-vlan-id *vlan-id*;

Hierarchy Level [edit **interfaces** *interface-name* unit 0 **family** ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the VLAN identifier to associate with untagged packets received on the interface.

Options ***vlan-id***—Numeric identifier of the VLAN.
Range: 0 through 4095

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

no-dynamic-vlan

Syntax no-dynamic-vlan;

Hierarchy Level [edit protocols mvrp]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable the dynamic creation of VLANs using Multiple VLAN Registration Protocol (MVRP) for interfaces participating in MVRP.

Dynamic VLAN configuration can be enabled on an interface independent of MVRP. The MVRP dynamic VLAN configuration setting does not override the interface configuration dynamic VLAN configuration setting. If dynamic VLAN creation is disabled on the interface in the interface configuration, no dynamic VLANs are created on the interface, including dynamic VLANs created using MVRP.

This option can only be applied globally; it cannot be applied per interface.

Default If MVRP is enabled, the dynamic creation of VLANs as a result of MVRP protocol exchange messages is enabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147

no-local-switching

Syntax no-local-switching

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify that access ports in this VLAN domain do not forward packets to each other. You use this statement with primary VLANs and isolated secondary VLANs.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Example: Configuring a Private VLAN on a J-EX Series Switch on page 1107
- Creating a Private VLAN (CLI Procedure) on page 1143

no-mac-learning

Syntax no-mac-learning;

Hierarchy Level [edit vlans *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disables MAC address learning for the specified VLAN.

Options There are no options to this statement.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Configuring Q-in-Q Tunneling (CLI Procedure) on page 1144
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 1051

no-mac-learning

Syntax no-mac-learning;

Hierarchy Level [edit ethernet-switching-options interfaces *interface-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Disable MAC address learning for the specified interface. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member.

Options There are no options to this statement.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation
- Understanding Q-in-Q Tunneling on J-EX Series Switches on page 1051

notification-interval

Syntax notification-interval *seconds*;

Hierarchy Level [edit **ethernet-switching-options mac-notification**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the MAC notification interval for a switch.

The MAC notification interval is the amount of time the switch waits before sending learned or unlearned MAC address SNMP notifications to the network management server. For instance, if the MAC notification interval is set to 10, all of the MAC address addition and removal SNMP notifications will be sent to the network management system every 10 seconds.

Options *seconds*—The MAC notification interval, in seconds.

Range: 1 through 60

Default: 30

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- Configuring MAC Notification (CLI Procedure) on page 1151

port-mode

Syntax port-mode *mode*;

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number* **family** ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure whether an interface on the switch operates in access or trunk mode.

Default All switch interfaces are in access mode.

Options

access—Have the interface operate in access mode. In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to network devices such as PCs, printers, IP telephones, and IP cameras.

trunk—Have the interface operate in trunk mode. In this mode, the interface can be in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

primary-vlan

Syntax primary-vlan *vlan-name*

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure the primary VLAN for this community VLAN. The primary VLAN must be tagged, and the community VLAN must be untagged.

TIP: To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

- Example: Configuring a Private VLAN on a J-EX Series Switch on page 1107
- Creating a Private VLAN (CLI Procedure) on page 1143

redundant-trunk-group

Syntax

```
redundant-trunk-group {
  group-name name {
    interface interface-name <primary>;
    interface interface-name;
  }
}
```

Hierarchy Level [edit **ethernet-switching-options**]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a primary link and secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over without waiting for normal STP convergence.

Options The statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

- Example: Configuring Redundant Trunk Links for Faster Recovery on page 1101
- Understanding Redundant Trunk Links on J-EX Series Switches on page 1049

registration

Syntax registration (forbidden | normal);

Hierarchy Level [edit protocols **mvrp interface** (all | *interface-name*)]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specifies the Multiple VLAN Registration Protocol (MVRP) registration mode for the interface if MVRP is enabled.

Default **normal**

Options **forbidden**—The interface or interfaces do not register and do not participate in MVRP.

normal—The interface or interfaces accept MVRP messages and participate in MVRP.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure) on page 1147

routing-instances

Syntax
```
routing-instances routing-instance-name {
    instance-type virtual-router;
    interface interface-name;
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure a virtual routing entity.

Options ***routing-instance-name***—Name for this routing instance.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation
- Example: Using Virtual Routing Instances to Route Among VLANs on J-EX Series Switches on page 1112
- Configuring Virtual Routing Instances (CLI Procedure) on page 1142

shutdown-threshold

Syntax shutdown-threshold *number*;

Hierarchy Level [edit **vlans** *vlan-name* dot1q-tunneling layer2-protocol-tunneling all | *protocol-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the interface is disabled. Once an interface is disabled, you must explicitly reenable it using the **clear ethernet-switching layer2-protocol-tunneling error** command. Otherwise, the interface remains disabled.

The shutdown threshold value must be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value, the drop threshold value has no effect.

You can specify a shutdown threshold value without specifying a drop threshold value.

Default No shutdown threshold is specified.

Options ***number***—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the interface is disabled.

Range: 1 through 1000

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- **drop-threshold on page 1187**
- Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches on page 1126
- Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure) on page 1150

vlan

Syntax

```
vlan {
  members [ (all | names | vlan-ids) ];
}
```

Hierarchy Level [edit **interfaces** *interface-name* **unit** *logical-unit-number* **family** ethernet-switching]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Bind an 802.1Q VLAN tag ID to a logical interface.

The remaining statement is explained separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- **show ethernet-switching interfaces on page 997**
- Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches on page 1070

- *Junos OS Network Interfaces Configuration Guide* at http://www.juniper.net/techpubs/software/junos/

vlan-id

Syntax vlan-id *number*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure an 802.1Q tag to apply to all traffic that originates on the VLAN.

Default If you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of **0**.

Options ***number*** —VLAN tag identifier.

Range: 0 through 4093.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Example: Setting Up Bridging with Multiple VLANs for J-EX Series Switches on page 1070
- Understanding Bridging and VLANs on J-EX Series Switches on page 1041

vlan-range

Syntax vlan-range *vlan-id-low-vlan-id-high*;

Hierarchy Level [edit **vlans** *vlan-name*]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure multiple VLANs. Each VLAN is assigned a VLAN ID number from the range.

Default None.

Options ***vlan-id-low-vlan-id-high*** —Specify the first and last VLAN ID number for the group of VLANs.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

Related Documentation

vlans

Syntax

```
vlans {
  vlan-name {
    description text-description;
    dot1q-tunneling {
      customer-vlans (id | range)
      layer2-protocol-tunneling all | protocol-name {
        drop-threshold number;
        shutdown-threshold number;
      }
    }
    filter input filter-name;
    filter output filter-name;
    interface interface-name {
      mapping (native (push | swap) | policy | tag (push | swap));
    }
    l3-interface vlan.logical-interface-number;
    mac-limit number;
    mac-table-aging-time seconds;
    no-local-switching;
    no-mac-learning;
    primary-vlan vlan-name;
    vlan-id number;
    vlan-range vlan-id-low-vlan-id-high;
  }
}
```

Hierarchy Level [edit]

Release Information Statement introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Configure VLAN properties on J-EX Series switches. The following configuration guidelines apply:

- Only private VLAN (PVLAN) firewall filters can be used when the VLAN is enabled for Q-in-Q tunneling.
- An S-VLAN tag is added to the packet if the VLAN is dot1q-tunneled and the packet is arriving from an access interface.
- You cannot use a firewall filter to assign a routed VLAN interface (RVI) to a VLAN.
- VLAN assignments performed using a firewall filter override all other VLAN assignments.

Default If you use the default factory configuration, all switch interfaces become part of the VLAN **default**.

Options ***vlan-name***—Name of the VLAN. The name can contain letters, numbers, hyphens (-), and periods (.) and can be up to 255 characters long.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

CHAPTER 63

Operational Mode Commands for Bridging and VLANs

clear ethernet-switching layer2-protocol-tunneling error

Syntax

clear ethernet-switching layer2-protocol-tunneling error
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Layer 2 protocol tunneling (L2PT) errors on one or more interfaces. If an interface has been disabled because the amount of Layer 2 protocol traffic exceeded the **shutdown-threshold** or because the switch has detected an error in the network topology or configuration, use this command to reenable the interface.

Options

none—Clears L2PT errors on all interfaces.

interface *interface-name*—(Optional) Clear L2PT errors on the specified interface.

Required Privilege Level

view

Related Documentation

- Example: Configuring Layer 2 Protocol Tunneling on J-EX Series Switches on page 1126
- Configuring Layer 2 Protocol Tunneling on J-EX Series Switches (CLI Procedure) on page 1150

List of Sample Output

clear ethernet-switching layer2-protocol-tunneling error

```
user@switch> clear ethernet-switching layer2-protocol-tunneling error
```

clear ethernet-switching layer2-protocol-tunneling error interface ge-0/1/1.0

```
user@switch> clear ethernet-switching layer2-protocol-tunneling error interface ge-0/1/1.0
```

clear ethernet-switching layer2-protocol-tunneling statistics

Syntax

clear ethernet-switching layer2-protocol-tunneling statistics
<interface *interface-name*>
<vlan *vlan-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear Layer 2 protocol tunneling (L2PT) statistics on one or more interfaces or VLANs.

Options

none—Clear L2PT statistics on all interfaces and VLANs.

interface *interface-name*—(Optional) Clear L2PT statistics on the specified interface.

vlan *vlan-name*—(Optional) Clear L2PT statistics on the specified VLAN.

Required Privilege Level

clear ethernet-switching layer2-protocol-tunneling statistics on page 1227
clear ethernet-switching layer2-protocol-tunneling error interface ge-0/1/1.0 on page 1227
clear ethernet-switching layer2-protocol-tunneling error vlan v2 on page 1227

clear ethernet-switching layer2-protocol-tunneling statistics

```
user@switch> clear ethernet-switching layer2-protocol-tunneling statistics
```

clear ethernet-switching layer2-protocol-tunneling error interface ge-0/1/1.0

```
user@switch> clear ethernet-switching layer2-protocol-tunneling statistics interface ge-0/1/1.0
```

clear ethernet-switching layer2-protocol-tunneling error vlan v2

```
user@switch> clear ethernet-switching layer2-protocol-tunneling statistics vlan v2
```

clear ethernet-switching table

Syntax

clear ethernet-switching table
<interface *interface-name*>
<mac *mac-address*>
<management-vlan>
<vlan *vlan-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description

Clear learned entries, which are media access control (MAC) addresses, in the Ethernet switching table (also called the forwarding database table).

Options

none—Clear learned entries in the Ethernet switching table.

interface *interface-name*—(Optional) Clear all learned MAC addresses for the specified interface from the Ethernet switching table.

mac *mac-address*—(Optional) Clear the specified learned MAC address from the Ethernet switching table.

management-vlan—(Optional) Clear all MAC addresses learned for the management VLAN from the Ethernet switching table. Note that you do not specify a VLAN name because only one management VLAN exists.

vlan *vlan-name*—(Optional) Clear all MAC addresses learned for the specified VLAN from the Ethernet switching table.

Required Privilege Level

clear ethernet-switching table on page 1228

Output Fields

This command produces no output.

clear ethernet-switching table

```
user@host> clear ethernet-switching table
```

clear gvrp statistics

Syntax clear gvrp statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear GARP VLAN Registration Protocol (GVRP) statistics.

Required Privilege Level clear

Related Documentation
- **show spanning-tree statistics on page 1416**
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

List of Sample Output **clear gvrp statistics on page 1229**

clear gvrp statistics

```
user@switch> clear gvrp statistics
```

clear mvrp statistics

Syntax clear mvrp statistics <interface *interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Clear Multiple VLAN Registration Protocol (MVRP) statistics.

Options none—Clear all MVRP statistics.

interface *interface-name*—Clear the MVRP statistics on the specified interface.

Required Privilege Level clear

Related Documentation

- **show mvrp statistics on page 1260**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 1115

List of Sample Output

clear mvrp statistics on page 1230
clear mvrp statistics interface ge-0/0/1.0 on page 1230

Output Fields When you enter this command, you are provided feedback on the status of your request.

clear mvrp statistics

```
user@switch> clear mvrp statistics
```

clear mvrp statistics interface ge-0/0/1.0

```
user@switch> clear mvrp statistics interface ge-0/0/1.0
```

show ethernet-switching interfaces

Syntax

show ethernet-switching interfaces
<brief | detail | summary>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 10.2 for J-EX Series switches.

- **Blocking** field output updated.
- The default view updated to include information about 802.1Q-tags.
- The **detail** view updated to include information VLAN mapping.

Description

Display information about switched Ethernet interfaces.

Options

none—(Optional) Display brief information for Ethernet switching interfaces.

brief | detail | summary—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display Ethernet switching information for a specific interface.

Required Privilege Level

view

Output Fields

Table 155 on page 1232 lists the output fields for the **show ethernet-switching interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 155: show ethernet-switching interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a switching interface.	All levels
State	Interface state. Values are **up** and **down**.	none, **brief**, **detail**, **summary**
VLAN members	Name of a VLAN.	none, **brief**, **detail**, **summary**
Tag	Number of the 802.1Q-tag.	All levels
Tagging	Specifies whether the interface forwards 802.1Q-tagged or untagged traffic.	All levels
Blocking	The forwarding state of the interface: • **unblocked**—Traffic is forwarded on the interface. • **blocked**—Traffic is not being forwarded on the interface. • **Disabled by bpdu control**—The interface is disabled due to receiving BPDUs on a protected interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. • **blocked by RTG**—The specified redundant trunk group is disabled. • **blocked by STP**—The interface is disabled due to a spanning tree protocol error. • **MAC limit exceeded**—The interface is temporarily disabled due to a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **MAC move limit exceeded**—The interface is temporarily disabled due to a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • **Storm control in effect**—The interface is temporarily disabled due to a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.	none, **brief**, **detail**, **summary**
Index	The VLAN index internal to Junos OS.	**detail**
mapping	The C-VLAN to S-VLAN mapping information: • **dot1q-tunneled**—The interface maps all traffic to the S-VLAN (all-in-one bundling). • **native**—The interface maps untagged and priority tagged packets to the S-VLAN. • **push**—The interface maps packets to a firewall filter to an S-VLAN. • **policy-mapped**—The interface maps packets to a specifically defined S-VLAN. • *integer*—The interface maps packets to the specified S-VLAN.	**detail**

    map, 802.1Q Tag: 134, Mapped Tag: native, push, dot1q-tunneled, unblocked
    map, 802.1Q Tag: 134, Mapped Tag: 20, push, dot1q-tunneled, unblocked
```

show ethernet-switching layer2-protocol-tunneling interface

Syntax show ethernet-switching-layer2-protocol-tunneling interface <*interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about Layer 2 protocol tunneling (L2PT) on interfaces that have been configured for L2PT.

Options none—Display L2PT information about all interfaces on which L2PT is enabled.

interface-name—(Optional) Display L2PT information for the specified interface.

Required Privilege Level view

Output Fields Table 156 on page 1234 lists the output fields for the **show ethernet-switching layer2-protocol-tunneling interface** command. Output fields are listed in the approximate order in which they appear.

Table 156: show ethernet-switching layer2-protocol-tunneling interface Output Fields

Field Name	Field Description
Interface	Name of an interface on the switch.
Operation	Type of operation being performed on the interface. Values are **Encapsulation** and **Decapsulation**.
State	State of the interface. Values are **active** and **shutdown**.
Description	If the interface state is **shutdown**, displays why the interface is shut down. If the description says **Loop detected**, it means that the interface is an access interface that has received L2PT-enabled PDUs. Access interfaces should not receive L2PT-enabled PDUs. This scenario might mean that there is a loop in the network.

show ethernet-switching layer2-protocol-tunneling interface

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface

Layer2 Protocol Tunneling information:
Interface     Operation       State      Description
ge-0/0/0.0    Encapsulation   Shutdown   Shutdown threshold exceeded
```

```
ge-0/0/1.0    Decapsulation   Shutdown   Loop detected
ge-0/0/2.0    Decapsulation   Active
```

show ethernet-switching layer2-protocol-tunneling interface ge-0/0/0.0

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface ge-0/0/0.0

Layer2 Protocol Tunneling information:
Interface     Operation       State      Description
ge-0/0/0.0    Encapsulation   Shutdown   Shutdown threshold exceeded
```

show ethernet-switching layer2-protocol-tunneling statistics

Syntax show ethernet-switching-layer2-protocol-tunneling statistics
<interface *interface-name*>
<vlan *vlan-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Layer 2 protocol tunneling (L2PT) statistics for Layer 2 PDU packets received by the switch.

NOTE: The show ethernet-switching-layer2-protocol-tunneling statistics command does not display L2PT statistics for Layer 2 PDU packets transmitted from the switch.

Options none—Display L2PT statistics for all interfaces on which you enabled L2PT.

<interface *interface-name*>—(Optional) Display L2PT statistics for the specified interface.

<vlan *vlan-name*>—(Optional) Display L2PT statistics for the specified VLAN.

Required Privilege Level view

Table 157: show ethernet-switching layer2-protocol-tunneling statistics Output Fields

VLAN	Field Description
VLAN	Name of a VLAN on which L2PT has been configured.

Table 157: show ethernet-switching layer2-protocol-tunneling statistics Output Fields *(continued)*

VLAN	Field Description
Interface	Name of an interface on which L2PT has been configured.
Protocol	Name of a protocol for which L2PT has been enabled. Values are **all**, **802.1x**, **802.3ah**, **cdp**, **e-lmi**, **gvrp**, **lacp**, **lldp**, **mmrp**, **mvrp**, **stp**, **vstp**, and **vtp**.
Operation	Type of operation being performed on the interface. Values are **Encapsulation** and **Decapsulation**.
Packets	Number of packets that have been encapsulated or decapsulated.
Drops	Number of packets that have exceeded the drop threshold and have been dropped.
Shutdowns	Number of times that packets have exceeded the shutdown threshold and the interface has been shut down.

show ethernet-switching layer2-protocol-tunneling statistics

show ethernet-switching layer2-protocol-tunneling vlan

Syntax show ethernet-switching-layer2-protocol-tunneling vlan <*vlan-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about Layer 2 protocol tunneling (L2PT) on VLANs that have been configured for L2PT.

Options none—Display information about L2PT for the VLANs on which you have configured L2PT.

vlan-name—(Optional) Display information about L2PT for the specified VLAN.

Required Privilege Level view

Output Fields Table 158 on page 1239 lists the output fields for the **show ethernet-switching layer2-protocol-tunneling vlan** command. Output fields are listed in the approximate order in which they appear.

Table 158: show ethernet-switching layer2-protocol-tunneling vlan Output Fields

Field Name	Field Description
VLAN	Name of the VLAN on which L2PT has been configured.
Protocol	Name of a protocol for which L2PT has been enabled. Values are **all**, **802.1x**, **802.3ah**, **cdp**, **e-lmi**, **gvrp**, **lacp**, **lldp**, **mmrp**, **mvrp**, **stp**, **vstp**, and **vtp**.
Drop Threshold	Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the switch begins dropping the Layer 2 PDUs.
Shutdown Threshold	Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the interface is disabled.

show ethernet-switching

```
user@switch> show ethernet-switching layer2-protocol-tunneling vlan

Layer2 Protocol Tunneling VLAN information:
```

layer2-protocol-tunneling vlan

```
VLAN            Protocol        Drop        Shutdown
                                Threshold   Threshold
v1              mvrp            100         200

List of Sample Output **show ethernet-switching mac-learning-log on page 1241**

Output Fields Table 159 on page 1241 lists the output fields for the **show ethernet-switching mac-learning-log** command. Output fields are listed in the approximate order in which they appear.

Table 159: show ethernet-switching mac-learning-log Output Fields

Field Name	Field Description
Date and Time	Timestamp when the MAC address was added or deleted from the log.
vlan_name	VLAN name. A value defined by the user for all user-configured VLANs.
MAC	Learned MAC address.
Deleted | Added	MAC address deleted or added to the MAC learning log.
Blocking	The forwarding state of the interface: • **blocked**—Traffic is not being forwarded on the interface. • **unblocked**—Traffic is forwarded on the interface.

```

show ethernet-switching mac-notification

Syntax show ethernet-switching mac-notification

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about MAC notification.

Required Privilege Level view

Related Documentation
- Verifying That MAC Notification Is Working Properly on page 1163

Output Fields Table 160 on page 1243 lists the output fields for the **show ethernet-switching mac-notification** command. Output fields are listed in the order in which they appear.

Table 160: show ethernet-switching mac-notification Output Fields

Field Name	Field Description
Notification Status	Displays the MAC notification status: • **Enabled**—MAC notification is enabled. • **Disabled**—MAC notification is disabled.
Notification Interval	Displays the MAC notification interval in seconds.

show ethernet-switching mac-notification (MAC Notification Enabled)

```
user@switch> show ethernet-switching mac-notification
Notification Status                : Enabled
Notification Interval              : 30
```

show ethernet-switching mac-notification (MAC Notification Disabled)

```
user@switch> show ethernet-switching mac-notification
Notification Status                : Disabled
Notification Interval              : 0
```

show ethernet-switching statistics aging

Syntax show ethernet-switching statistics aging

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display media access control (MAC) aging statistics.

Options none—(Optional) Display MAC aging statistics.

brief | detail—(Optional) Display the specified level of output.

Required Privilege Level view

Related Documentation

List of Sample Output **show ethernet-switching statistics aging on page 1244**

Output Fields Table 161 on page 1244 lists the output fields for the **show ethernet-switching statistics aging** command. Output fields are listed in the approximate order in which they appear.

Table 161: show ethernet-switching statistics aging Output Fields

Field Name	Field Description	Level of Output
Total age messages received	Total number of aging messages received from the hardware.	All levels
Immediate aging	Aging message indicating that the entry should be removed immediately.	All levels
MAC address seen	Aging message indicating that the MAC address has been detected by hardware and that the aging timer should be stopped.	All levels
MAC address not seen	Aging message indicating that the MAC address has not been detected by the hardware and that the aging timer should be started.	All levels
Error age messages	The received aging message contains the following errors: • **Invalid VLAN**—The VLAN of the packet does not exist. • **No such entry**—The MAC address and VLAN pair provided by the aging message does not exist. • **Static entry**—An unsuccessful attempt was made to age out a static MAC entry.	All levels

show ethernet-switching statistics aging

```
user@switch> show ethernet-switching statistics aging

Total age messages received: 0
  Immediate aging: 0, MAC address seen: 0, MAC address not seen: 0
```

```
Error age messages: 0
  Invalid VLAN: 0, No such entry: 0, Static entry: 0
```

show ethernet-switching statistics mac-learning

Syntax show ethernet-switching statistics mac-learning

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display media access control (MAC) learning statistics.

Options none—(Optional) Display MAC learning statistics for all interfaces.

brief | detail—(Optional) Display the specified level of output.

interface *interface-name* —(Optional) Display MAC learning statistics for the specified interface.

Required Privilege Level view

Output Fields Table 162 on page 1246 lists the output fields for the **show ethernet-switching statistics mac-learning** command. Output fields are listed in the approximate order in which they appear.

Table 162: show ethernet-switching statistics mac-learning Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface for which statistics are being reported.	All levels
Learning message from local packets	MAC learning message generated due to packets coming in on the management interface.	All levels
Learning message from transit packets	MAC learning message generated due to packets coming in on network interfaces.	All levels

Table 162: show ethernet-switching statistics mac-learning Output Fields *(continued)*

Field Name	Field Description	Level of Output
Learning message with error	MAC learning messages received with errors: • **Invalid VLAN**—The VLAN of the packet does not exist. • **Invalid MAC**—The MAC address is either NULL or a multicast MAC address. • **Security violation**—The MAC address is not an allowed MAC address. • **Interface down**—The MAC address is learned on an interface that is down. • **Incorrect membership**—The MAC address is learned on an interface that is not a member of the VLAN. • **Interface limit**—The number of MAC addresses learned on the interface has exceeded the limit. • **MAC move limit**—This MAC address has moved among multiple interfaces too many times in a given interval. • **VLAN limit**—The number of MAC addresses learned on the VLAN has exceeded the limit. • **Invalid VLAN index**—The VLAN of the packet, while configured, does not yet exist in the kernel. • **Interface not learning**—The MAC address is learned on an interface that does not yet allow learning—for example, the interface is blocked. • **No nexthop**—The MAC address is learned on an interface that does not have a unicast next hop. • **MAC learning disabled**—The MAC address is learned on an interface on which MAC learning has been disabled. • **Others**—The message contains some other error.	All levels

show ethernet-switching table

Syntax
show ethernet-switching table
<brief | detail | extensive | summary>
<interface *interface-name*>
<management-vlan>
<sort-by (*name* | *tag*)
<vlan (*vlan-name*)>

Release Information
Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description
Displays the Ethernet switching table.

Options
none—(Optional) Display brief information about the Ethernet switching table.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

management-vlan—(Optional) Display the Ethernet switching table for a management VLAN.

interface-name—(Optional) Display the Ethernet switching table for a specific interface.

sort-by (*name* | *tag*)—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

vlan *vlan-name*—(Optional) Display the Ethernet switching table for a specific VLAN.

Required Privilege Level

Output Fields
Table 163 on page 1249 lists the output fields for the **show ethernet-switching table** command. Output fields are listed in the approximate order in which they appear.

Table 163: show ethernet-switching table Output Fields

Field Name	Field Description	Level of Output
VLAN	The name of a VLAN.	All levels

Table 163: show ethernet-switching table Output Fields *(continued)*

Field Name	Field Description	Level of Output
Tag	The VLAN ID tag name or number.	**extensive**
MAC or **MAC address**	The MAC address associated with the VLAN.	All levels
Type	The type of MAC address. Values are: • **static**—The MAC address is manually created. • **learn**—The MAC address is learned dynamically from a packet's source MAC address. • **flood**—The MAC address is unknown and flooded to all members.	All levels
Age	The time remaining before the entry ages out and is removed from the Ethernet switching table.	All levels
Interfaces	Interface associated with learned MAC addresses or **All-members** (flood entry).	All levels
Learned	For learned entries, the time which the entry was added to the Ethernet-switching table.	**detail**, **extensive**
Nexthop index	The nexthop index number.	**detail**, **extensive**

show gvrp

Syntax show gvrp

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display GARP VLAN Registration Protocol (GVRP) information.

Options none—Displays all GVRP configuration attributes.

interface *interface-name* —(Optional) Displays GVRP statistics for a specific interface only.

Required Privilege Level view

Related Documentation

- **show gvrp statistics on page 1255**
- Example: Configure Automatic VLAN Administration Using GVRP on page 1087

List of Sample Output **show gvrp on page 1253**

Output Fields Table 164 on page 1253 lists the output fields for the **show gvrp** command. Output fields are listed in the approximate order in which they appear.

Table 164: show gvrp Output Fields

Field Name	Field Description
Global GVRP Configuration	Displays global GVRP information: • **GVRP status**—Displays whether GVRP is **enabled**or **disabled**. • **Join**—The maximum number of milliseconds the interfaces must wait before sending VLAN advertisements. • **Leave**— The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message. • **Leaveall**—The interval at which Leave All messages are sent on interfaces. Leave all messages maintain current GVRP VLAN membership information in the network.
Interface based configuration	Displays interface-specific GVRP information: • **Interface**—The interface on which GVRP is configured.. • **GVRP status**—Displays whether GVRP is **enabled** or **disabled**.

show gvrp

```
user@switch> show gvrp

Global GVRP configuration
  GVRP status   : Enabled
  GVRP timers (ms)
    Join        : 40
    Leave       : 120
    Leaveall    : 2000
```

```
Interface based configuration:
Interface  GVRP status
---------- -----------
ge-0/0/0.0 Enabled
```

show gvrp statistics

Syntax show gvrp statistics

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Generic VLAN Registration Protocol (GVRP) statistics in the form of GARP Information Propagation (GIP) messages.

Required Privilege Level clear

  Empty transmitted             : 4
  Leave In transmitted          : 0
  Leave Empty transmitted       : 0
  Leave All transmitted         : 4
```

show mvrp

Syntax show mvrp

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Multiple VLAN Registration Protocol (MVRP) configuration information.

Required Privilege Level view

Related Documentation

- **show mvrp statistics on page 1260**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 1115
- Verifying That MVRP Is Working Correctly on page 1162

List of Sample Output **show mvrp on page 1257**

Output Fields Table 166 on page 1257 lists the output fields for the **show mvrp** command. Output fields are listed in the approximate order in which they appear.

Table 166: show mvrp Output Fields

Field Name	Field Description
Global MVRP configuration	Displays global MVRP information: • **MVRP status**—Displays whether MVRP is **Enabled** or **Disabled**. • **MVRP dynamic vlan creation**—Displays whether global MVRP dynamic VLAN creation is **Dnabled** or **Disabled**.
MVRP Timers (ms)	Displays MVRP timer information: • **Interface**—The interface on which MVRP is configured. • **Join**—The maximum number of milliseconds the interfaces must wait before sending VLAN advertisements. • **Leave**—The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message. • **LeaveAll**—The interval at which LeaveAll messages are sent on interfaces. LeaveAll messages maintain current MVRP VLAN membership information in the network.
Interface based configuration	Displays interface-specific MVRP information: • **Interface**—The interface on which MVRP is configured. • **Status**—Displays whether MVRP is **Enabled** or **Disabled**. • **Registration**—Displays whether registration for the interface is **Forbidden** or **Normal**. • **Dynamic VLAN Creation**—Displays whether interface dynamic VLAN creation is **Enabled** or **Disabled**.

show mvrp

```
user@switch> show mvrp

Global MVRP configuration
```

```
MVRP status               : Enabled
MVRP dynamic vlan creation: Enabled
MVRP Timers (ms):
 Interface        Join   Leave   LeaveAll
 --------------   ----   -----   --------
 all              200    600     10000
 xe-0/1/1.0       200    600     10000

Interface based configuration:
 Interface        Status     Registration   Dynamic VLAN Creation
 --------------   --------   ------------   ---------------------
 all       Disabled   Normal    Enabled
 xe-0/1/1.0     Enabled    Normal         Enabled
```

show mvrp dynamic-vlan-memberships

Syntax show mvrp dynamic-vlan-memberships

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display all VLANs that have been created dynamically using Multiple VLAN Registration Protocol (MVRP) on the switch.

Required Privilege Level clear

Related Documentation

- **show mvrp on page 1257**
- **show mvrp statistics on page 1260**
- Example: Configuring Automatic VLAN Administration Using MVRP on J-EX Series Switches on page 1115

List of Sample Output **show mvrp dynamic-vlan-memberships on page 1259**

Output Fields Table 167 on page 1259 lists the output fields for the **show mvrp dynamic-vlan-memberships** command. Output fields are listed in the approximate order in which they appear.

Table 167: show mvrp dynamic-vlan-memberships Output Fields

Field Name	Field Description
VLAN Name	The name of the dynamically created VLAN.
Interfaces	The interface or interfaces that are bound to the dynamically created VLAN.

show mvrp dynamic-vlan-memberships

```
user@switch> show mvrp dynamic-vlan-memberships
VLAN Name              Interfaces
-------------------        ----------------
__mvrp_100__               xe-0/1/1.0
                           xe-0/1/0.0
__mvrp_200__               xe-0/1/1.0
                           xe-0/1/0.0
__mvrp_300__               xe-0/1/1.0
```

show mvrp statistics

Syntax show mvrp statistics <interface *interface-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display Multiple VLAN Registration Protocol (MVRP) statistics in the form of Multiple Registration Protocol data unit (MRPDU) messages.

Options none—Show MVRP statistics for all interfaces on the switch.

interface *interface-name*—Show MVRP statistics for the specified interface.

Required Privilege Level clear

Related Documentation

```

show redundant-trunk-group

Syntax **show redundant-trunk-group <group-name *group-name*>**

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about redundant trunk groups.

Options group-name *group-name*—Display information about the specified redundant trunk group.

Required Privilege Level view

Related Documentation
- Example: Configuring Redundant Trunk Links for Faster Recovery on page 1101
- Understanding Redundant Trunk Links on J-EX Series Switches on page 1049

List of Sample Output **show redundant-trunk-group group-name Group1 on page 1262**

Output Fields Table 169 on page 1262 lists the output fields for the **show redundant-trunk-group** command. Output fields are listed in the approximate order in which they appear.

Table 169: show redundant-trunk-group Output Fields

Field Name	Field Description
Group Name	Name of the redundant trunk port group.
Interface	Name of an interface belonging to the trunk port group. • **(P)** denotes a primary interface. • **(A)** denotes an active interface. • Lack of **(A)** denotes a blocking interface.
State	Operating state of the interface: **UP** or **DOWN**.
Last Time of Flap	Date and time at which the advertised link became unavailable, and then, available again.
# Flaps	Total number of flaps since the last switch reboot.

show redundant-trunk-group group-name Group1

```
user@switch> show redundant—trunk-group group-name Group1
show redundant-trunk-group group-name Group1

Group Name Interface         State     Last Time of Flap       # Flaps
  Group1   ge-0/0/45.0 (P)     UP      Fri Jan  2 04:10:58      0
           ge-0/0/47.0         UP      Fri Jan  2 04:10:58      0
```

show vlans

Syntax

show vlans
<brief | detail | extensive>
<dot1q-tunneling>
<management-vlan>
<sort-by (name | tag)>
<summary>
<*vlan-name*>
<*vlan-range-name*>

Release Information Command introduced before Junos OS Release 10.2 for J-EX Series switches.

Description Display information about VLANs configured on bridged Ethernet interfaces. For interfaces configured to support a VoIP VLAN and a data VLAN, the **show vlans** command displays both tagged and untagged membership for those VLANs.

NOTE: When a series of VLANs is created with the vlan-range statement, such VLAN names are prefixed and suffixed with a double underscore. For example, a series of VLANs using the VLAN range 1–3 and the base VLAN name marketing are displayed as __marketing_1__, __marketing_2__, and __marketing_3__.

NOTE: To display an 802.1X supplicant successfully authenticated in multiple-supplicant mode with dynamic VLAN movement, use the show vlans *vlan-name* extensive operational mode command, where *vlan-name* is the dynamic VLAN.

Options none—Display information for all VLANs. VLAN information is displayed by VLAN name in ascending order.

brief | detail | extensive—(Optional) Display the specified level of output.

dot1q-tunneling—(Optional) Display VLANs with the Q-in-Q tunneling feature enabled.

management-vlan—(Optional) Display management VLANs.

sort-by (name | tag)—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

summary—(Optional) Display the total number of VLANs and counts of VLANs by type—for example, the number of dynamic, 802.1Q, and Q-in-Q tunneled VLANs.

vlan-name—(Optional) Display information for the specified VLAN.

vlan-range-name—(Optional) Display information for the specified VLAN range. To see information for all members of the VLAN range, specify the base VLAN name—for

example, **employee** for a VLAN range that includes **__employee_1__** through **__employee_10__**.

Output Fields Table 170 on page 1264 lists the output fields for the **show vlans** command. Output fields are listed in the approximate order in which they appear.

Table 170: show vlans Output Fields

Field Name	Field Description	Level of Output
Name	Name of a VLAN.	none, **brief**
Tag	The 802.1Q tag applied to this VLAN. If **none** is displayed, no tag is applied.	All levels
Interfaces	Interface associated with learned MAC addresses or all-members (flood entry). An asterisk (*) beside the interface indicates that the interface is **UP**.	All levels
Address	The IP address.	none, **brief**
Ports Active / Total	The number of interfaces associated with a VLAN. The **Active** column indicates interfaces that are **UP**, and the **Total** column indicates interfaces that are active and inactive.	**brief**
VLAN	Name of a VLAN.	**detail**, **extensive**
Admin state	Indicates whether the physical link is operational and can pass packets.	**detail**, **extensive**

Table 170: show vlans Output Fields *(continued)*

Field Name	Field Description	Level of Output
Dot1q Tunneling Status	Indicates whether Q-in-Q tunneling is enabled.	**detail**, **extensive**
MAC learning Status	Indicates whether MAC learning is disabled.	**detail**, **extensive**
Description	A description for the VLAN.	**detail**,**extensive**
Primary IP	Primary IP address associated with a VLAN.	**detail**
Number of interfaces	The number of interfaces associated with a VLAN. Both the total number of interfaces and the number of active interfaces associated with a VLAN are displayed.	**detail**, **extensive**
STP	The spanning tree associated with a VLAN.	**detail**, **extensive**
RTG	The redundant trunk group associated with a VLAN.	**detail**, **extensive**
Tagged interfaces	The tagged interfaces to which a VLAN is associated.	**detail**, **extensive**
Untagged interfaces	The untagged interfaces to which a VLAN is associated.	**detail**. **extensive**
Customer VLAN Ranges	Lists the customer VLAN (C-VLAN) ranges associated with this service VLAN (S-VLAN).	**extensive**
Private VLAN Mode	The private VLAN mode for this VLAN. Values are **Primary**, **Isolated**, and **Community**.	**extensive**
Primary VLAN	The primary VLAN tag for this secondary VLAN.	**extensive**
Interrnal Index	VLAN index internal to the Junos OS.	**extensive**
Origin	The manner in which the VLAN was created. Values are **static** and **learn**.	**extensive**
Protocol	Port-based VLAN or MAC-based VLAN. MAC-based protocol is displayed when VLAN assignment is done either statically or dynamically through 802.1X.	**extensive**
Mac aging time	The MAC aging timer.	**extensive**
IP addresses	IP address associated with a VLAN.	**extensive**
Number of MAC entries	For MAC-based VLANs created either statically or dynamically, the MAC addresses associated with an interface.	**extensive**
Secondary VLANs	The secondary VLANs associated with a primary VLAN.	**extensive**
Isolated VLANs	The isolated VLANs associated with a primary VLAN.	**extensive**
Community VLANs	The community VLANs associated with a primary VLAN.	**extensive**

Table 170: show vlans Output Fields *(continued)*

Field Name	Field Description	Level of Output
VLANs summary	VLAN counts: • **Total**—Total number of VLANs on the switch. • **Configured VLANs**—Number of VLANs that are based on user-configured settings. • **Internal VLANs**—Number of VLANs created by the system with no explicit configuration or protocol—for example, the **default** VLAN and the VLAN created when a trunk interface is not configured with native VLAN membership. • **Temporary VLANs**—Number of VLANs from the previous configuration that the system retains for a limited time after restart. Temporary VLANs are converted into one of the other types of VLAN, or are removed from the system if the current configuration does not require them.	All levels

Dot1q VLANs summary	802.1Q VLAN counts:
	• **Total**—Total number of 802.1Q VLANs on the switch.
	• **Tagged VLANs**—Number of tagged 802.1Q VLANs.
	• **Untagged VLANs**—Number of untagged 802.1Q VLANs.
	• **Private VLAN**—Counts of the following kinds of 802.1Q private VLANs (PVLANs):
	  ◦ **Primary VLANs**—Number of primary forwarding private VLANs.
	  ◦ **Community VLANs**—Number of secondary transporting and forwarding private VLANs.
	  ◦ **Isolated VLANs**—Number of secondary receiving and forwarding private VLANs.
		All levels

Dot1q Tunneled VLANs summary	Q-in-Q VLAN counts: • **Total**—Total number of Q-in-Q VLANs on the switch. • **Private VLAN**—Counts of primary, community, and isolated Q-in-Q private VLANs (PVLANs).	All levels
Dynamic VLANs	Counts of VLANs assigned or created dynamically by a protocol: • **Total**—Total number of dynamic VLANs on the switch. • **Dot1x**—Number of 802.1X VLANs authenticated and assigned when the switch learns the MAC address of a supplicant host from a packet's source MAC address. • **MVRP**—Number of VLANs created by the Multiple VLAN Registration Protocol (MVRP).	All levels

PART 14

Spanning-Tree Protocols

CHAPTER 64

Spanning-Tree Protocols—Overview

Understanding STP for J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default spanning-tree protocol for J-EX Series switches is RSTP. RSTP provides faster convergence times than STP. However, some legacy networks require the slower convergence times of basic STP.

If your network includes 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. See “Configuring STP (CLI Procedure)” on page 1336. When you explicitly configure STP, the J-EX Series switches use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP. If you use VLANs, you should enable VSTP and use it on your network. See “Understanding VSTP for J-EX Series Switches” on page 1281.

You can use the same operational commands (**show spanning-tree bridge** and **show spanning-tree interface**) to check the status of your spanning-tree configuration, regardless of which spanning-tree protocol has been configured.

STP uses bridge protocol data unit (BPDU) packets to exchange information with other switches. BPDUs send hello packets out at regular intervals to exchange information across bridges and detect loops in a network topology. There are two types of BPDUs:

- Configuration BPDUs: Contain configuration information about the transmitting switch and its ports, including switch and port MAC addresses, switch priority, port priority, and port cost.
- Topology Change Notification (TCN) BPDUs: When a bridge needs to signal a topology change, it starts to send TCNs on its root port. The designated bridge receives the TCN, acknowledges it, and generates another one for its own root port. The process continues until the TCN reaches the root bridge.

STP uses the information provided by the BPDUs to elect a root bridge, identify root ports for each switch, identify designated ports for each physical LAN segment, and prune specific redundant links to create a loop-free tree topology. All leaf devices calculate the best path to the root device and place their ports in blocking or forwarding states based on the best path to the root. The resulting tree topology provides a single active Layer 2 data path between any two end stations.

Understanding RSTP for J-EX Series Switches

J-EX Series Switches use Rapid Spanning Tree Protocol (RSTP) to provide better reconvergence time than that provided by the base Spanning Tree Protocol (STP). RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state.

Although STP provides basic loop prevention functionality, it does not provide fast network convergence when there are topology changes. STP's process to determine network state transitions is slower than RSTP's because it is timer-based. A device must reinitialize every time a topology change occurs. The device must start in the listening state and transition to the learning state and eventually to a forwarding or blocking state. When default values are used for the maximum age (20 seconds) and forward delay (15 seconds), it takes 50 seconds for the device to converge. RSTP converges faster because it uses a handshake mechanism based on point-to-point links instead of the timer-based process used by STP.

For networks with VLANs, you can use VLAN Spanning Tree Protocol (VSTP) to run one or more STP or RSTP instances for each VLAN on which VSTP is enabled. VSTP takes the paths of each VLAN into account when calculating routes.. VSTP uses RSTP instances by default.

An RSTP domain running on a switch has the following components:

- A *root port*, which is the “best path” to the root device.
- A *designated port*, which indicates that the switch is the designated bridge for the other switch connecting to this port.

- An *alternate port*, which provides an alternate root port.
- A *backup port*, which provides an alternate designated port.

Port assignments change through messages exchanged throughout the domain. An RSTP device generates configuration messages once per every hello time interval. If an RSTP device does not receive a configuration message from its neighbor after an interval of three hello times, it determines that the connection with the neighbor is lost. When a *root port* or a *designated port* fails on a device, the device generates a configuration message with the proposal bit set. Once its neighbor device receives this message, it verifies that this configuration message is better than the one saved for that port and then it starts a *synchronizing* operation to ensure that all of its ports are in sync with the new information.

Similar waves of proposal agreement handshake messages propagate toward the leaves of the network, quickly restoring the connectivity after a topology change (in a well-designed network that uses RSTP, network convergence can take as little as 0.5 seconds). If a device does not receive an agreement to a proposal message it has sent, it returns to the original IEEE 802.D convention.

RSTP was originally defined in the IEEE 802.1w draft specification and later incorporated into the IEEE 802.1D-2004 specification.

VSTP and RSTP can be configured concurrently. You can selectively configure up to 253 VLANs using VSTP; the remaining VLANs will be configured using RSTP. VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on the switch.

Understanding MSTP for J-EX Series Switches

Although RSTP provides faster convergence time than STP, it still does not solve a problem inherent in STP: All VLANs within a LAN must share the same spanning tree. To solve this problem, J-EX Series Switches use Multiple Spanning Tree Protocol (MSTP) to create a loop-free topology in networks with multiple spanning-tree regions.

An MSTP region allows a group of bridges to be modeled as a single bridge. An MSTP region contains multiple spanning tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates better load sharing across redundant links.

MSTP region can support up to 64 MSTIs and each instance can support anywhere from 1 through 4094 vlans.

MSTP was originally defined in the IEEE 802.1s draft specification and later incorporated into the IEEE 802.1Q-2003 specification.

Understanding BPDU Protection for STP, RSTP, and MSTP on J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). BPDU protection can help prevent STP misconfigurations that can lead to network outages.

A loop-free network is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Receipt of BPDUs on certain interfaces in an STP, RSTP, VSTP, or MSTP topology, however, can lead to network outages. Enable BPDU protection on those interfaces to prevent these outages.

Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a user bridge application running on a PC can also generate BPDUs. If these BPDUs are picked up by STP applications running on the switch, they can trigger STP miscalculations, and those miscalculations can lead to network outages.

Enable BPDU protection on switch interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If BPDUs are received on a protected interface, the interface is disabled and stops forwarding frames.

Not only can you configure BPDU protection on a switch with a spanning tree, but also on a switch without a spanning tree. This type of topology typically consists of a non-STP switch connected to an STP switch through a trunk interface.

To configure BPDU protection on a switch with a spanning tree, include the **bpdu-block-on-edge** statement at the [**edit protocols** (**stp** | **mstp** | **rstp**)] hierarchy level. To configure BPDU protection on a switch without a spanning tree, include the **bpdu-block** statement at the [**edit ethernet-switching-options interface** *interface-name*] hierarchy level.

After the misconfiguration that triggered the BPDUs being sent to an interface is fixed in the topology, the interface can be unblocked in one of two ways:

- If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires.
- Use the operational mode command **clear ethernet-switching bpdu-error**.

Disabling the BPDU protection configuration does not unblock the interface.

Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from moving into a forwarding state that would result in a loop opening up in the network.

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

However, a blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor.

When loop protection is enabled, the spanning-tree topology detects root ports and blocked ports and makes sure both keep receiving BPDUs. If a loop-protection-enabled interface stops receiving BPDUs from its designated port, it reacts as it would react to a problem with the physical connection on this interface. It doesn't transition the interface to a forwarding state, but instead transitions it to a loop-inconsistent state. The interface recovers and then it transitions back to the spanning-tree blocking state as soon as it receives a BPDU.

We recommend that you enable loop protection on all switch interfaces that have a chance of becoming root or designated ports. Loop protection is most effective when

enabled in the entire switched network. When you enable loop protection, you must configure at least one action (**alarm**, **block**, or both).

An interface can be configured for either loop protection or root protection, but not for both.

Understanding Root Protection for STP, RSTP, VSTP, and MSTP on J-EX Series Switches

J-EX Series Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). A loop-free network is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a root port elected through this process has the possibility of being wrongly elected. A user bridge application running on a PC can generate BPDUs, too, and interfere with root port election. Root protection allows network administrators to manually enforce the root bridge placement in the network.

Enable root protection on interfaces that should not receive superior BPDUs from the root bridge and should not be elected as the root port. These interfaces become designated ports and are typically located on an administrative boundary. If the bridge receives superior STP BPDUs on a port that has root protection enabled, that port transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. After the bridge stops receiving superior STP BPDUs on the interface with root protection, the interface returns to a listening state, followed by a learning state, and ultimately back to a forwarding state. Recovery back to the forwarding state is automatic.

When root protection is enabled on an interface, it is enabled for all the STP instances on that interface. The interface is blocked only for instances for which it receives superior BPDUs. Otherwise, it participates in the spanning-tree topology.

An interface can be configured for either root protection or loop protection, but not for both.

Understanding VSTP for J-EX Series Switches

VLAN Spanning Tree Protocol (VSTP) allows J-EX Series Switches to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining best paths within the VLANs instead of within the entire network.

You can configure VSTP for a maximum of 253 VLANs. If you need to run a spanning-tree protocol on more than 253 VLANs, you must configure VSTP and RSTP concurrently. When VSTP and RSTP are configured, up to 253 VLANs can use VSTP and the remaining VLANs use RSTP. You can selectively configure which VLANs use VSTP when VSTP and RSTP are configured.

VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on the switch.

NOTE: We recommend that you enable VSTP on all VLANs that could receive VSTP bridge protocol data units (BPDUs).

CHAPTER 65

Examples of Spanning-Tree Protocols Configuration

Example: Configuring Faster Convergence and Improving Network Stability with RSTP on J-EX Series Switches

J-EX Series switches use Rapid Spanning Tree Protocol (RSTP) to provide a loop-free topology. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state. RSTP provides better reconvergence time than original STP because it uses protocol handshake messages rather than fixed timeouts. Eliminating the need to wait for timers to expire makes RSTP more efficient than STP.

This example describes how to configure RSTP on four J-EX Series switches:

Requirements

This example uses the following hardware and software components:

- Four J-EX Series switches

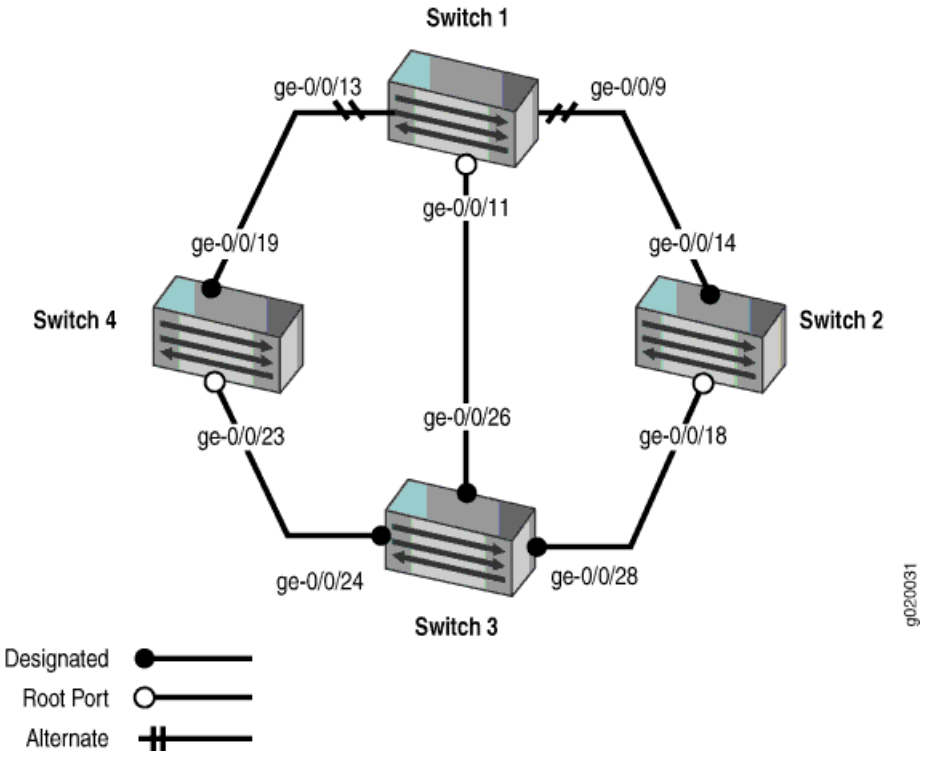
Before you configure the switches for RSTP, be sure you have:

- Installed the four switches. See “Connecting and Configuring a J-EX Series Switch (J-Web Procedure)” on page 163.
- Performed the initial software configuration on all switches. See Installing and Connecting a J-EX4200 Switch.

Overview and Topology

In this example, four J-EX Series switches are connected in the topology displayed in Figure 33 on page 1284 to create a loop-free topology.

Figure 33: Network Topology for RSTP



The interfaces shown in Table 171 on page 1285 will be configured for RSTP.

NOTE: You can configure RSTP on logical or physical interfaces. This example shows RSTP configured on logical interfaces.

Table 171: Components of the Topology for Configuring RSTP on J-EX Series Switches

Property	Settings
Switch 1	The following ports on Switch 1 are connected in this way: • **ge-0/0/9** is connected to Switch 2 • **ge-0/0/13** is connected to Switch 4 • **ge-0/0/11** is connected to Switch 3
Switch 2	The following ports on Switch 2 are connected in this way: • **ge-0/0/14** is connected to Switch 1 • **ge-0/0/18** is connected to Switch 3
Switch 3	The following ports on Switch 3 are connected in this way: • **ge-0/0/26** is connected to Switch 1 • **ge-0/0/28** is connected to Switch 2 • **ge-0/0/24** is connected to Switch 4
Switch 4	The following ports on Switch 4 are connected in this way: • **ge-0/0/19** is connected to Switch 1 • **ge-0/0/23** is connected to Switch 3
VLAN names and tag IDs	**voice-vlan**, tag **10** **employee-vlan**, tag **20** **guest-vlan**, tag **30** **camera-vlan**, tag **40**

This configuration example creates a loop-free topology between four J-EX Series switches using RSTP.

An RSTP topology contains ports that have specific roles:

- The root port is responsible for forwarding data to the root bridge.
- The alternate port is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The designated port forwards data to the downstream network segment or device.
- The backup port is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

NOTE: You also can create a loop-free topology between the aggregation layer and the distribution layer using redundant trunk links. For more information about configuring redundant trunk links, see “Example: Configuring Redundant Trunk Links for Faster Recovery” on page 1101.

Configuring RSTP on Switch 1

To configure RSTP on Switch 1, perform these tasks:

CLI Quick Configuration
