Introduction

The information in this specification and referenced specifications should be sufficient for a provider or consumer of this data to identify unambiguously the classes, properties, methods, and values that shall be instantiated and manipulated to represent and manage the OS deployment feature of managed systems and subsystems that are modeled using the DMTF CIM core and extended model definitions.

The target audience for this specification is implementers who are writing CIM-based providers, or consumers of management interfaces that represent the component described in this document.
OS Deployment Profile

1 Scope
The Operating System (OS) Deployment Profile extends the management capabilities of referencing profiles by adding the capability to represent OS deployment configuration features. The OS deployment feature consists of:

- Provide the supported OS and version information from the embedded OS driver pack.
- Unpack the OS Driver Update Package (DUP) and extract drivers for a specified OS; the drivers are placed on a local flash drive (NVRAM) or on a network share.
- Expose the unpacked drivers to the host as a USB device.
- Ability to boot to PXE images.
- Ability to boot to the ISO image present on a network share.
- Ability to download ISO Image and save it in vFlash.
- Ability to boot to the ISO present in vFlash.

2 Normative References
The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and Definitions
For the purposes of this document, the following terms and definitions apply.
3.1
can
used for statements of possibility and capability, whether material, physical, or causal

3.2
cannot
used for statements of possibility and capability, whether material, physical, or causal

3.3
conditional
indicates requirements to be followed strictly in order to conform to the document when the specified conditions are met

3.4
mandatory
indicates requirements to be followed strictly in order to conform to the document and from which no deviation is permitted

3.5
may
indicates a course of action permissible within the limits of the document

3.6
need not
indicates a course of action permissible within the limits of the document

3.7
optional
indicates a course of action permissible within the limits of the document

3.8
referencing profile
indicates a profile that owns the definition of this class and can include a reference to this profile in its “Related Profiles” table

3.9
shall
indicates requirements to be followed strictly in order to conform to the document and from which no deviation is permitted

3.10
shall not
indicates requirements to be followed strictly in order to conform to the document and from which no deviation is permitted

3.11
should
indicates that among several possibilities, one is recommended as particularly suitable, without mentioning or excluding others, or that a certain course of action is preferred but not necessarily required
3.12
should not
indicates that a certain possibility or course of action is deprecated but not prohibited

5 Synopsis

Profile Name: Operating System (OS) Deployment
Version: 1.1.0
Organization: DCIM
CIM Schema Version: 2.19.1
Central Class: DCIM_OSDeploymentService
Scoping Class: CIM_ComputerSystem

The OS Deployment Profile extends the management capability of the referencing profiles by adding the capability to support OS deployment activities by manipulating the OS deployment features provided by the service processor. These features include:

• Identify the list of OS drivers.
• Unpack the OS DUP and extract drivers for a specified OS; the drivers are placed on a local flash drive (nvram).
• Expose the unpacked drivers to the host as a USB device.
• Expose the drivers to the network in a secure manner for access by a management application.
• Support booting to an OS provisioning image from a network share.
• Download a pre-boot OS provisioning image from a network share to vFlash.
• Support booting to an OS provisioning image from vFlash.

DCIM_OSDeploymentService shall be the Central Class.

Table 1 identifies related profiles.

6 Description

The Operating System (OS) Deployment Profile describes the OS deployment configuration service, and the methods exposed to manage the service processor OS deployment features. The profile also describes the relationship of the OS Deployment Profile classes to DMTF and Dell profile version information.

The interface for the OS deployment feature consists of the following functionality:

- Identify the list of OS drivers.
- Unpack the OS DUP and extract drivers for a specified OS; the drivers are placed on a local flash drive (nvram).
- Expose the unpacked drivers to the host as a USB device.
- Expose the drivers to the network in a secure manner for access by a management application.
- Support booting to an OS provisioning image from a network share.
- Download a pre-boot OS provisioning image from a network share to vFlash.
- Support booting to an OS provisioning image from vFlash.

Figure 1 represents the class schema for the OS Deployment Profile. For simplicity, the prefix CIM_ has been removed from the names of the classes that are standard DMTF classes.

The OS Deployment feature in a service processor is represented by the instance of the DCIM_OSDeploymentService class. The DCIM_OSDeploymentService has extrinsic methods for accomplishing the various OS deployment features described above. The OS Deployment profile information is represented with the instance of CIM_RegisteredProfile.

---

**Figure 1 – OS Deployment Profile: Class Diagram**
7 Implementation Requirements

Requirements and guidelines for propagating and formulating certain properties of the classes are discussed in this section.

7.1 DCIM_OSDeploymentService

One instance of DCIM_OSDeploymentService shall be instantiated.

7.1.1 ElementName

The value of ElementName shall be formulated using the following pattern:

ElementName = “OSD”

7.2 CIM_ConcreteJob

At most one instance of CIM_ConcreteJob shall be instantiated. An instance of CIM_ConcreteJob may be returned as an output parameter for all the extrinsic methods supported by DCIM_OSDeploymentService.

7.2.1 Name

The value of Name shall be formulated using the following pattern:

Name = “DCIM_OSDeploymentService.ExtrinsicMethodName”, ex: Name=“UnpackAndAttach”

CIM_ConcreteJob reference returned as an output of DCIM_OSDeploymentService.UnpackAndAttach, shall have the following Name:

- CIM_ConcreteJob.Name = “UnpackAndAttach”

CIM_ConcreteJob reference returned as an output of DCIM_OSDeploymentService.UnpackAndShare, shall have the following Name:

- CIM_ConcreteJob.Name = “UnpackAndShare”.

CIM_ConcreteJob reference returned as an output of DCIM_OSDeploymentService.BootToNetworkISO, shall have the following Name:

- CIM_ConcreteJob.Name = “BootToNetworkISO”.

7.2.2 JobStatus

The value of the JobStatus, a free form string, property shall be one of the entries in Table 2

<table>
<thead>
<tr>
<th>Job Name</th>
<th>JobStatus</th>
<th>JobStatus Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“UnpackAndAttach”</td>
<td>Processing Driver Pack</td>
<td>Extracting drivers, creating dynamic partition, copying drivers, and attaching the partition as a USB device to the host.</td>
</tr>
<tr>
<td>“UnpackAndAttach”</td>
<td>Success</td>
<td>Successfully executed the method.</td>
</tr>
<tr>
<td>“UnpackAndAttach”</td>
<td>Failed</td>
<td>Failed to execute the method, refer to MessageID and Message properties of the DCIM_OSDConcreteJob instance for detailed information.</td>
</tr>
<tr>
<td>“UnpackAndShare”</td>
<td>Processing Driver Pack</td>
<td>Extracting drivers and copying drivers to the host.</td>
</tr>
</tbody>
</table>
“UnpackAndShare” | Success | Successfully executed the method.
“UnpackAndShare” | Failed | Failed to execute the method, refer to MessageID and Message properties of the DCIM_OSDConcreteJob instance for detailed information.
BootToNetworkISO | Rebooting to ISO | Attaching the network ISO image as a local CDROM to the host and booting to it.
BootToNetworkISO | Success | Successfully executed the method.
BootToNetworkISO | Failed | Failed to execute the method, refer to MessageID and Message properties of the DCIM_OSDConcreteJob instance for detailed information.
BootToISOFromVFlash | Rebooting to ISO | Attaching the ISO image on vFlash as a local CDROM to the host and booting to it.
BootToISOFromVFlash | Success | Successfully executed the method.
BootToISOFromVFlash | Failed | Failed to execute the method, refer to MessageID and Message properties of the DCIM_OSDConcreteJob instance for detailed information.
DownloadISOToVFlash | Downloading | Copying the ISO image from network share to vFlash.
DownloadISOToVFlash | Success | Successfully executed the method.
DownloadISOToVFlash | Failed | Failed to execute the method, refer to MessageID and Message properties of the DCIM_OSDConcreteJob instance for detailed information.

### 8 Methods

This section details the requirements for supporting extrinsic methods for the CIM elements defined by this profile.

#### 8.1 Method: DCIM_OSDeploymentService.GetDriverPackInfo()

The GetDriverPackInfo method returns the list of OSs that can be installed on the server using the embedded device drivers present in the Lifecycle Controller.

Return values for GetDriverPackInfo() shall be as specified in Table 3 where the method-execution behavior matches the return-code description. GetDriverPackInfo() method’s parameters are specified in Table 4 – DCIM_OSDeploymentService.GetDriverPackInfo() Method: Parameters.

Output parameters are Version and OSList.

#### Table 3 – DCIM_OSDeploymentService.GetDriverPackInfo() Method: Return Code Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request was successfully executed.</td>
</tr>
<tr>
<td>1</td>
<td>Method is not supported in the implementation.</td>
</tr>
<tr>
<td>2</td>
<td>Error occurred.</td>
</tr>
<tr>
<td>4096</td>
<td>Job started: REF returned to started CIM_ConcreteJob</td>
</tr>
</tbody>
</table>
### Table 4 – DCIM_OSDeploymentService.GetDriverPackInfo() Method: Parameters

<table>
<thead>
<tr>
<th>Qualifiers</th>
<th>Name</th>
<th>Type</th>
<th>Description/Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUT (required)</td>
<td>Version</td>
<td>String</td>
<td>NULL or version of the driver pack.</td>
</tr>
<tr>
<td>OUT (required)</td>
<td>OSList</td>
<td>String[]</td>
<td>NULL or contains the list of operating systems supported for this server.</td>
</tr>
<tr>
<td>OUT (optional)</td>
<td>Job</td>
<td>CIM_ConcreteJob</td>
<td>NULL or reference to a CIM_ConcreteJob</td>
</tr>
<tr>
<td>OUT (optional)</td>
<td>MessageID</td>
<td>String</td>
<td>If the method fails to execute, the error message ID is returned.</td>
</tr>
<tr>
<td>OUT (optional)</td>
<td>Message</td>
<td>String</td>
<td>If the method fails to execute, the error message in English is returned.</td>
</tr>
</tbody>
</table>

#### 8.2 Method: DCIM_OSDeploymentService.UnpackAndAttach()

The UnpackAndAttach() method will extract the drivers for the selected OS to a USB device that will be attached locally to the server for the specified time interval. Return values for UnpackAndAttach() shall be as specified in Table 5, where the method-execution behavior matches the return-code description.

UnpackAndAttach() method’s parameters are specified in Table 6 – DCIM_OSDeploymentService.UnpackAndAttach() Method: Parameters.

No standard messages are defined for this method.

### Table 5 – DCIM_OSDeploymentService.UnpackAndAttach() Method: Return Code Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

</tr>
<tr>
<td>OUT (optional)</td>
<td>Message</td>
<td>String</td>
<td>If the method fails to execute, the error message in English is returned.</td>
</tr>
</tbody>
</table>
8.3 Method: DCIM_OSDeploymentService.DetachDrivers()

This method will detach the USB device containing the drivers from the host server. Return values for DetachDrivers() shall be as specified in Table 7, where the method-execution behavior matches the return-code description. DetachDrivers() method’s parameters are specified in Table 8 – DCIM_OSDeploymentService.DetachDrivers() Method: Parameters.

Table 7 – DCIM_OSDeploymentService.DetachDrivers() Method: Return Code Values

<td>Message</td>
<td>String</td>
<td>If the method fails to execute, the error message in English is returned.</td>
</tr>
</tbody>
</table>

8.4 Method: DCIM_OSDeploymentService.UnpackAndShare()

The UnpackAndShare method will extract the drivers for the selected OS, and copy them to the specified network share. Return values for UnpackAndShare() shall be as specified in Table 9, where the method-execution behavior matches the return-code description. UnpackAndShare() method’s parameters are specified in Table 10 – DCIM_OSDeploymentService.UnpackAndShare() Method: Parameters.

No standard messages are defined for this method.

</tr>
</tbody>
</table>

8.5 Method: DCIM_OSDeploymentService.BootToNetworkISO()

The BootToNetworkISO() method is used to boot to the iDRAC pre-OS image that was already downloaded. Return values for BootToNetworkISO() shall be as specified in Table 11, where the method-execution behavior matches the return-code description. BootToNetworkISO() method’s parameters are specified in Table 12 – DCIM_OSDeploymentService.BootToNetworkISO() Method: Parameters. No standard messages are defined for this method.

</tbody>
</table>

8.6 Method: DCIM_OSDeploymentService.DetachISOImage()

This method will detach the ISO Image from the host server. Return values for DetachISOImage() shall be as specified in Table 13, where the method-execution behavior matches the return-code description. DetachISOImage() method’s parameters are specified in Table 14 – DCIM_OSDeploymentService.DetachISOImage() Method: Parameters.

8.7 Method: DCIM_OSDeploymentService.BootToPXE()

The BootToPXE() method is used to Boot to server using the PXE mechanism. Return values for BootToPXE () shall be as specified in Table 15, where the method-execution behavior matches the return-code description. BootToPXE() method’s parameters are specified in Table 16 – DCIM_OSDeploymentService.BootToPXE() Method: Parameters. No standard messages are defined for this method.

8.8 Method: DCIM_OSDeploymentService.DownloadISOToVFlash()

The DownloadISOToVFlash() method is used to download the pre-OS ISO Image to vFlash. Return values for DownloadISOToVFlash() shall be as specified in Table 17, where the method-execution behavior matches the return-code description. DownloadISOToVFlash() method’s parameters are specified in Table 18 – DCIM_OSDeploymentService.DownloadISOToVFlash() Method: Parameters. No standard messages are defined for this method.

8.9 Method: DCIM_OSDeploymentService.BootToISOFromVFlash()

The BootToISOFromVFlash() method is used to boot to the vFlash pre-OS image that was already downloaded. Return values for BootToISOFromVFlash() shall be as specified in Table 19, where the method-execution behavior matches the return-code description. BootToISOFromVFlash() method’s parameters are specified in Table 20 – DCIM_OSDeploymentService.BootToISOFromVFlash() Method: Parameters. No standard messages are defined for this method.

8.10 Method: DCIM_OSDeploymentService.DetachISOFromVFlash()

This method will detach the ISO Image from the host server.

Return values for DetachISOFromVFlash() shall be as specified in Table 21 where the method-execution behavior matches the return-code description. DetachISOFromVFlash() method’s parameters are specified in Table 22 – DCIM_OSDeploymentService.DetachISOFromVFlash() Method: Parameters.

</tr>
</tbody>
</table>

8.11 Method: DCIM_OSDeploymentService.DeleteISOFromVFlash()

This method will delete the ISO Image from vFlash. Return values for DeleteISOFromVFlash() shall be as specified in Table 23, where the method-execution behavior matches the return-code description. DeleteISOFromVFlash() method’s parameters are specified in Table 24 – DCIM_OSDeploymentService.DeleteISOFromVFlash() Method: Parameters.
Table 23 – DCIM_OSDeploymentService.DeleteISOFromVFlash() Method: Return Code Values

</tbody>
</table>

### 8.12 Profile Conventions for Operations

Support for operations for each profile class (including associations) is specified in the following subclauses. Each subclause includes either the statement “All operations in the default list in section 8.7 are supported as described by DSP0200 version 1.2" or a table listing all of the operations that are not supported by this profile, or where the profile requires behavior other than that described by DSP0200.

The default list of operations is as follows:

- GetInstance
- EnumerateInstances
- EnumerateInstanceNames
- Associators
- AssociatorNames
- References
- ReferenceNames

A compliant implementation shall support all of the operations in the default list for each class, unless the “Requirement” column states something other than Mandatory.
8.13 DCIM_OSDeploymentService Operations

Table 25 lists operations that either have special requirements beyond those from DSP0200, or shall not be supported.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Requirement</th>

9 Use Cases

This section contains object diagrams and use cases for the OS Deployment Profile.

9.1 Object Diagram

Figure 2 represents a possible instantiation of the OS Deployment Profile, including advertising the profile. The object diagram in Figure 2 shows how an instance of CIM_RegisteredProfile is used to identify the version of OS Deployment Profile with an instance of DCIM_OSDeploymentService, and its associated instances are conformant. For simplicity, the prefix CIM_ has been removed from the names of the standard classes in the figure.
9.2 Discover OSD profile

Following sequence of CIM operations shall be used to discover the implemented version of OSD profile.

1. Enumerate (namespace='root/interop', classname="CIM_RegisteredProfile")
2. Filter the returned enumeration using the property filter (RegisteredProfile="OS Deployment")
3. Result shall contain one instance of CIM_RegisteredProfile containing property version="1.0.0"

9.3 Get driver pack version and supported OS information

Following sequence of CIM Operations shall be used to retrieve the driver pack version, and supported OSs for OS deployment.

1. Follow the steps (1,2,3) from 9.2
2. Associators (objectpath= “instance returned from step 9.2.3”, resultclass="DCIM_OSDeploymentService") OR Enumerate (namespace="root/dcim", classname="DCIM_OSDeploymentService")
3. Result shall contain one instance of DCIM_OSDeploymentService
4. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = "GetDriverPackInfo"
5. Invoke method shall return the following output parameters:
   a. Version = String version
b. SupportedOperatingSystems = String array of OS names
   a. CIM_ConcreteJob

9.4 Unpack drivers and Attach to Host OS

Following sequence of CIM Operations shall be used to unpack drivers for the selected OS to a local partition, and attach the partition to the host OS.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = "UnpackAndAttach"
   c. Refer to dcim_osdeploy.mof for rest of the method input parameters and data types
4. Invoke method shall return the following output parameters:
   a. Job = object path to CIM_ConcreteJob (reports the status of unpack and attach)

9.5 Unpack and share

Following sequence of CIM Operations shall be used to extract the drivers for the selected OS, and copy them to the specified network share.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = "UnpackAndShare"
   c. Refer to dcim_osdeploy.mof for rest of the method input parameters and data types
4. Refer to the dcim_osdeploy.mof for rest of the method output parameters.

9.6 Boot to Network ISO image

Following sequence of CIM Operations shall be used to boot to the downloaded pre-OS ISO image.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = "BootToNetworkISO"
4. Refer to dcim_osdeploy.mof for method input and output parameters and data types.
### 9.7 Boot to PXE

Following sequence of CIM Operations shall be used to boot to a PXE.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = "BootToPXE"

### 9.8 Detach Drivers

Following sequence of CIM Operations shall be used to detach the USB device containing the drivers from the host server.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = "DetachDrivers"

### 9.9 Download ISO Image to vFlash

Following sequence of CIM Operations shall be used to download a pre-OS ISO image to vFlash.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = "DownloadISOToVFlash"
4. Refer to dcim_osdeploy.mof for method input and out parameters and data types.

### 9.10 Boot to ISO Image from vFlash

Following sequence of CIM Operations shall be used to boot to the pre-OS ISO image that is present in vFlash.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = "BootToISOFromVFlash"
4. Refer to dcim_osdeploy.mof for method input and out parameters and data types.

9.11 Detach ISO Image from vFlash

Following sequence of CIM Operations shall be used to detach the ISO Image from vFlash that is attached as a CD-ROM device to host server.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = “DetachISOFromVFlash”

9.12 Delete the ISO from vFlash

Following sequence of CIM Operations shall be used to delete the ISO Image from vFlash.

1. Follow the steps (1,2,3) from 9.2
2. Follow the steps (2, 3) from 9.3
3. Invoke extrinsic method using the following parameters:
   a. Object path = object path returned from 9.3.3
   b. Method name = “DeleteISOFromVFlash”

9.13 Status of current Task

Following sequence of CIM Operations shall be used to read the current status of the last method executed.

1. Enumerate (namespace=root/dcim, classname="DCIM_OSDConcreteJob")
2. Result shall contain one instance of CIM_ConcreteJob
3. The following properties of CIM_ConcreteJob shall be used to identify the state and completion status of the last executed method:
   a. InstanceID = “OSD: UnpackAndAttach: 1”
   b. Name = “UnpackAndAttach”
   c. JobStatus = “Completed | Failed”
   d. Refer to dcim_osdeploy.mof for more details on the DCIM_OSDConcreteJob properties.

10 CIM Elements

Table 27 shows the instances of CIM Elements for this profile. Instances of the CIM Elements shall be implemented as described; sections 7 “Implementation Requirements” and 8 “Methods” may impose additional requirements on these elements.
Table 27 – CIM Elements: OS Deployment Profile

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>DCIM_OSDeploymentService</td>

<tr>
<td>CIM_ElementConformsToProfile</td>
<td>Mandatory</td>
<td>See section 10.4</td>
</tr>
</tbody>
</table>

10.1 DCIM_OSDeploymentService

DCIM_OSDeploymentService is used to provide a central class for the OS Deployment profile.

Table 28 – Class: DCIM_OSDeploymentService

<table>
<thead>
<tr>
<th>Properties and Methods</th>
<th>Requirement</th>

<td>Mandatory</td>
<td>This property shall have value of “DCIM OS Deployment Service”.</td>
</tr>
</tbody>
</table>

10.2 CIM_ConcreteJob

CIM_ConcreteJob is used to track the job returned as an OUT parameter of DCIM_OSDeploymentService execute methods. This class is conditional, and shall only exist if one of the extrinsic methods of DCIM_OSDeploymentService returns a job as an output parameter.

Table 29 – Class: CIM_ConcreteJob

<table>

ANNEX B
(informative)

Items Considered but not Added to Profile

1. OSList *** Needs to be implemented by SW Inventory Provider?

We will do this using the SupportedOS property on the SoftwareIdentity instance that represents the driver package. We will need to differentiate between drivers that may be capable and/or support the following:
   - Legacy
   - UEFI

Each supported OS will be represented in the SupportedOS array property for each version of Legacy or UEFI.
