1 Introduction

This document illustrates how to configure a Cisco® Nexus 7010 chassis for use with EqualLogic™ PS Series storage using Dell™ best practices. The recommended configuration when using a single chassis is to configure two I/O modules.

For more information on EqualLogic SAN design recommendations, see the EqualLogic Configuration Guide at: www.delltechcenter.com/page/equallogic+configuration+guide.

1.1 Audience

This switch configuration guide describes a verified configuration following Dell best practices for a dedicated EqualLogic iSCSI SAN and is intended for storage or network administrators and deployment personnel.

1.2 Switch details

The table below provides an overview of the switch configuration.

| Table 1 | Switch specifications |
|----------------|
| **Cisco Nexus 7010** |
| **Switch vendor** | Cisco |
| **Switch model** | Nexus 7010 |
| **Switch firmware** | 6.2.10 |

Note: For proper functionality, the switch must be at the firmware version shown in the table above before proceeding with this configuration. Using previous firmware versions may have unpredictable results.

The latest firmware updates and documentation can be found at: www.cisco.com. This site requires a login credential.
1.3 Cabling diagram

The cabling diagram shown below represents the Dell recommend method for deploying your servers and EqualLogic arrays.

R710 server shown as an example.

Figure 1  Cabling diagram

PS6210 shown as an example.
2 Dell recommended switch configuration

These steps show you how to configure a single Cisco Nexus 7010 chassis with two I/O modules that are installed in Slot 1 and Slot 2.

**Note:** The configuration steps in this section are only recommended when the switch is used as a dedicated SAN for iSCSI traffic (not shared with LAN traffic).

2.1 Hardware configuration

1. Power on the chassis
2. Connect a serial cable to the active supervisor management port.
3. Using Putty or another terminal utility, open a serial connection session to the switch.
4. Open your terminal emulator and configure it to use the serial port (usually COM1 but this may vary depending on your system). Configure serial communications for 9600,N,8,1 and no flow control.

2.2 Delete startup configuration

**Note:** This example assumes a switch at its default configuration settings. Using the "write erase" command will set the startup configuration file to its default settings. You should always backup your configuration settings prior to performing any configuration changes.

```
switch#write erase
Warning: This command will erase the startup-configuration
Do you wish to proceed anyway ? (y/n) [n] y

switch# reload
This command will reboot the system
Do you want to continue? (y/n) [n] y
```

**Note:** The switch will reboot.
2.3 Running the basic system configuration

The following steps use the setup utility to configure connectivity for basic management of the system.

After the switch fully reboots, the following prompts will appear:

Abort Power On Auto Provisioning and continue with normal setup ?(yes/no)[n]: y

---- System Admin Account Setup ----
Do you want to enforce secure password standard (yes/no): yes
Enter the password for "admin": my password
Confirm the password for "admin": my password
Do you want to enable admin vdc (yes/no) [n]: n

---- Basic System Configuration Dialog VDC: 1 ----

This setup utility will guide you through the basic configuration of the system. Setup configures only enough connectivity for management of the system.

Please register Cisco Nexus7000 Family devices promptly with your supplier. Failure to register may affect response times for initial service calls. Nexus7000 devices must be registered to receive entitled support services.

Press Enter at anytime to skip a dialog. Use ctrl-c at anytime to skip the remaining dialogs.

Would you like to enter the basic configuration dialog (yes/no): yes
Create another login account (yes/no) [n]: n
Configure read-only SNMP community string (yes/no) [n]: n
Configure read-write SNMP community string (yes/no) [n]: n
Enter the switch name : my switch name
Enable license grace period? (yes/no) [n]: n
Continue with Out-of-band (mgmt0) management configuration? (yes/no) [y]: y
Mgmt0 IPv4 address : my IP address
Mgmt0 IPv4 netmask : my netmask
Configure the default gateway? (yes/no) [y]: y
IPV4 address of the default gateway : my gateway
Configure advanced IP options? (yes/no) [n]: n
Enable the telnet service? (yes/no) [y]: y
Enable the ssh service? (yes/no) [y]: n
Configure the ntp server? (yes/no) [n]: n
Configure default interface layer (L3/L2) [L2]: L2
Configure default switchport interface state (shut/noshut) [shut]: shut
Configure CoPP system profile (strict/moderate/lentient/dense/skip) [strict]: skip
The following configuration will be applied:

<Your settings will be displayed>

Would you like to edit the configuration? (yes/no) [n]: n
Use this configuration and save it? (yes/no) [y]: y
[########################################] 100%
Copy complete.

Log into the switch using the credentials you created.

Note: You must perform port configurations for each individual port that is connected to a storage controller or a host interface port, or you can specify a range of ports to configure. This example assumes all 48 ports on I/O Modules 1 and 2.

2.4 Enabling Jumbo Frames

```
switch# configure
switch(config)# system jumbomtu 9216
switch(config)# interface ethernet 1/1-48 , ethernet 2/1-48
switch(config-if-range)# mtu 9216
switch(config-if-range)# exit
switch(config)#
```

Note: By default, Data Center Bridging (DCB) is enabled. This document will provide steps to disable DCB. Perform all operations during a maintenance window, whereas a temporary loss of communication between host servers and storage arrays may occur.

2.5 Enabling LLDP

```
switch(config)# feature lldp
switch(config)# interface ethernet 1/1-48 , ethernet 2/1-48
switch(config-if-range)# lldp receive
switch(config-if-range)# lldp transmit
switch(config-if-range)# exit
switch(config)# exit
```
2.6 Disabling Data Center Bridging (DCB)

All steps in Section 2.6 are required in order to properly disable DCB. Also, when upgrading from previous versions to version 6.2.10, Section 2.6 must be performed to properly disable DCB.

```
switch# configure
switch(config)#lldp tlv-select dcbxp
switch(config)#copy running-config startup-config
switch(config)#no lldp tlv-select dcbxp
switch(config)#exit
switch#copy running-config startup-config
```

**Note:** The above steps are needed due to Cisco Bug Number “CSCuo63486 LLDP - link err-disabled upon reload when dcbx tlv is disabled”.

2.7 Enable link level flow control (802.3x)

You must perform this step for each individual port that is connected to a storage controller or a host interface port, or you can specify a range of ports to configure.

```
switch# configure
switch(config)#interface ethernet 1/1-48 , ethernet 2/1-48
switch(config-if-range)#priority-flow-control mode off
switch(config-if-range)#flowcontrol send on
switch(config-if-range)#flowcontrol receive on
switch(config-if-range)#exit
```

2.8 Configure portfast on edge ports

```
switch(config)#interface ethernet 1/1-48 , ethernet 2/1-48
switch(config-if-range)#spanning-tree port type edge
```

**Warning:** edge port type (portfast) should only be enabled on ports connected to a single host. Connecting hubs, concentrators, switches, bridges, etc... to this interface when edge port type (portfast) is enabled, can cause temporary bridging loops. Use with CAUTION.

Edge Port Type (Portfast) will be configured in 96 interfaces due to the range command but will only have effect when the interfaces are in a non-trunking mode.

```
switch(config-if-range)#exit
```
2.9 Enable switch ports

The following example enables a range of ports. If preferred, you may enable individual ports as needed.

```
switch(config)# interface ethernet 1/1-48, ethernet 2/1-48
switch(config-if-range)# shutdown
switch(config-if-range)# no shutdown
switch (config-if-range)# exit
```

2.10 Save configuration

```
switch#copy running-config startup-config
```
